A Few of the Leading Articles in Volume Nine

WRITTEN AND SIGNED BY SPECIALISTS

ITALY ..... THIRTY-ONE SPECIAL ARTICLES
See Department of Italian History and Development

ITO, HIROBUMI, MARQUIS ..... WILLIAM ELLIOT GRIFFIS
Author of 'The Mikado's Empire'

JACKSON, ANDREW ..... W. N. C. CARLTON
Librarian Trinity College, Hartford

JACKSON, THOMAS JONATHAN ..... J. WILLIAM JONES
Formerly Secretary Southern Historical Society

JAPAN ..... TWENTY SPECIAL ARTICLES
See Department of Japanese History and Development

JAY, JOHN ..... ALTON B. PARKER
Late Chief Judge of the Court of Appeals, State of New York

JEFFERSON, THOMAS ..... J. A. C. CHANDLER
Formerly Professor of History and Literature, Richmond College, Richmond, Va.

JESUITS ..... T. J. CAMPBELL, S. J.

JESUS CHRIST ..... DAVID FOSTER ESTES
Professor of New Testament Interpretation, Hamilton Theol. Sem., Colgate University

JEWISH FRATERNITIES; JEWISH SECTS ..... ABRAM S. ISAACS
Professor of Semitic Languages, New York University

JOHNSON, SAMUEL; KEATS, JOHN ..... WILLIAM P. TRENT
Professor of English, Columbia University

JONES, JOHN PAUL ..... CYRUS TOWNSEND BRADY
Author of 'Life of Commodore Paul Jones'

JONSON, BEN ..... ASHLEY H. THORNDIKE
Professor of English, Columbia University

JOURNALISM ..... CHARLES EMORY SMITH
Editor 'The Press' Philadelphia

JUDAISM ..... TWENTY-THREE SPECIAL ARTICLES

JUDGE; JUDGMENT; JURISDICTION; JURY ..... JOHN DOUGLAS BROWN
Philadelphia

JUSTIFICATION ..... REV. P. A. HALPIN
Saint Angela's College, New Rochelle, N. Y.

JUTE; LACE ..... CHARLES RICHARDS DODGE
Commercial Fibre Expert, Washington, D. C.

JUVENAL ..... NELSON G. MCGREA
Professor of Latin, Columbia University

KANSAS ..... JAMES L. KING
Kansas State Librarian

KANSAS-NEBRASKA BILL ..... ALBERT WATKINS
Editor 'History of Nebraska'

KANT, IMMANUEL ..... JAMES E. CREIGHTON
Professor of Philosophy, Cornell University

KIDNEYS ..... D. D. ROBERTS, M.D.
Brooklyn, N. Y

KILLER ..... F. W. TRUE
Curator of Mammals United States National Museum

KILN POTTERY ..... CHARLES F. BINNS
Director New York State School of Ceramics

KINDERGARTEN IN AMERICA ..... SUSAN E. BLOW
Author of 'Letters to a Mother'

KINETOGENESIS; LAMARCKISM ..... ALPHEUS S. PACKARD
Late Professor of Zoology, Brown University

KIPLING, RUDYARD ..... WILBUR L. CROSS
Professor of English, Yale University

LABRADOR ..... A. P. LOW
Of the Geological Survey of Canada

613840

LAMB, CHARLES; LANDOR, WALTER SAVAGE.....WILLIAM T. BREWSTER
Professor of English, Columbia University

LANDSCAPE GARDENING.....EDMUND BUCKLEY
Editor 'University Lessons in Art'

LARVA; LATERAL LINE ORGANS.....J. S. KINGSLEY
Professor of Zoology, Tufts College

LATIN-AMERICAN LITERATURE.....M. M. RAMSEY
Assistant Professor of Spanish, Leland Stanford Jr. University

LATIN LANGUAGE; LATIN LITERATURE.....EDWARD PARMELEE MORRIS
Professor of Latin, Yale University

LATIN WRITERS.....WALTON BROOKS MCDANIEL
Assistant Professor of Latin, University of Pennsylvania

LAW, AMERICAN SCHOOLS OF.....C. VEY HOLMAN
Lecturer on Mining Law, University of Maine

LAW, COMMON, IN AMERICA.....HERBERT PARKER
Attorney General, State of Massachusetts

LAW, CONSTITUTIONAL.....JAMES WILFORD GARNER
Professor of Political Science, University of Illinois

LAW, MILITARY.....BRIG.-GEN. GEORGE B. DAVIS
Judge Advocate-General U. S. Army

LAW OF FAMILY; LAW OF HUSBAND AND WIFE.....PAUL JONES
Attorney at Law, New York

LAWNS, THE PREPARATION AND CARE OF.....M. G. KAINS
Crop Expert

LEAD INDUSTRY IN AMERICA.....EDWARD S. FARROW
Consulting Mining Engineer, New York City

LEAST SQUARES, METHOD OF.....HAROLD JACOBY
Rutherfurd Professor of Astronomy, Columbia University

LEAVES.....ERNEST INGERSOLL
Naturalist; Author of 'Wild Life of Orchard and Field,' etc.

LEE, ROBERT E.....FITZHUGH LEE
Late Brig.-Gen. U. S. A.

LEIBNITZ, GOTTFRIED WILHELM.....A. E. TAYLOR
Frothingham Professor of Philosophy, McGill University, Montreal

LENS.....EDWARD BAUSCH
Of the Bausch & Lomb Optical Co., Rochester, N. Y.

LEO XIII.....MAURICE FRANCIS EGAN
Formerly Professor of Literature, Catholic University of America

LEPIDOPTERA.....W. J. HOLLAND
Director Carnegie Museum, Pittsburg, Pa.

LIBRARY ADMINISTRATION; LITERARY LABOR SAVERS.....MELVIL DEWEY
Formerly Director of the New York State Library

LICHENS.....FREDERIC E. CLEMENTS
Assistant Professor of Botany, University of Nebraska

LIFE SAVING SERVICE, UNITED STATES.....HORACE L. PIPER
Assistant General Superintendent, Life Saving Service

LIGHT.....CHARLES S. HASTINGS
Professor of Physics, Sheffield Scientific School, Yale University

LINCOLN, ABRAHAM.....EUGENE PARSONS
Author and Editor

LINSEED OIL INDUSTRY.....SPENCER KELLOGG
Of Spencer Kellogg Company, Buffalo, N. Y.

LITERATURE.....THOMAS GAFFNEY TAAFFE
Instructor in English, College of the City of New York

LITERATURE, CANADIAN.....J. MACDONALD OXLEY
Author of 'The Romance of Commerce,' etc., Toronto

LITHOGRAPHY.....OTTO W. WILHELMS
Of Sackett & Wilhelms Lithographing and Printing Company, New York

LIVE STOCK.....LAZARUS N. BONHAM
Ex-Secretary State Board of Agriculture

LIVER.....ALFRED STENGEL, M.D.
Professor of Clinical Medicine, University of Pennsylvania

LIVERPOOL, ENGLAND.....GEORGE T. SHAW
Master and Librarian, The Athenæum, Liverpool

CONTENTS

DEPARTMENT OF

ITALIAN HISTORY AND DEVELOPMENT

1. PHYSICAL GEOGRAPHY ..... GUISEPPE DALLA VEDOVA
Professor of Geography in the Royal University of Rome; Academician of the "Lincei" and other scientific societies; etc.

2. ITALIAN ARCHÆOLOGY ..... GIOVANNI PATRONI
Professor of Archæology, Royal University of Pavia

3. HISTORY OF THE MIDDLE AGES ..... GIOVANNI MONTICOLO
Professor of Modern History, Royal University of Rome

4. THE RENAISSANCE ..... PIO CARLO FALLETTI
Professor of Modern History, Royal University of Bologna

5. MODERN HISTORY (1492–1815) ..... PIETRO ORSI
Professor of Modern History, Royal Lyceum of Venice

6. HISTORY FROM 1815 TO 1907 ..... BENIAMINO MANZONE
Director of the Historical Review of Italian Risorgimento

7. POLITICAL ADMINISTRATION ..... VICTOR EMANUELE ORLANDO
Minister of Justice of the Kingdom; Professor of Common Law, Royal University of Rome; Member of Parliament; Ex-Minister of Public Instruction

8. CROWN AND PARLIAMENT ..... GIORGIO ARCOLEO
Professor in Ordinary of Constitutional Law, of Comparative Public Law, Royal University of Naples; Grand Official of the Italian Crown; Ex-Deputy in Parliament for six legislatures; now Senator for life of the Kingdom

9. COMMUNAL AND PROVINCIAL ADMINISTRATION ..... FEDERICO CAMMEO
Professor of Jurisprudence, Royal University of Padua; author of 'Administrative Law'; 'Communal Law'; 'Municipal Monopolies'; etc.

10. DEPARTMENT OF JUSTICE ..... ETTORE SACCHI
Member of Parliament; formerly Minister of Justice of the Kingdom; author of Works on Functions and Limitations of Tribunals and Courts of Appeal

11. THE PAPACY AND THE GOVERNMENT ..... DOMENICO ZANICHELLI
Professor of Constitutional Law, Royal University of Pisa; Honorary Professor of the University of Siena

12. POLITICAL PARTIES ..... GAETANO MOSCA
Professor of Constitutional Law, Royal University of Turin

13. ITALIAN SOCIALISM ..... JOSEPH SPENCER KENNARD
Author of 'Italian Romance Writers'; etc.

14. THE ITALIAN ARMY ..... GENERAL FORTUNATO MARAZZI
Member of Parliament; formerly Secretary of State for War

15. THE NAVAL MARINE ..... COUNT CANDIANI
Admiral of the Royal Italian Navy

16. RELIGION ..... ALESSANDRO CHIAPPELLI
Professor of Philosophy, Royal University of Naples; Commendatore della Corona d'Italia; author of 'The Philosophy of Religion'; etc.

17. EDUCATION ..... SAVERIO DE DOMINICIS
Professor of Pedagogy, Royal University of Pavia; author of Works on Teaching, Schools and Universities

18. SCHOOLS AND UNIVERSITIES ..... VITTORIO PUNTONI
Rector of the Royal University of Bologna

19. THE EDUCATION AND SOCIAL STATUS OF WOMEN ..... COUNTESS FANNY ZAMPINI SALAZER
Authoress; Professor of English, Royal Institute of Higher Learning for Women in Rome

20. LANGUAGE ..... ERNESTO G. PARODI
Professor of the Comparative History of the Classic and Neo-Latin Languages, Royal Institute of the Higher Studies, Florence; author of 'Tuscan Dialects'; etc.

21. LITERATURE ..... JOSEPH SPENCER KENNARD
Author of 'Italian Romance Writers'; etc.

22. ART, ANCIENT ..... LUCIO MARIANI
Professor of Archæology, Royal University of Pisa

23. ART, ITALIAN ..... ADOLFO VENTURI
Professor of the History of Art, Royal University of Rome

24. THE NATURAL AND PHYSICAL SCIENCES ..... B. DESSAU
Professor of Physics, University of Perugia

25. ITALIAN MUSIC ..... MAESTRO CARLO CORDARA
Musical Critic of 'Marzocco'; Composer of Operas, Symphonies and Oratorios

26. ECONOMIC CONDITIONS ..... AUGUSTO GRAZIANI
Professor of Political Economy, Royal University of Naples; Honorary Professor, University of Siena; Member of the Academy "Lincei" of Rome and of the Academy "Pontaniana" of Naples

27. AGRICULTURE ..... PAOLO CASCIANI
Member of Parliament; Commendatore della Corona d'Italia; Professor of Agrimony, Royal University of Rome

28. COMMERCE ..... ARTURO JEHAN DE JOHANNIS
Director of the Royal Institute of Social Science, Cesare Alfieri, Florence

29. FINANCE ..... HON. GIULIO ALESSIO
Member of Parliament; formerly Secretary of State for the Treasury; Professor of Finance, Royal University of Padua

30. EMIGRATION ..... RICCARDO DALLA VOLTA
Professor of Political Economy and Finance in the Royal Institute of Social Science, Cesare Alfieri, Florence; Honorary Professor, University of Padua; author of Works on Social Economics

31. ITALIANS IN AMERICA ..... AMY A. BERNARDY
Professor of Italian and Romance Languages and Literature, Smith College

ITALY:

HISTORY AND MODERN DEVELOPMENT.

1. **Italy—Physical Geography.** *Geographical Position.*—Italy lies in the South of Europe, and occupies the middle place of the three peninsulas—Spain and Portugal, Italy, and the Greek Illyrian peninsula, forming the extreme European extensions toward Africa and Asia. Italy is almost in the middle of the Temperate Zone.

The distance of its various portions from the Equator (latitude) is about the same as the distance from the Equator of the New England States of America, of New York, Pennsylvania, New Jersey, Maryland, Virginia, and of the Western States lying in the same zone.

As to its distance from the United States from West to East (longitude) it can best be understood by the difference in time between the two countries. In Italy this distance can be estimated from the capital, Rome, which is almost in the centre of Italy from East to West. Between the meridian of Rome and that of New York there is a difference of about 5¾ hours, so that when it is mid-day at Rome it is a quarter past six in the morning of the same day at New York.

Perimetric Configuration.—Italy, which by reason of its characteristic form in the atlas has been compared to a boot, is divided geographically into three parts: (1) Continental Italy, partially bounded and traversed by a portion of the Alps and the Northern Apennines, and bounded on the east by the Gulf of Venice, which is wider from east to west than from north to south; (2) Peninsular Italy, a little more extensive than the Continental portion, situated from N. W. to S. E. bounded on three sides by the Mediterranean Sea, which takes the distinctive name of Tyrrhenian Sea, of Tuscany towards the S. W.; of the Ionian Sea towards the S. E. and of Adriatic towards the N. E.; (3) Insular Italy, which comprises, besides numerous smaller islands, the large islands of Sicily, Sardinia, and Corsica, which enclose the Tyrrhenian Sea on the South and West.

Historical Position.—On account of its situation in the midst of the Mediterranean, into which it extends from the continent of Europe like a natural mole, 1,000 kilometers long from N. W. to S. E., and being flanked at an inconsiderable distance by two other peninsulas, it was specially favorably situated to play a prominent part in the history of human progress, and particularly until the discovery of America, *i. e.* during the many centuries in which, before the conquest of the Atlantic Ocean, there were concentrated in the Mediterranean the most successful efforts, and the most glorious annals of human history. No country of Europe can compete with Italy in worthy historical memories, both in the ages of antiquity and in the Middle Ages; and from the middle of the 10th century to the present time, after the cutting of the Isthmus of Suez, the importance of the Mediterranean has again greatly increased, and as the federation of almost all the Italian states into one kingdom occurred about this time, there began for Italy a new historical period in which are already evidences of new progressive growth in the country.

Boundaries.—The boundaries of Peninsular Italy are the three seas already mentioned; but on the continental and insular portions there are different opinions. There is no question regarding the political boundaries, since Italy is politically bounded by the confines of the kingdom, which were recognized in the last treaties, and liable to be changed by subsequent treaties. The difficulty arises in regard to what are called natural boundaries; and for the reason that various authors start from different standpoints—some taking purely geographical lines; others ethnographical, or linguistic; others military, or historic boundaries, etc. And on this point it is not that the Italian writers differ only with foreign authorities on the subject, but they also differ among themselves. And this is not unnatural. Along the boundary line between Italy and the European Continent there have been through the ages so many historical happenings and so many different races, that the distinguishing traits of nationality and language are no longer clearly defined, but are misled and blended in promiscuous belts, which must account for the varied opinions of the writers. But it must be remembered that the ethnographical, linguistic, military and historical data referring to the past, present, or future distribution of tongues, and political or social institutions belong properly to anthropological and sociological geography, whilst physical geography, of which alone we are treating at present, deals with nothing but the physical characteristics of a country. Therefore the clearest and simplest way of treating of a peculiarly mountainous region is the orohydrographic point of view by which we begin by tracing on the immense extent and variety of forms of the Alps the dividing line between the water sheds of the opposite regions. This leaves well defined the principal part at least, if not all of the northern boundaries along the Alps, following the line which separates the water sheds of the Rhone, the Rhine and the Danube, which have nothing to do with Italy, from those of the Po, the Adige, and other Alpine rivers which undoubtedly belong to Italy. But even in regard to these physical boundaries there is a difference of opinion as to where should be fixed the extreme limits of the East and West boundaries of the continental portion and the exact limits of the fluviatic basins.

Other uncertainties may arise, and for the

ITALY.

same reason, although in lesser proportion, even in the insular portions of Italy which gave rise to controversy regarding the assignation to Italy of certain islands in the Dalmatian Archipelago and in the Sicilian Sea. As for the remaining islands, both large and small, geographers as well as geologists assign them to geographic Italy, on account of their proximity to the mainland, as well as to their geological formation, to the shallowness of the water between them and the mainland, etc.

Extent.—The natural, or geographical extent of Italy computed according to this standard gives the following figures:

	Sq. Km.
Continental and Peninsular Portion	236,464.7
Insular Portion—Sicily	25,461.2
Sardinia	23,833.3
Other islands in the Tuscan Archipelago: Elba, Giglio, Capraja, Pianosa, Pontine Islands, Campanian Islands, Ischia, Capri, Procida. Sardinian Islands: S. Antioco, S. Pietro, Asinara, Maddalena, Capera, Tavolara. Æolian Islands: Lipari, Salina, Vulcano, Stromboli, Filicudi, Ustica. Acgadi Islands: Favignana, Maritimo, Pantelleria, Tremiti Isles, and other smaller ones with an entire inclusive area of 921.8 sq. kilometers	50,217.3
Total area of Kingdom	286,682.0

There is included in these figures the area of certain lands (420 km.) belonging to the kingdom, but not part of it according to the accepted geographical definition. Subtracting this we have:

	Sq. Km.
Geographical area of Italy	286,262
Area geographically not belonging to the kingdom; Republic of S. Marino, 89 Km; French region of the Maritime Alps and Corsica, 9,196 Km; Swiss region, 3,872 Km; Austria region, 21,848 Km; Malta and adjacent isles, 303 Km	35,308
Total geographical area of Italy	321,570

Of this extent of area 40 per cent. belongs to Continental Italy; 42 per cent. to Peninsular portion, and 18 per cent. to the islands. The kingdom of Italy comprises 89 per cent. of this.

Taken altogether Italy belongs to the regions of small dimensions. In Europe her area is exceeded by that of Russia, Austria-Hungary, Germany, France, Spain, and Sweden. The kingdom of Italy, therefore, amounts in area to only the 25th part of that of the United States of America, and exceeds slightly the area of the New England States and New York combined.

Sea Coast.—By reason of its special shape and position, of its extending into the midst of the sea and of the many islands which belong to it, geographical Italy has a very extended coast line, of which only 51 per cent. belongs to the mainland and the rest to the islands. On that account, when we compare the extent of its coast line with its area we find that each territory of 36.5 sq. km. has a right to one kilometre of coast line. That is to say, that the length of the coast line is sufficient to enclose a circular area more than four times as large as the area of Italy. And that is why owing to this superabundance of coast, which is one of the fundamental conditions for the development of maritime activity, Italy has no naval superior in Europe, except in Great Britain.

However, the historical or sociological value of these coasts is very diverse. In the first place they are not sufficiently indented, as for instance, are the coasts of Great Britain. Moreover, there are long stretches of coast without natural landing facilities or harborage for vessels of considerable tonnage.

The northerly portion must be excepted as it carries on an extensive internal and foreign commerce, which by its exports and imports greatly stimulates maritime activity.

The uniform coasts of the Adriatic are especially poor in good harbors, as are the steeper and more varied coasts of the Ionian Sea, of Tyrrhenian Calabria, and of the more westerly isles.

With all this there are more favored tracts of coast, especially along the Tyrrhenian Sea, where the coast is often precipitous and forms an uninterrupted series of gulfs with high promontories beneath which the beach curves in large semi-circles. But the most favored of all are the small but attractive Gulf of Spezzia, best adapted by nature to the military requirements of the country; the splendid Bay of Naples, the richest in natural attractions, the centre of the greatest agricultural and fishing industries, towards which are attracted the commercial interests of almost the whole of Southern Italy; and the spacious Gulf of Genoa, with its magnificent Riviera of Levante and of Ponente, almost without any lowland, particularly the Levant Riviera, which is cultivated like a garden. From this Gulf of Genoa extend the principal thoroughfares to the chief industrial provinces of Italy, and towards the richest European countries outside of Italy. On the Adriatic Sea the opening of the Suez Canal restored the old-time international value of the Brindisi coast, and that of the less ancient, but much larger, Venetian coast. And the fisheries of the same gulf and its lagoons give a still greater value to certain small inlets and indentations in the coast, which suffice for the moderate needs of fishing boats.

Oro-Hydrographic Conformation.—The surface of Italy is chiefly mountainous. The largest Italian plain, slightly above sea level, extends through the continental portion, *i. e.* in Northern Italy. This plain has an area of about 46,000 sq. km., hence, the same as the combined area of New Hampshire and Vermont.

Peninsular Italy, and especially the islands, is covered for the most part with mountains and hills, between which are numerous valleys diverse in appearance and extent; some quite large, particularly along the lower course of large rivers, and in the vicinity of the sea coast. In the regions traversed by the largest chains of the Apennines there are some vast and high valleys entirely enclosed by opposite chains of mountains, such as the tableland of Aquila (Aterno), of Rieti (Velino), and of Perugia (Alto Tevere.) But all the plains of Italy, taken together, represent but a third part of the entire area distributed in various regions, in varying proportion, so that the mountainous area is equal to about 56 per cent. of Northern Italy; and 67 per cent. of Central Italy; 60 per cent. of the islands of the kingdom. The mountainous area is even greater in those portions of the Italian regions outside the kingdom.

The Plains.—The great Southern plain is formed by the level portion of the river basins

of Po in Venetia and Romagna. In Middle Italy the larger plains extend along the Tyrrhenian Coast in varying width between the Magra and Terracina, and flank the middle and lower banks of the Tiber, the Arno, and the Ombrone. In the South these plains are in the classic Campania felice, on the sides of the Garigliano and Volturno, and towards the Adriatic form the tableland of Apulia. In the islands the largest plain is that of Campidano in Sardinia.

These plains are formed chiefly by alluvial deposits caused by the agency of atmospheric forces and by erosion of the base and flanks of the surrounding mountains, and distributed by currents of water in areas, which primarily, at least in certain localities, were seas. We find this in the greatest proportion in the valleys of the Po and Venetia, which geologists assure us were in former days a portion of the present Gulf of Venice, which extended like a deep indentation as far as Piedmont.

Mountains.—The mountains of Continental and Peninsular Italy are divided into two systems: that of the Apennines, and that of the Alps. The island mountains are considered, particularly by geologists, as continuations, to a greater or less extent, of the mainland chains. The system of the Apennines belongs entirely to Italy. This is not the case with the Alps, which extend for the most part into other countries, as France, Switzerland, and Austria-Hungary. They form, as has been said, the land boundaries of Italy, not in the sense that Italy terminates at their Southern base, although we consider as geographically Italian—as previously mentioned—all the Alpine regions whose streams empty into the River Po, and into the Venetian rivers.

To this belong partly or entirely many of the great Alpine colossi, such as Mt. Viso (3,843 metres), in the Cotian Alps the Gran Paradiso (4,061 metres), in the Gratian Alps, Mt. Blanc (4,810 metres), and Monte Rosa (4,638 metres) in the Pennine Alps, or Valletian Alps, the Adula (Rheinwaldhorn, 3,398 metres) in the Lepontine Alps, the Bernina (4,052 metres), the Orteles (3,905 metres), the Adamello (3,557 metres), the Wildspitze (3,770 metres) in the Rhetian Alps, the Vedretta Marmolata (3,370 metres) in the Dolomitic, or Cadorine Alps, and many others. And the most important thing to observe is, that in this part of Italy there arise from the great plains of the Po and Venetia numerous valleys, many of which are situated in an almost normal direction to the geographical axis of the whole system, and pursue a relatively short course from the Italian lowlands to the heart of the whole mountain region, reaching almost to those long longitudinal, or oblique valleys of the Upper Rhone, the Upper Rhine, the Inn, the Drave, etc., which are characteristic of the non-Italian Alpine watersheds, and which lead to the flourishing European countries situated on the slopes of the whole mountain system.

Through this singular conformation, the passes, the cols, the saddles, which are found along this boundary were necessarily destined to become the doors of communication between the inhabitants of either water-shed, with the double difference—serious on account of its advantages, as on account of its perils—that, in the first place, in the North one can reach these passageways by long valleys of easy ascent, whilst to the South one has to climb a more precipitous ascent. As T. Fischer says, these gateways are adapted rather to enter Italy than to leave it; and, again, these passes radiate and diverge in three directions from Italy as a centre—to the West, North, and East—towards the three principal centres of European population, and these three nations all have on the side of the Mediterranean only one neighbor, whilst Italy, on the North, has to deal with three.

The Apennines.—As for the Apennines, they form geographically, and not geologically, the continuation of the Maritime Alps across the Gulf of Genoa, enclosing on the South, Continental Italy. They then turn their axis in an oblique direction from N. W. to S. E., traversing the whole of Peninsular Italy. They form a great curve with the concave portion towards the Tyrrhenian Sea, and in Central Italy they extend their principal masses rather towards the Adriatic, approaching then the Tyrrhenian Sea in Southern Italy, *i. e.* the Campania, the Basilicata, and Calabria. Geographers now make the dividing point between the Alps and the Apennines the Col di Cadibona, or Altar Pass (426 metres high), in the W. N. W. of Savona. The Apennines form neither a single, nor a continuous chain; but from the principal branch they separate into several spurs and ramifications, or the main chain spreads out in clusters or groups of mountains with terraces, and noted tablelands, such as those of Aquila, Rieti, and Perugia, or divide into a number of chains more or less parallel to each other. Geologists do not attribute to the proper Apennines many of the mountains in the Western part of the peninsula—which includes a great part of Tuscany, of Latium, of the Campania, and some portions of Calabria—the mountains and tablelands of Apulia, the volcanoes and part of the peloritani, in Sicily, all those of Sardinia, of Corsica, of the Tuscan Archipelago, and many others. The groups and chains, denied by geologists to the Apennines, are assigned by them to other formations, belonging to an earlier geological period, which makes the geography of Italy assume a very different aspect.

Certainly the geological variations found in the study of these lands have great value, not alone in the line of science, but also in regard to the present orographic surfaces, to their permanency, and to their mineral and vegetable products, with all the consequences that ensue in the various regions owing to the habitation of man. Geography shows us primarily that the mountains of the peninsula, as compared with the Alps, are not of any great extent or elevation, none of them attaining a height of 3,000 metres—except Mt. Ætna, which is out of the peninsula and is a volcano,; that the greater number of them are scarcely 2,000 metres high. The highest peaks are found in the most mountainous part, within the limits of the Marches of Abruzzo, which contains the greatest mountain masses of the Apennines and the highest tablelands in the peninsula. In this region is Mt. Vettore (2,475 metres) in the Sibilline Mountains between Nera (Tiber) and Tronto; the Peak of Sevo (2,477 metres), to the right of the source of the Tronto; Terminillo (2,212 metres) to the right of Upper Velino (Nera

Tiber); the Gran Sasso d'Italia (The Great Rock of Italy) to the right of Upper Vomano, with many points higher than 2,000 metres, and Monte Corno (2,921 metres), which is the highest peak in the peninsula. Majella has also similar altitudes, among which the highest is Monte Amaro (2,795 metres) to the left of the source of Aventino (Sangro); then Mt. Velino (2,487 metres); Sirente (2,349 metres); Mt. Petroso (2,247 metres); Mt. Meta (2,241 metres); Viglio (2,150 metres), and about ten others. There are few considerable altitudes in the rest of the peninsula, one or two in the S. W. of the Basilicata, none in the islands except Ætna, and a few summits in Corsica, among which the highest is Monte Cinto (2,710 metres).

Compared with other and less mountainous countries useful minerals are relatively scarce in Italy. A young country, from a geological point of view, it does not possess in its Apennines such mineral products as are furnished by more ancient formations and which are an element of power to other European nations. Iron ore is mined specially in the not extensive island of Elba; other metals, but not in large quantities, are found in Sardinia, and the Alps of Lombardy and Venetia. Fossil carbon, of the best quality, is not found everywhere; on the other hand, much sulphur is found, especially in Sicily. Statuary marble is found in Tuscany, in the Apuan Alps, and always in places where the mountains are not of the formation assigned by geologists to the Apennines. But the fact remains that the mineral products do not constitute a factor in the wealth of Italy.

If we finally consider the Apennines in their general external aspects, the observing traveler who has crossed the Alps will find that the mountains of the peninsula differ from them not alone in height, but also in other special characteristics. There is wanting in the Apennines in almost all their extent, the fearful and wild grandeur of much Alpine scenery; there are wanting the glaciers and the perpetual snow; there is wanting the Alpine vegetation, so rich in varied tints and extending in some parts to the most unusual altitude. The Apennines, on the contrary, are less ponderous, less dentated, less varied, less severe and precipitous, the valleys less narrow and hemmed in, but also with scantier and less varied vegetation, and with many barren tracts, showing the bare sides of rock.

But as a compensation there are numerous large and pleasant valleys in almost every direction, where the regular sections of land, with a variety of cultivation, with verdant hills and mounts covered with villages, with a sky that is very often bright, makes a pleasing contrast to the barrenness of the distant mountains.

Rivers.—The outline and character of the Italian mountains is pretty clearly found in the physical hydrography, in the climate, in vegetation, and finally, in the great lines of Italian history.

Beginning with the waters we find in the North, as well as the largest plain, the largest river of Italy, the Po, which crosses the entire valley in its greatest extent from west to east, and which, in proportion to the modesty of its length (only 420 km. in a straight line), it may be considered to have the greatest volume of water of any river in the world. The hydrographic basin of the Po and its tributaries is estimated as at least 70,000 km., a great area for a river of that length; for to every kilometre of its course there is more than 104 km. of tributary area.

The amount of water that the Po carries to the sea (greater in the seasons of the heavy rains and the melting of the snows), is always quite large, for the reason that when the contribution of the Alpine tributaries, the Adda, Ticinus, etc., is less abundant, *i. e.* in winter, that of the Apennines' tributaries, the Panaro, Taro, etc., is more so. The volume of water is greater in October and May, and it often does great damage to the surrounding regions. However, notwithstanding all this abundance of water, the Po, as a medium of navigation, does not present the facilities that might be expected, for it works potently and unceasingly to change, not only its banks, but also the position and extent of its many sand and mud banks; and its various outlets into the sea are neither ample, nor deep, nor permanent. Its waters carry and deposit around and about its mouth in the Adriatic great quantities of mud, which gradually form an extension of its mouths into a belt of land estimated to increase about 75 metres a year. These deposits would be larger still, if the waters contributed by its most important Alpine affluents, the Adda, Ticinus, Oglio, and Mincio, were not purged of all detritus, which they get rid of in crossing the Lombard lakes.

Among the Alpine rivers which flow into the Adriatic must be mentioned the Adige, which, as compared with the Po, is inferior in the length of its course by only about a third, but is also four-fifths smaller in the amplitude of its hydrographic basin, and still less in its volume of water.

In the peninsular portion and in the islands of Italy, the not extensive area and the special distribution of the mountains do not permit the formation of large rivers; those on the Adriatic coast of the peninsula, where are found the principal groups of the Apennines, are the smallest. Here, on account of their short and precipitous course, the rivers are more like torrents, except the Reno, which traverses the Romagna plain for a long stretch, and some that rise behind the crest of the coast chain in its ponds and recesses, as the Sangro, the Pescara, etc. Also in the Ionian Sea similar causes, and besides the prolonged drought in summer, withdraws every value also from the larger rivers, such as the Busento, the Bradano, etc. But to the west of the Adriatic chain of the Apennines there is more diversity and less uniformity in their knots and sinuosities, for being more numerous they can form valleys in directions more or less oblique to the coast line, uniting longitudinal tracts of valley to transverse tracts, and hence they can develop into larger rivers, with more extensive basins, as the Tiber, the Arno, the Volturno, the Liri-Garigliano, etc.

The Tiber, the river of universal historic fame, is the largest river of peninsular Italy. Its length is almost equal to that of the Adige, but its hydrographic basin is more than one-fourth larger. Its sources (Monte Fumajolo) are about 240 km. distant from those of its most Southern affluents, the Annene and the Teverone (Monte Viglio) in a direct line from N. N. W. to S. S. E. It receives the waters of

almost the entire Tyrrhenian water-shed from the greater Apennine groups. For that reason, especially from autumn to spring, it is liable to frequent floods, according as the downfall of rain, and the melting of the snows occur in one or other, or all parts of its vast basin. The country, and chiefly the city of Rome, suffered greatly from these floods until the recent works of systemization in the city, which formerly saw how every year, and even several times a year, the river invaded and overflowed the lower wards to a depth of three to four metres. The Tiber also continues by means of deposits to extend its estuary. From the time of Christ up to our day it has added a stretch of beach more than four kilometres wide.

The Arno, the Tuscan river, so celebrated in the history of civilization and so dear to votaries of the arts, has a course only three-fifths as long as that of the Tiber, and hardly half the extent of its basin. Its principal valleys may be distinguished by natural diversities very marked in four regions, *i. e.* in the Casentina, or Casentine Val d'Arno, wider and less impetuous up to its junction with the Tuscan Chiana; the Upper Val d'Arno, shut in between the opposite chains of the Pratomagno and the Chianti; and the lower Val d'Arno, from its confluence with the Sieve until it reaches the sea, the most flourishing portion of Tuscany. But even in this last region it recalls the type of torrent, as much by the coarse deposits from the bed of the river as by the tremendous force and agitation of its waters. At Florence it may rise from a minimum flow of three cubic-metres to a maximum flow of 1,000 c.m., and in exceptional cases to 2,000 c.m. of water a second. And at Pisa, on the level plain, it may fall from 2,000 c.m. at flood to a low level of 15 c.m. a second. Its flood tides are most often in December, and in the preceding and subsequent months. Its lowest tide is in summer. The matter deposited at its mouth from the time of the Romans up to the present day forms a stretch of beach more than eight kilometres wide.

Lakes.—Among the Italian lakes worthy of special mention are the beautiful Lombardy lakes, Lago di Garda, or Benaco, 370 sq. km. in extent; Lago Maggiore, or Verbano, 212 sq. km.; Lago di Como, or Latrio, 146 sq. km.; Lago di Lugano, or Ceresio, d'Iseo, or Sebino, di Varese, etc., which are long valleys enclosed between spurs of the Alps, shut in and protected towards the North by the mountain, more open towards the South, and girdled by abandoned moraine hills, by ancient glaciers, with less imposing scenery, in general, than that of the Alpine lakes of Switzerland, but yet more pleasant on account of the smiling Southern landscape and vegetation; great basins of deposits, where the abundant waters of the rivers are purified before irrigating the luxuriant Lombard country. In other parts of Italy are scattered smaller lakes, historically famous, as the Trasimeno, or Lake of Perugia, 130 sq. km.; the Lago di Bolsena, 115 sq. km.; the Sabatino or Bracciano Lake, of Vico, of Albano, of Nemi, not far from Rome, situated in the craters of spent volcanoes; and many coast lagoons, such as the Venetian lagoon, the ample Val di Comacchio, situated North of Ravenna, the Lakes of Lesina, of Salpi to the North and South of the spurs of Gargano, and several others.

Climate.—There is a great diversity of climatic conditions in the different regions of Italy, caused not alone by the difference in latitude, but also the multiplicity of the ramifications of its principal mountain systems.

Italy is very long from North to South compared with other countries. The German Empire, for instance, with an area of over 540,000 sq. km., covers less than 8° of latitude; the kingdom of Italy, which is a little over half as large as Germany, covers more than 10°. Hence it follows that in the most northerly regions the sun does not set in certain places in summer until almost 1½ hours later and in winter almost 1½ hours earlier than in more southerly points. At the same time, however, the angle of incidence of the sun's rays on the horizontal plane in various places becomes greater at all places in the South and attains to 10° more than in the North; and it exercises therefore a much stronger calorific influence. Therefore the longer continuance of heat of the long summer day in the North is made up for in the South by the greater intensity of the sun's rays and the continued clearness of the sky, and the difference in the summer temperature between the North and the South of Italy would tend to diminish, while in winter the greater length of the day as well as the greater intensity of the sun's rays combined produce a condition advantageous to the Southern portion, and the climatic differences in winter between the two portions of the country also caused by the sun in diverse latitudes will be more marked.

But to increase this meteorological diversity there comes in the special oro-hydographic configuration of the country. The sea which surrounds Italy, and which, except in the Northern portion, is distant a maximum of almost 100 km. from any inland point, tends to lessen these extreme differences, but in very diverse ways according to the direction of the prevailing winds, and the mountain ranges.

Thus the great Northern plain enclosed on three sides by mountains, as if it were a great amphitheatre, sloping down and open towards the little *Mar di Venezia*, does not profit as much by the tempering action of the sea, as the rest of that portion, whilst it is exposed almost without protection to the atmospheric influences from the interior of the Eastern European continent; its climate becomes necessarily «Continental.» *i. e.* extreme, with intense cold in winter, and great heat in summer, no more than one might expect from its greater distance from the equator. In fact, the temperature in Palermo in midsummer is 23.9° Centigrade; in Naples 23.2; at Venice 23.1°; at Milan 23°; whereas in winter it is 11.2° at Palermo; 8.8° at Naples; 3.7° at Venice; and 2.2° at Milan. To this must be added the other great climatological factor of rainfall. The magnificent bulwark of the Alps which encircles Italy at the North acts as a powerful condenser of the moisture of the atmosphere, carried by the prevailing winds from the Tyrrhenian Sea, whence the enormous downfall of rain and snow which the year round feeds the numerous affluents on the left bank of the Po, and the rivers flowing into the Gulf of Venice. The amount of rain reaches a maximum in Northern Lago Maggiore (Cannobio) yearly of 1,332 millimetres, and this is higher on the Carnio Alps (Gemona)

yearly 2,248 millimetres, where the currents of moisture from the Mediterranean spend themselves, either surmounting the minor obstacle of the depression in the Ligurian Apennines, or avoiding this obstacle traveling by way of the long channel of the Adriatic. In Peninsular Italy, on the contrary, the special distribution of the Apennines and of the prevailing aërial currents produce a diversity of favorable conditions in the various regions. The Apennines and the other mountains sloping towards the Tyrrhenian Sea are more frequently exposed to warm and damp currents deviating more or less from a S. W. direction, while on the Adriatic slope there is in winter exactly the opposite, and in summer a great variation of currents. Hence, in all the country situated on the Tyrrhenian Sea from the Ligurian Riviera to the Gulf of Salerno there is a more copious rainfall. The regions at the base of the Northern slope, on the contrary, have a smaller annual rainfall. Still smaller is the rainfall around the Plain of Foggia (Foggia, 422 mm.) and near the Gulf of Tarentum, and in almost all the islands.

To the vegetation, however, is no less important than the annual amount of rain, the manner in which it is distributed in the different seasons. In the Southern portion there are two months during the warm season in which there falls not a drop of rain. In the North rains are frequent even in summer, often in the form of noon-day thunder showers, which are destructive to the ripening fruit in the fields. (Summer average of rainfall: Palermo, 28 mm.; Naples, 55 mm.; Venice, 198 mm.; Milan, 236 mm. Winter average: Palermo, 292 mm.; Naples, 281 mm.; Venice, 123 mm.; Milan, 193 mm.).

From all this we may conclude that it is not very exact to speak of «the climate of Italy,» when there are so many different climates, according to the topography of the various regions.

Local conditions serve again to modify these distinctions, and are determined more especially by the formation, altitude, and position of the mountains and valleys with regard to the prevailing direction of the aërial currents.

But all these variations do not modify the influence of the latitude to such an extent as to prevent Italy, especially on the Tyrrhenian and in the Central and Southern latitudes, from being noted, in comparison with Europe, for an extraordinary mild climate, rendered still more agreeable by a larger number of cloudless days, and often made delightful by an enchanting splendor of the sky.

Animal and Plant Life.—In consequence of these conditions it is enough to refer to the characteristics of the Italian vegetation. The Italian flora is considered by botanists to be exceedingly varied, owing to the temperate climate, as well as to the variety of climates which are suitable to a greater number of botanical species. In addition to this, for a long period, man has voluntarily, and involuntarily, been increasing the species. Together with plants belonging to cold regions, there flourish in certain places plants belonging to warm countries. To mention only the best known species, in the South there are orange groves, hedges of agave and spunzie, and cotton, sugar cane, and date palms ripen there; but many of these and other more or less tropical plants may be found also in many places on all the Tyrrhenian slope as far as the North, where they even brighten the Ligurian landscape. Similarly, there grow, quite extensively in Italy, especially near the sea, evergreen trees and shrubs, which give a characteristic appearance to the winter landscape. But most important of all is the olive, which grows all over Central and Southern Italy as high up as 500-600 metres above sea-level, and in the islands as high up as 800 metres. The olive does not grow in the Venetian and Po plains, on account of the severity of the winters, but it may be found in places protected from the north wind and weather, as on the sunny slopes of the Lombardy and Venetian foothills of the Alps, and of the volcanic Colli Euganei. And together with the olive may be found other Southern vegetation. In the plain of the Po the summer climate makes remunerative the cultivation of not only vines and other fruit-bearing shrubs, and exotic plants, but also the cultivation of rice. In the whole of Italy, therefore, in the plains and on the less precipitous slopes are cultivated the different cereals, including maize in some regions, for instance, Abruzzo, and in some spots 800 metres above sea-level. And while, in Continental Italy, the vigorous winters suspend vegetation, in South Italy the groves of lemons and oranges and the pastures remain green, and many trees and shrubs are covered with leaves and flowers.

As for the animal kingdom, there are none that have characteristics worthy of mention in these brief geographical outlines. Many centuries of history and the great number of inhabitants have reduced to a minimum the species of animals that are not useful to man. Agriculture is carried on in favorable regions; grazing in summer on the mountains, and in winter, on the marine plains. Fishing is carried on extensively on the sea coasts, and cattle, swine, sheep, horses, silk-worms, are raised in more or less abundance. The species of fish found in the Tyrrhenian Sea are sardines and tunny-fish. There is also an industry in coral. The distribution of these various industries depends, of course, on the oro-hydrographic conditions.

Population.—The Italians form one people, and with very few exceptions, speak one national language. But they present an extraordinary number of variations in character and physical type, as well as in dialect, which is a natural consequence of the varied regional and climatic conditions of the country, and of the many thousand years of historical changes, invasions, conquests, intermingling and separation, and the various phases of civilization, out of which Italy of the present day has evolved. Before the Middle Ages, ancient history gives a record of the inhabitants of Italy as Iberi, Sicani, Siculi, Liguri, Veneti, Iapigi, Etruschi and the great family of the Italian people properly so-called: Umbri, Sabelli, Latini, Volsci, Oschi, and in the North the Galli, besides the Greek and Phœnician colonies of the South. Modern glottology finds traces of all these stocks in the division and differences of the present Italian dialects. Then came invasions and immigrations, small and large, of Germans, Arabs, Slavs, Spaniards, etc., at the beginning

of the Middle Ages, and during the subsequent centuries; and as a last relic of these, there are found at the present day, within the kingdom, some isolated patches of the Alps, and in the the Venetian foothills of the Alps, and in the high valleys of the Sesia and the Toce; franco-provencals in the Piedmontese Alps; Slav in the Julian Alps; Greek, Albanian, Slav, and others in Southern Italy, and the islands. But taken altogether these colonies do not amount to-day to more than about 200,000 souls in a population of nearly 34,000,000. Then again, this number is gradually decreasing with the multiplication of modern means of communication and with the increasing association between different districts. Further, the so-called «Compartimenti territoriali» (Piedmont, Liguria, Tuscany, Latium, etc.), between which we are accustomed at present to distinguish the Kingdom of Italy, and which are more directly referable to transmitted historical divisions, have their *raison d'etre* in a double order of facts, that is to say, in a combination marked with diversities inherent to the country, and in a condition of oro-hydrographic segregation more or less complete. Considered in their chief lines, it can be shown that they represent almost all not conventional divisions, but «geographical provinces.» And we must here seek one of the most cogent reasons for this political division, on account of which Italy fought for so many centuries. When once the military and political valor of the ancient Romans united Italy it was one of their chief and most laborious and wisest tasks to prevent the segregation of the various races by their network of celebrated roads. And even yet new Italy in its formation into a single State feels the imperious need of uniting and bringing into closer contact the various provinces of the kingdom by means of rapid communication by roads and railroads, and by the expenditure of a relatively large sum of money to do away with the natural inland barriers of the Apennines, by making roads across them at fully 15 points, with 15 different railroads, making furrows here and there through all the mountain system for long distances, also along its whole length, and enclosing the country as with a network of protection, with an immense circle of steel rails. Thus whilst the climatic and other geographical diversities remain unchanged, and give variety and a valuable stimulus to the various industries of Italy, modern civilization improves on nature by modifying the danger arising from segregation due to the natural formation of the geographical provinces, by promoting and cementing national unity.

Bibliography.—For a more profound study of the physical geography of Italy we recommend among others the following works: Marinelli, G., (The Earth); a popular treatise on universal geography (Milan). The fourth volume is entirely dedicated to Italy, part I, pp. 1-509, particularly to the Physical Geography. Fischer, T., 'The Italian Peninsula'; an essay on scientific chirography. First Italian translation revised and enlarged (Turin 1902, 1 vol., with map and illustrations). Both these works refer to others containing researches on special subjects.

GUISEPPE DALLA VEDOVA,

Professor of Geography in the Royal University of Rome; Academician of the «Lincei,» and other scientific societies, etc.

2. **Italy—Italian Archæology.** Italian archæology, from the remotest periods of human existence down to the Roman age, presents a series of successive phases enclosed by a vast horizon. The archæological material, which is uniform or nearly so, during the stone age, at the close of the latter, and at the beginning of the metal age, appears distinctly divided into regional groups, the people who produced it remaining in their own localities expressed their tendencies under varying influences and in different ways, as influenced by their local environment, without, however, losing the fundamental racial characteristics which testify to their common origin. During the following age of metal these differences increase as waves pile up and mix with waves. To the difference in implements is added the divergence of funeral rites. In northern and middle Italy, cremation and the placing of the remains in a mortuary vase, takes the place of sepulchre; in other regions cremation appears at isolated points, while in others it is absent; all this indicating not only intensified commercial currents, but also that there was a real movement of population. Caution is necessary in attributing differences of archæological material and of rites to immigrations of new people; these phenomena do not always coincide, sometimes they conflict with the spread of race and language. And this spread of race and language never coincides, either with each other or with the data of implements and rites. If for a given epoch we should color a map, using four different colors to show the districts in which are found similar material, analogous funeral rites, one race and one language, the four colors would not exactly cover one another. Nevertheless, if there were immigrations into Italy they occurred chiefly in the age of metal and the culmination of the movement was towards the end of the bronze age and at the beginning of the iron age. Two facts unite with the data supplied by implements and rites to prove that there was, in upper and middle Italy, an infiltration of peoples from the central regions of Europe. First, the presence in these parts of Italy of a different anthropological type with a rather large and round head, whereas in lower Italy the old Mediterranean type of the oblong, finely modeled cranium has remained almost unaltered. Second, the advance and then the predominance of the Aryan language whereas the ancient Mediterranean race which occupied Italy and its islands at the end of the stone age had a non-Aryan language.

From the beginning of the iron age the differences between the different regions of Italy remain practically stationary as far as the ancient indigenous civilizations are concerned; but they soon became intensified and simplified by two conquests or civilization movements which divided Italy between them. These two movements came from the eastern basin of the Mediterranean. From the insular and peninsular countries which afterwards constituted classic Greece, there came into Southern Italy and into Sicily small successive waves of peoples, at first not yet Aryanized as to language and perhaps driven out from their old habitations by new invasions (in these people we can recognize the Pelasgians of tradition); then, peoples who corresponded more and more to the conception which we have of the classic Greeks (a Mediterranean stock, Aryan-

ized in language). The pre-Hellenic proto-Hellenic, and Hellenic peoples colonized chiefly the coast and some stretches of contiguous territory. A parallel movement was the establishment of Phœnician settlements, which were, however, (except in a part of Sicily) covered up by the Grecian colonization, and are not of great importance as regards the Italian peninsula. The Phœnicians contented themselves with trading with the latter.

The other immigration, which divided Italy with the Greeks, was that of the Etruscans—a people of Mediterranean stock and of non-Aryan language. They came across the sea from Asia Minor and, finding the coasts of Southern Italy occupied as far as Cumæ, they crossed the Tiber and occupied the country to which they gave their name. From there, crossing the Apennines, they conquered the Æmilian plain as far as the Adriatic. Their influence branched out also into upper Italy, became extended to Latinni and over Rome, to the citizens of which the Etruscans were masters in the liberal arts and in religion, even giving them a king. Finally even the most southern Greek costal colonies felt their influence which asserted itself in the Campania of the interior by its systematizing work of changing old indigenous dwelling places into regular cities with religious and military organizations, which rose to great importance and to vigorous life (Capua, Nola, Pompeii).

The intensification of the pre-Hellenic and Hellenic commercial currents into real colonization movements took place on the old foundation of the same very ancient Mediterranean stock. The new comers were not far from their mother country in which the sons of their own progenitors continued to live and with which they liked to connect themselves, giving to their new home the name of Larger Greece Μεγάλη Ἑλλάς. Essentially traders and navigators, the Greeks did not give much care to the organization of territory. All these circumstances were extremely unfavorable to the establishment by them of an Italian nationality, hence the indigenous population of the south and of Sicily in part underwent a rather superficial assimilation which fell at the first blow and in part relapsed into barbarity and rapid decline.

Very different were the conditions in middle Italy when the Etruscans reached it. Before they, in their turn, conquered it the region inhabited by the old Mediterranean stock had already been conquered by the Umbri, who had an Aryan language and European civilization; and the prehistoric Umbria, which was considerably larger than the region which has preserved the name, then underwent a sort of mediævalism, of transformation and of revival. For their part the Etruscans did not have a home country near at hand where their brothers continued to live and with which they could keep up an intercourse. Their motherland was far distant and the connecting links were broken so completely that even to-day it is not possible, except very generally, to identify their original home. For that very reason the Etruscans were much better prepared than the Greeks to regard Italy as their real home, and to co-operate in developing a national spirit. But we should also mention the characteristics they show in the monuments which have come down to us. Profoundly religious, connoisseurs of art and excellent technicians, although not gifted with the sublime æsthetic sense toward which Greek art was tending, caring less for navigation and commerce than for organization of territory, the Etruscans got along better with the simple and rough Umbrians and conferred on them the dignity of a superior civilization, beginning with a true architecture, as shown in houses and tombs, and the organization of a city and public and military works, up to a religion pregnant with doctrinal and cosmological content. One fact which had a great influence in this connection was that the Etruscans, unique perhaps among the Mediterranean stocks in this respect, had preserved primitive and homely customs; they honored the hearth and gloried in the maternal name, mentioning it in epigraphs, whereas the Greeks had inherited from the «Myceneans» the separation of the two sexes and the very inferior position of women. By this conjunction of favorable circumstances notwithstanding the different language, the Etruscans very soon forgot, or made others forget that they were strangers; they amalgamated the indigenous elements and assisted in creating that Italic civilization with its sentiment of nationality, in opposition to the Greek; a sentiment which still existed among the Roman conservatives at the end of the Republic who regarded anything with a flavor of Greek as foreign and reprehensible. Without the Etruscans there would probably not have been a superior Italic civilization opposed to the Greek; there would have been only the contrast between a rudimentary and semi-barbaric civilization with one more advanced.

The Gallic dominion in the Cisalpine bounded the Etruscan power on the north and still further circumscribed it by descending into the Cispadana. There was without doubt a momentary return to a simpler and more primitive civilization in upper Italy, but it is not at all true that the Gauls did not manufacture their own pottery, metals, and other implements; their civilization has merely been less studied because it was ruder; but in certain points its centres of production can be established. For example it appears that Picinum (Pavia) was the centre of production for bronze buckles, which present a variation from the *La Tène* type.

But the Roman eagles were drawing near to the confines of Italy; they closed the vista opened up to us by Italian archæological material by restoring to uniformity the civilization of the peninsula and its products. Rome, the inheritor of the Etrusco-Italic national spirit, founded its power not so much on commerce and navigation as on the organization of territory, on the development of terrestrial communication, of public works and power, and of military and political ordinances. Under the powerful hand of the ruler the old population became uniform in civilization and language. The old name of Italy, born in the extreme south of the peninsula, set up for a moment as the standard of the national spirit in rebellion against the leading city, is taken up by Rome, is carried as far as the Alps and remains through the centuries as the symbol of national unity.

In the following outline, necessarily con-

densed, an attempt will be made to give a more detailed idea of Italian archæology in the present stage of the study.

I. Stone Age. *A. Archæolithic.*—Besides the localities mentioned in an article by Mortille (*Revue mens. de l'école d'anthrop. de Paris,* 1891) on the diffusion in Italy of axe heads of the type of Chelles, it appears that these objects have been found in other places also. Still more recently they have been seen on the island of Capri (*Bul. di paletn. ib.* 1906), where, as in the black earth (*Terra nera*) of Venosa, they are found with bones of animals of an extinct species and precede the great conflagrations caused by the volcanoes of the region. On the spread of the so-called Monster and Campigny types (see Colini, *ibid.* p. 203 *et seq.*) these stone implements had a large diffusion in Italy.

It is now certain that in the quarternian age dead bodies were placed in the caves of the *Balzi Rossi* (which although situated in Italy belong to the French sphere of influence), with rites which were still in use among the neolithites of western Liguria. (Consult Issel, in *Bullett. di paletnol. ib.* 1906, p. 102.)

B. Neolithic Period.—This age is characterized by stones which are polished and bored (hammers, axe-heads, studied principally by Colini) or finely retouched. Polished Italian axes are not usually of silican material, but the most ancient are of green rocks, later of various rocks. Green rock was for a time held to be exotic and a proof of the immigration of the neolithic people, but local strata of it are beginning to be found, and in any case such proofs of immigration do not hold good, because it is much more easy for the object itself to have traveled from tribe to tribe as among modern savages. Besides, this epoch has a beautiful and solid pottery made by hand and burned over an open flame as continued to be the case during the prehistoric age down to the introduction of the pottery oven and of the wheel which came with the Hellenic and Etruscan influence. But the neolithic Italian pottery is not only more beautiful and more solid in form, it is also more rich in ornamentation, which phenomenon is found also outside of Italy. A class of this pottery, indubitably neolithic, although the descendants of its authors afterwards possessed bronze, is better represented in Southern Italy, especially in the grotto of Pertosa, near Salerno. The neolithic period of Sicily, on the other hand, admirably represented by the deposit at Stentinello near Syracuse, is connected in form and ornamentation rather with occidental development and with the pottery of the *dolmens,* as Pigorini has already shown in connection with the famous bell cup of Villafrati. Megalithic monuments are especially known in Southern Italy and in the Italian islands.

The Italian neolithites lived in four ways: in grottoes; in fragile huts, the traces of which have been lost; in semi-subterranean huts (in which the part beneath the earth is found filled with human deposits, the so-called «hut remains»), and on pile structures. The arguments formerly advanced for distinguishing different peoples by the varying style of their dwelling places no longer hold good, in view of the facts; at times, however, a difference of age may be so distinguished. The dead were buried in caverns or in open ditches, mostly in a doubled-up position, sometimes on a bed of ochre from which the bones became colored, and which led to the belief in the practise of scarifying; this is no longer admitted to-day.

II. Metal Age. *C. Æneolithic.*—The population which occupied Italy and the islands during the neolithic age still remained when it began to possess and to cast objects of copper and then of bronze, or rather of an imperfect alloy as are the oldest ones. The rites and customs remained in substance the same, only becoming more developed. This has been amply demonstrated in the profoundly scholarly monograph of Colini 'Il Sepolcreto di Remedello e il periodo eneolitico in Italia.' It is noteworthy that in that epoch there were already sporadic cases of cremation, which shows how even primitive indigenous customs evolve and change without the intervention of new people. The singular position assumed by Sicily in this epoch is also worthy of note, with its typical small funeral grottoes cut in the rock, and its bichromic pottery painted with linear ornaments of savage taste.

D. Age of Bronze.—For this epoch also we have a scholarly monograph by Colini in Vol. V. of the 'Atti del Congresso Storico di Roma' (1904, p. 3, *et seq.,* reprinted with figures in the *Bull. di paletn. ib.* 1903 *et seq.*). With full understanding of his subject the learned author shows that all the regions of the Italian peninsula and the islands had their age of bronze with tools and with the evolution of a characteristic civilization, but which varied in different regions according to the different ethnical constitution of the inhabitants. In Sicily, as is shown by the splendid research work carried on and accurately described by Orsi, there is no doubt that the age of bronze was evolved without any intrusion of new ethnic elements, but by the superposition of related elements (Siculi), passing through the straits of Messina, upon the most ancient islanders of the same Mediterranean stock (Sicani), and it would have come about independently even without their aid. The Siculan age of bronze is particularly characterized by the multitude of funereal cells out of which lateral niches frequently open, by the introduction of certain architectonic principles, by weapons, instruments, and ornaments of bronze of a characteristic style, and by new commercial influences substituting «Mycenean» products for the pre-Mycenean which already appeared in the eneolithic period. Together with the facts of simple evolution, which would always have come about, there is a revolutionary one, that is, the sudden abandonment without decadence or decline of the singular bichromic eneolithic pottery and the brusque introduction of an achromic smooth pottery of an angular mould (imitation of metal), which almost instantly supplants the other. This fact, inexplicable by the simple theory of evolution, should be placed in connection with the historically certain event of the arrival of the Siculi in the island.

This opinion which the writer advanced (comp. 'L'Anthropologie,' 1897, p. 129 *et seq.*), and has held for some years, is in its turn con-

firmed by two facts: In Southern Italy the archæological stratum with the characteristic bichromic pottery of the Sicilian eneolithic period is lacking; also the neolithic pottery with decorations, of the type of Butmir and of Knossos evolves in the metal age into an achromic pottery of angular mould. The characteristics of this pottery are the high, broad handles with an opening. They are lacking in the Siculan eneolithic period, but are found in the Siculan age of bronze; and what is more important, in types which represent a typological or chronological continuation of those of the peninsula and which belong to a more recent strata also as regards certain chronology, and represent a stylization and geometrization, an exaggeration or an atrophization of the pure cave forms which persist in Southern Italy.

In this lower part of the peninsula, to judge from the studies of those who, like Orsi, know its material and that of the large neighboring island from personal observation, there can be no doubt that the ethnic basis is identical with that of Sicily, and that dwellings, graves, and implements are to be attributed to the same very old Siculan people who had occupied the peninsula from time immemorial. In Southern Italy, therefore, the connection with Sicily in civilization shows the influence of propinquity and not only the commercial one. The dwellings of Taranto, held to be analogous to the so-called *terremare* of Æmilia, in reality are not that, but are a Siculan village with houses or huts held up by piles planted in the ground, also surrounded in part by a stone wall continuation.

The neolithic period lasted tens of thousands of years; the tombs recently discovered belong to a very ancient age, and show primitive types. The dwellings, on the contrary, begin (as at Pertosa) in the recent neolithic period contemporary with those of Knossos and of Butmir, and end with the Mycenean period. The types of the vases of the dwellings of Taranto cannot be derived from those of the *terremare,* because they are older, as Brizio rightly observed.

Ascending the peninsula, there is found in middle Italy, especially in Latium and in Rome itself, at least from the end of the bronze age, as it were the meeting of two currents; on the one hand the partial persistence of the rite of sepulture and of similar types of implements, which are considerably more numerous than is generally believed; on the other the superposition of cremation and of certain new types or varieties.

In upper Italy, in which Æmilia may be included, we find cremation predominating. The theory according to which this rite was brought by a special invasion of pile dwellers of the age of bronze, is founded on an observation, on a hypothetical explanation of the same, and on a second hypothesis. The observation regards the difference between the material of the eastern or Venetian dwellers, and that of the westerners; the hypothetical explanation is that this difference was caused by the coming of a new people: the second hypothesis is that this new people began rapidly to descend the peninsula, preserving their customary living on pile structures, even on terra firma, far from the lakes, and becoming builders of the mound dwellings (*terremare*) of Æmilia. This theory has been opposed by Brizio in his 'Epoca preistorica,' and practically the distinction between the Western and Eastern pile dwellings was asserted without sufficient reason.

E. Age of Iron.—In Sicily the character of the preceding age remains with a few modifications, with the decadence of indigenous industries and with the increase of commercial influences in which the proto-Greek element takes the place of the Mycenean. The same thing takes place in Southern Italy of which the Campania has been studied in the last years more than other regions. Here, in two points, there have come to light new centres of prehistoric inhabitants who saw the dawn of Greek history and colonization, and also in their funeral rites as in their local industries, restricted chiefly to pottery, reveal the persistence of relations with the prehistoric caves, and with Sicily. The cemeteries of the valley of the Sarno are sufficiently enlightening in this respect, but much more important are the graves and the pre-Hellenic dwellings of Cumæ, which show us the origin of the Greek western colonies in a way very different from the conventional one, that of literary tradition and of pure history.

The rare and problematical traces of the Villanovian (Umbrian) civilization can point only to commerce. In middle Italy, especially in Latium, the traces of two ethnic elements still continue to be distinguishable, but in the end become confused with Etruscan influences and with those of Greek and Phœnician traders, and the whole is under way to that happy fusion which gave us Rome. Æmilia and pre-Etruscan Tuscany constituted the real sphere of Umbrian influence, whose largest centre was Bologna. For the classification of the Umbrian tombs of Bologna, for the traces of dwellings, and for the celebrated deposit of S. Francesco, consult, in addition to the works of Brizio, the work of Montelius, entitled 'La civilization primitive en Italie.' An important centre of antiquity with close affinities to that of Bologna is at Este.

The general type of all these tombs is an excavation (*Pozzo*) at the bottom of which are collected the ashes covered by a cinerary urn (*cistola*), protected still further by an enclosure of stone slabs, or by a wall of small stones which covers the excavation, in which is also the funeral outlay. Altogether this civilization differs and diverges widely from that of the south and of the islands; it is less Mediterranean and more European.

F. The Pelasgians.—There is no doubt that before the colonization movement of the classic Greeks, of Aryan language, there came, especially into the Italian peninsula, small waves of Oriental non-Aryan peoples; one of the last was that of the Messapi, who Herodotus makes come from Crete, and who have left us documents in an incomprehensible language, isolated from the other Italian dialects, and standing alone except for reminiscences of style, partly Mycenean, which they preserve in their implements. The last, strongest, and most surely Pelasgian was that of the Etruscans. The question as to whether the wall girdles, other-

wise called Cyclopean, should be referred to the Pelasgians and as to what materials and people correspond with them, has not yet been answered. The excavations of Norba, which were loudly heralded as a discomfiture of the Pelasgophiles and which concluded by attributing the walls to the Romans, have in reality decided nothing, not having succeeded in finding a single tomb belonging to the city. More conclusive were the excavations carried out by the writer in *Atena Lucana*, not so much because they succeeded in obtaining very positive results as because through them it was shown that the Romans could not have constructed the walls. The material found there of the historic age goes back at least to the 7th or 6th century before the vulgar era, and the prehistoric age is also represented; but the implements collected were few, poor, and left many gaps.

III. Historic Age. *G. The Etruscans.*—Etruscan archæology deserves a separate article, but it is fairly well known through manuals of history, art and civilization. Here we will only mention that the theory of their descent from the Alps and of their ethnic unity with the so-called Italicans, is no more admitted, now the derivation of the Etruscans from Asia is recognized, together with the non-Aryan character of their language. Brizio has the merit of having proved this, but the credit of having reopened the question and coordinated it with more recent research is due to Modestov. A great progress in Etruscan studies is represented by the *Musco topografico del' Etruria* founded at Florence by Milani and described by him in a special illustrated publication which has the same title as the institute. Milani is publishing a remarkable collection of the principal monuments in the archæological museum in Florence with good plates, with an attempt at a religious explanation. To the most ancient Umbrian pozzo tombs with the right of incineration are added the rich chamber tombs, with the rite of sepulture, with characteristic architecture, art, and a directly imported industry, which the Etruscans developed in their new home, whereas the indigenous population progressed in its turn, but gradually fell under the influence of its rulers. A too violent reaction against the ingenuous exaggeration of the old archæologists, who too easily attributed everything to the Etruscans, fell into the opposite extreme of despoiling them of almost everything to attribute it to the Ionian Greeks. But now there is a tendency to return to the old standpoint; the important studies of Karo (in 'Studi e Materiali') return to the Etruscans the glory of the fine filigree and lace goldsmith work; we may also mention the studies of the writer on the origin of the Italic house whose first real architecture, which derives nothing from the hut of the age of iron, as Nissen believed, it owes to the Etruscans.

The existence of Etruscans in the Campania was, a few years ago, denied by some archæologists, but the question was reopened by the writer, who attributed to them the production of the black ware (*bucchero*) which is peculiar to the interior of Campania in all the southern regions, and is met only in Etruria; there was also found in old Capua an Etruscan inscription on terra-cotta, and lastly in Pompeii an old column of Etruscan art, preceding the oldest houses of the city, which are of a non-Grecian character, and calcareous stone, and whose construction as well as the regular map of Pompeii are also attributed to Etruscan art.

H. The Greeks.—The Hellenic colonies of Sicily and Italy also deserve a special article, but they also are well known and are discussed in all manuals of ancient history, of art and of Greek civilization. The oldest colony appears to be Cumæ, which furnishes a geometric pottery more archaic than that of Sicily, and in the foundation of which city the part taken by Æolian Kyme is confirmed.

The Greeks, as has been seen, occupied a place already inhabited by an indigenous population, as was also the practise of the Etruscans, and they organized it into the form of a city. Cumæ has furnished precious archæological material, which is now mostly collected in the National Museum at Naples, and which is still largely unpublished.

For the Greek colonies of Sicily we have exhaustive works, due in large part to the activity of Orsi. After the volume of Cavallari and Holm on Syracuse, our knowledge of the necropoli of that city and of their material has been greatly augmented by the numerous researches of which Orsi has given an account in 'Notizie degli Scavi.' On Megara Hyblæa we have a very good and complete study by Cavallari and Orsi, and others by Orsi about Kamarina (in 'Monum dei Lincei'). But the other Sicilian colonies have been little studied; likewise the Italiote colonies, except now Taranto, which also was neglected for a long time. Among the most important monuments left by the Greeks of Italy and Sicily are without doubt the temples, for which consult the work of Koldewey and Puchstein, 'Die griechischen Tempel in Unteritalien und Sicilien.'

Peculiar to southern Italy is the abundant production of decorated pottery, born under the Greek influence, but developed in large part in Italic cities or according to local spirit. Consult the writer's monograph on 'Ceramica antica nell' Italia meridionale,' of which Mr. Walters has given a good summary in his 'History of Ancient Pottery.'

I. The Gauls.—The Gauls have been met with by the students of the Transpadana, of Venice, and of Æmilia and Picenum. But their implements, of which there are scanty remains, are not at all beautiful, and are very little studied. We will mention only the works of Bianchetti on the sepultures of Ornavasso, of Castelfranco, and of Brizio on various necropoli of Lombardy and of the provinces of Bologna and Ancona.

J. The Romans.—In unifying Italy, the Romans unified also its civilization and its products. The great artistic character of the monuments in which the Romans developed the national elements, inherited from the Etruscans, also taking up Greek elements, passed beyond the confines of Italy. These arts are above all architecture, historic and iconographic sculpture, mural and decorative painting (into which was transferred much of Greek and Hellenistic art), and mosaics, of a more specifically Alexandrine derivation, but to which,

nevertheless, Roman artificers knew how to give an individual development and character. In their archæological material we can distintinguish diversity of province and of fabric, but no longer different civilization and peoples.

A large part of our knowledge of the intimate life of the best Roman period is derived from Pompeii (q.v.), which, buried by an eruption of Vesuvius in 79 A.D. has preserved better than any other source the little implements of daily use, the circumstances surrounding their use and their application. A special article would be necessary to treat of Pompeii, but the place is so well known that a mere mention will be sufficient in this summary. A special importance attaches also to the topography and history of the city which was the great crucible in which were fused and from which were diffused all the elements which constituted Roman civilization. The most important of the finds recently made in the Forum are the pre-Romulean necropolis and the now celebrated stele with the inscription in which, after much hesitation and contradition, a *lex regia* is now generally recognized.

K. The archæology of Sardinia deserves a separate treat on account of its special character.

Traces of the palæolithic age have not yet been discovered in Sardinia. The neolithic period is connected with the civilization of the western basin of the Mediterranean, hence with the Sicilian and with that of the Italian peninsula; likewise the eneolithic period to which must be attributed the *domus de janas* analogous to the oven grottoes of Sicily. An excavation recently completed by Taramelli at Anghelu Ruju, near Alghero (consult *Notizie degli Scavi,* 1904), not only shows us much better than before that period of prehistoric Sardinian archæology, but proves to us that the Sardinian æneolithic period is superior to the Sicilian, as regards its greater antiquity, the more notable progress and richness of its local industries, and its development of funeral architecture. It proves besides that the beautiful pottery of chalcolithic Sardinia is very closely connected with that of the megalithic monuments of France and Spain, without having any relationship to that of Sicily, which with its singular and wild ornamentation in two colors always remains more isolated and stands out as a distinct ethnical individuality, taking the word in its historical rather than anthropological sense, because the race is the same. At the end of this epoch begins the civilization of the wall period (*nüraghes*) and of the «tombs of the giants,» so typical of Sardinia and lasting without doubt many centuries, to come to a close at the time of the most ancient Phœnician colonization of the island. The more recent researches confirmed the opinion that the numerous and imposing Sardinian walls (*nüraghes*) which are not tombs, are fortified houses, often erected to guard passages which of themselves would attest to a period of greatness and power.

The discovery at Haghia Triada in Crete of large bronze tablets like those found some time ago in Sardinia at Serra Ilixi (comp. *Bull. di paletn.* 1904), gives occasion to mention the good services of the Italian mission in Crete directed by Prof. Halbherr, to whom are due noteworthy discoveries and full illustrations of them.

A worthy but hasty synopsis is the work of Pinza, 'Monumenti primitivi della Sardegna,' the conclusions of which, like those of Mayr ('Die Vorgeschichtlichen Denkmäler von Sardinien,' in Globus, Vol. 86, n. 8, 1904), should be corrected in the light of more recent discoveries.

But Sardinian archæology does not assume an individual aspect merely during the prehistoric age; it stands apart from that of Italy, even in the most ancient phases of the historical period. The superior and more advanced civilization of the Orient, the literary culture, is not represented either by the Etruscans or the Greeks, but by the Phœnicians; who did not put foot on the Italian peninsula and managed to maintain themselves in opposition to the Greeks in a part of Sicily, although they certainly did not represent the preponderating element. The study of Sardinian Phœnician antiquity was neglected for a long time. In the year that the writer directed the excavations he carried on researches on the site of the city of Nora, completing the data gathered by others and gave the results of his studies in a monograph published in Vol. XIV. of the 'Monumenti dei Lincei.' In that he has tried to prove that the first colonization of Sardinia goes back to the eastern Phœnicians, and not to the Carthaginians, and, both by analyzing the connections with preceding, contemporary, and subsequent civilizations, and by studying the primitive elements of Semitic culture and religion, he hopes to have established the basis for a historical synopsis of the Sardinian antiquity on a higher plane than any yet attempted.

GIOVANNI PATRONI,
Professor of Archæology in the Royal University of Pavia.

3. Italy—History of the Middle Ages. In the Middle Ages Italy took the first rank in the history of civilization. The differences that arose under the Roman rule between the Greek Orient and the Latin Occident continued in the new historical period and included also the religious beliefs, terminating in schism.

During the greater part of the Middle Ages, Italy, the seat of the Papacy and of the Empire, was the centre of political life of the Western Empires, and in the 14th and 15th centuries became the centre of culture.

The Middle Ages are generally supposed to begin with the year 476, because from this time till the reign of Charlemagne no Western prince held the imperial power. Nevertheless, during these three centuries the Empire did not remain in the West. It was a unique institution even when, under Diocletian and his successors, it was represented by several associated princes. After 476 it was again represented in the Occident as a sovereign power by the resident prince at Constantinople, the legitimate heir of Romulus Augustulus, this unity manifesting itself above all in the uniformity of the laws and of the consulships, with their similar official designations of the year, as long as it lasted.

Odoacer assumed the title of king out of regard for the barbarian army of Italy, but ruled only as an imperial functionary. His residence

was at Ravenna, where he maintained the Roman form of administration with its complex organization, and its rigorous separation of the military from the civil functions. He ceded Provence to the Visigoths, conquered Dalmatia and Sicily, granted a third of the landed property of the Italians to the barbarian soldiery, where they took possession and settled, and thus through the application of the principles of hospitality there arose among those people the institution of private landed property.

Odoacer's reign was a short one. Zenone sent him against the Ostrogoths under Theodoric, who desired fresh conquests. Theodoric acted as an imperial functionary. He substituted his own rule for that of Odoacer, resided at Ravenna, ceded to his soldiers the third of the Italian lands wherever the army was stationed. Thus continued the imperial sovereignty in ideal and judicial order; for the Consulate continued, and as long as the Ostrogoth kings were in power, they published edicts and not laws, and an edict came within the limits of a magistrate's power, but they in reality ruled as independent sovereigns.

Theodoric endeavored to amalgamate the Goths and the Romans. He maintained, with slight alterations, the tributary and administrative system of the last years of the Empire, and in compiling the edicts, obligatory on both peoples, he established a common and general legislation. But this policy failed, especially by reason of the diverse religions of the two nations. His failure to accomplish these ends inspired him to violence against the Romans. He was more fortunate in his external policy, for he restrained the power of Clodovicus, reconquered Provence, and maintained a moral hegemony over some of the Germanic kingdoms.

He was succeeded by Atalaric under the regency of his mother, Amalasunta, who desired to govern in accord with the Emperor; but when Atalaric died the National party, opposed to the Romans, forced her to associate with her cousin, Theodatus, who had her assassinated, thus giving to Justinian an occasion to interfere in the affairs of Italy, and Belisarius, having conquered the Vandals, was commanded by the Emperor to march against Theodatus, thus beginning a war that lasted 20 years, during which the kings Vitiges, Totila and Teia, and the Byzantine generals, Belisarius and Narsete, were conspicuous by their valor. At length Italy passed under the direct jurisdiction of Justinian, who rehabilitated it by Pragmatic sanction. Provence was reconquered by the Franks.

The Greek domination in the whole peninsula lasted but a short time. In 568, or thereabout, the Lombards invaded Italy, followed by adventurers of various races, and they continued to extend their dominion, but could not conquer the whole peninsula. Italy lost its political unity and the Roman division of it into provinces. A Lombard Kingdom was formed. Italy in part was divided into Duchies, of which later on Pavia was the capital, and its cities, the residences of dukes and *gastaldii*, became the centres of the new administrative divisions. Italy continued to be in part a Byzantine province, governed by an exarch in Ravenna, and formed of scattered regions, almost all on the coast, which slowly reorganized as military circuits.

Meanwhile Gregory the Great gave to the Roman Church the priority over all the other churches of the Occident, and she thus rose in reality to be a universal institution. Gregory II. defied the decree of Leo the Isaurian against the worship of images, and although the dissension did not go beyond the limits of a religious controversy and the popes remained loyal to the Emperor, as they preferred his rule to that of the Lombards, the papacy became conscious of its power and under Zachary intermeddled in the nomination of the kings, consecrating the substitution of the dynasty of Pepin le Bref for that of the Merovingians.

The Lombard Kings of the most importance were Alboino, Autari, Agilulfo, and then through the means of Theodolind began the conversion of the nation to Catholicism:—Rotari, who published the Edict, a territorial law binding to both conqueror and conquered; Lintprando, Rachi, Astolfo, Desiderio. The latter two strove bitterly with the popes; Astolfo occupied the Exarchate and threatened Rome. Stephen appealed to Pepin who confiscated Astolfo's conquests and gave them to the Church. In this way the Pope arrogated to himself the domination in Rome, in the Exarchate, and in Pentapolis, in the name of the jurisdiction of Saint Peter. Desiderius quarreled with Adrian I. who appealed to Charlemagne. The latter conquered the Lombard kingdom except Beneventum, and renewed Pepin's donation to the Church. The Lombard kingdom, however, maintained its individuality, its union with the kingdom of the Franks being only personal and dynastic.

Charlemagne made many campaigns into Italy; and little by little, he substituted Frankish counts and marquises for the Lombard dukes, giving them authority to preside at the tribunals and in the administration, and to proclaim a conscription in time of war. He obliged the dukes of Beneventum to recognize his sovereignty, and in the year 799 obtained from Pope Leo III. the imperial crown, this dignity having lapsed in the Orient at the death of Constantine VI., and the Pope was only too anxious to assure to himself the protection of the ruler of what was now nearly the whole Occident. Thus the Catholic world had two universal institutions: one the Papacy; the other, the new Empire, consecrated by the Pope.

Under Charlemagne's weak successors the Carlovingian monarchy became divided into several kingdoms which were frequently at war between themselves. «Charles the Fat» re-united them, but in 887 he was deposed. The monarchy was then divided into five states, one of which was the feudal kingdom of Italy. With the weakening of the sovereign authority the local governments instituted by Charlemagne, were transformed into hereditary principalities. Thus arose the feudal aristocracy, the chief cause of the weakness of these monarchies. The feudal kingdom of Italy was continually disturbed by this proud and rebellious nobility, until through the instrumentality of Otto I., in 952, it became a fief of the German crown. During this time the imperial throne was often vacant.

Meanwhile the Duchy of Beneventum had been divided into the Lombard states of Beneventum, Salerno, and Capua. The Greeks,

through the machinations of the Arabs, lost Sicily, but reconquered a great part of Apulia; Naples, Gaeta, and Amalfi had become autonomous duchies under the suzerainty of Byzantium. Rome was in a state of anarchy through local factions. Lacking imperial aid the papacy lost political authority. The islands of Venice became autonomous states under the suzerainty of Byzantium. Towards the end of the 7th century they formed a duchy which at the beginning of the 9th century had its capital at Rialto, an island that thus imposed its preëminence on the rest, and later took the name of Venice.

Otto I. in the year 961 assumed the government of the Italian kingdom, and in 962, received the imperial crown at Rome. The Pope had need of protection against the adverse faction, and the king rose to the highest political supremacy. The coronation with the iron crown —a custom introduced by Berengarius I.—and the coronation as Emperor became from thenceforth essential, consequent and complement to the title of King of Germany; but the title to universal political supremacy came to the Emperor through the Pontifical consecration, and this stirred up bitter strife in future times.

The policy of the House of Saxony (Otto I., II., and III., and Henry II.) towards Italy was determined by three aims: to weaken the power of the feudal laity by placing it in opposition with the feudal ecclesiasticism; to establish the sovereignty over Rome by making the pontiff a vassal; to conquer Southern Italy. With the first was associated the granting of the rights of supremacy and administration to certain bishops; hence the temporal jurisdiction over cities, and its consequent restriction of the power of the count; which power was thus restricted to the county or state, and sometimes this episcopal jurisdiction extended to the whole county, and thus its limits coincided with those of the spiritual jurisdiction. As for Rome, its authority was uncertain, as it varied according to the power of the Emperor; and in Southern Italy the expeditions sent thither had been unsuccessful. The succession of Henry II. in Italy was contested vainly by Arduino, assisted by the feudal secular party.

The House of Franconia succeeded the House of Saxony, in the person of four princes, Conrad II., Henry III., IV., V. Conrad II. placed the minor feudal secular party in opposition to the feudal ecclesiastical party, granting to the former the right of heredity, and the inalienability of tenure, by this means strengthening the middle ranks and decreasing the power of the great feudal ecclesiastical and secular parties. During the minority of Henry IV. (through the efforts of Hildebrand) the Church began its emancipation from subjugation to the Empire, and rendered itself independent of the imperial power and of the civil factions, by entrusting the election of the Pope to the College of Cardinals.

When Hildebrand became Pope, Gregory VII. instituted a political theocracy and formulated the principle that the Pontificate held supremacy over the Empire, and consequently over all Catholic powers, spiritual and temporal; and as Henry IV. pursued the traditional policy of the Emperors, which was in direct contradiction to that of the Pope, there arose between the two institutions the most characteristic contest of the Middle Ages. Then it took form in the question of ecclesiastical investiture, for the Pope would not permit to the secular princes this concession. This contest lasted during the reigns of Henry IV. and Henry V., and came to an end at the concordat of Worms, which did not determine the chief question—which of the two powers was supreme—but only the accessory question of investiture, establishing exclusive right of the Pope to spiritual investiture, and that of the King to temporal investiture.

These dissensions were of utility to the Lombard cities. Owing to the comfortable, peaceful life they enjoyed because of the reconstruction of the walls, and the somewhat mild rule of the episcopal government, their population increased in the 10th and 11th centuries, and the middle ranks, whose party had been strengthened by Conrad II., formed new social classes, which resumed the profession of arms. During the contest for the rights of investiture the urban aristocracy, alone, or combined with the wealthier portion of the bourgeoisie, acquired the political rights of the local authorities. Thus arose a new civic order, the Commonalty, who attained the position of consuls and the *consilia*. But all this was done without the sanction of the sovereign, and therefore was not as yet a legitimate institution.

Meanwhile, in Southern Italy, in the 11th century, arose the Norman Principalities of Drengot and Altavilla. These, under Robert Guiscard and Ruggero, took Apulia and Calabria from Byzantium, Sicily from the Arabs, subjected Salerno and Beneventum, and in order to legitimize their conquests received investiture from the Church. Ruggero II. completed the conquests by the subjugation of all the other states of Southern Italy and of Abruzzi, and obliged the popes to recognize his royal title.

With the fall of the House of Franconia there arose in Germany a dynastic contest between the Guelphs (House of Bavaria) and the Ghibellines (House of Suabia) for the succession to the throne. Lothair of Saxony succeeded Henry V., then came Conrad of Franconia, then Frederic Barbarossa. These wished to recover their rights as kings of Italy and as Emperor; whence their contest with the Commonalty of Upper Italy who formed, in defense of their autonomic authority, the first Lombard League, and with Pope Alexander III.—for at that time, two popes having been elected by two parties in the College of Cardinals, King Frederic thought he had the right to suppress the schism and thus he reopened the question of supremacy between Pope and Emperor. He made peace with the Pope at Venice in 1177, but even then the only question settled was that of the legitimacy of Alexander. He came to an agreement with the Lombard League at Constance in 1183, and in this way the Emperor recognized the autonomous authority of the Commonalty with the reservation to the sovereign of the right of investiture of consuls, and the right of Appellate Jurisdiction. The Altavilla family being extinct, Henry, son of Barbarossa, obtained the throne of Sicily by law of descent; at the death of his father succeeded him, but died in 1197, leaving a son four years old, the future Frederic II.

In 1198 Innocent III. rose to the papacy and resumed the policy of Gregory VII. and marked the apogee of the theocracy. The Guelphs and Ghibellines fought for the succession in Germany; the former being victorious under Otto IV., assisted by the Pope. But the usual dissensions arose between Otto and Innocent; the Pope placing the king of Sicily, Frederic, in opposition to the Emperor. Frederic was victorious, and obtained the imperial crown from Honorius III.

The Commonalty, meanwhile, had become almost the chief political party in upper and Central Italy; the counts of Savoy, the marquises of Lunigiana and Montferrato and some other princes being the few that remained of the feudal party. The rights reserved to the sovereign by the Treaty of Constance were already denied; the Commonalty had become an independent republic. It extended its territory to the smaller neighboring communes—which it treated as subjects—to the rural communes and to the feudal proprietors of the country, obliging them to reside temporarily in the city.

There then arose in the Commonalty new factions with the ancient name of Guelphs and Ghibellines, but impelled by local interest. The conquered feudality and the increasing power of the lower orders took part in these discords, but neither side gained a definite victory. The economic condition being thus imperilled by the instability of the government and continual wars, the idea was formed of substituting for the consuls a governor, *potestas*, of the order of cavaliers, chosen from other cities, and foreign to the local factions. This was accomplished by degrees. At first by an unusual method—suspension of the consulate; then, in the first ten years of the 3d century, by stable and regular method.

The new provision proved inefficacious, because the new authorities lacked the material strength necessary to overcome the factions. Thus sometimes this governor was drawn into their discords; and the people formed in several cities a commune of their own, with a captain of the people at its head. Under similar conditions, a party requires unity of action and one ruler. There was at the head of this one a leader, of an illustrious house, who sometimes deserted his own class to defend that of the people. Thus, the factions became identified with their head, and the dissensions between the two parties became dissensions between rival houses. When the head of the triumphant faction, who might also be the mayor himself or the captain of the people, held an unlimited tenure of the urban authority, there should be a new government—the *signoria*, who represented a necessary consequence of the new political and social conditions of the Commune. They do not represent a special official but the sum of the political power of the government. The first *signoria* arose in the latter half of the 3d century, in the form of a provisional dictatorship bound to the interests of the faction; later on, they became more stable, for the people had lost the consciousness of their rights, and, by the introduction of a mercenary soldiery, the practice of arms; and also owing to the fact that the *signoria* promoted the interests of their own people.

Frederic II. ruled according to Barbarossa's methods, and consequently the dissensions with the papacy and the Communes led to the formation of a second Lombard League. The war was ended in 1250 through the death of the Emperor, and without any treaty. The Italian cities maintained their independence. The imperial power remained vacant until 1312, in which year it was resumed by Henry VII., but it had become a mere shadow of its former supremacy, an honorary position conferred on the King of Germany after his coronation at Rome. The papacy took from the last Suabian princes (Conrad and Manfred) the kingdom of Sicily in order to bestow it on Charles of Anjou, who was not successful in his contest with the empire; thus even the excellent mind of Boniface VIII. had not the power to re-establish the theocracy, now quite incompatible with the intellectual and moral development of the laity. By degrees in the political order the papacy was transformed into an elective principality, restricted to one portion of Italy.

After this period the history of mediæval Italy became the history of its particular states and should be studied separately in separate articles. Here the history is only treated of in the whole.

The popes, not feeling secure in Rome, moved the Holy See to Avignon. On the re-establishment of the pontifical authority by Albornoz into the Ecclesiastical State, they returned, but the Western schisms weakened their authority. At length they took direct and real possession of the Roman Commune—which became an administrative entity—and exercised an uncertain sovereignty in the other portion of the Pontifical States.

The Kingdom of Sicily, their fief, by the war of the Cicilian Vespers, was divided into two kingdoms: Sicily under the kings of Aragon, and Naples under the rule of the line of Anjou; then under the Durazzo; and lastly, under Alfonso of Aragon, who left Sardinia, Sicily and Aragon to his brother John; Naples to his natural son Ferdinand. Genoa, mistress of Corsica, destroyed the naval power of Pisa, and for its own commercial interests waged a bitter war against Venice; after this being weakened by internal discords she passed under the protectorate of Milan, or of France. Florence conquered Arezzo, Pistoia, and Pisa. In 1400 the Medici, without any title, or external mark of authority, became the arbiters of the Commune. In Tuscany the *signoria* insinuated themselves like a sporadic growth; and the Commune continued as before in Florence, Siena, and Lucca. Venice, mistress of the Adriatic through the domination of Istria and Dalmatia, extended her dominion into the Orient by the Fourth Crusade, and in the Occident her conquests included all Venetia and part of Lombardy. In upper Italy the «higher signoria» placed the «minor signoria» under subjection. The princely family of Visconti arose in Milan and conquered almost all Lombardy, and for a time other regions, and in 1395 obtained the title of dukes. When the Visconti family was extinct, Milan was ruled by the Republic Ambrosiana; then she again became a dukedom under the Sforzas. The House of Savoy extended its dominion in Italy as far as the Sesia, and under Amedeus

VIII., in 1416, rose to the ducal dignity. All these states, although prosperous in respect to political economy and culture, were weak on account of the grave defects of their military and political institutions, which finally brought their decadence in modern times.

4. Italy—The Renaissance (14th to 16th Centuries).—*Historical Introduction.* Chronologically considered Italian history from 1300 to 1599 may be divided into the Age of the Despots, the Age of Invasions, and the Spanish-Austrian Ascendency, and the beginning of the 14th century witnessed the bitter struggle between Guelfic democracy and faithfulness to the Pope arrayed against Ghibelline aristocracy and loyalty to the Emperor. Every Italian city, every hamlet, felt the strife. Every city was divided against itself and there could be no tranquillity until one half of the citizens had driven the other half into exile, while from these battlements floated the banners of the partisans of the Empire and from those the banners of the partisans of the Church. Soon the captains on each side, men of noble families experienced in war, took the lead in the struggle and finally became masters of the cities. The Estensi made themselves lords of Ferrara, the Torriani masters of Milan, the Della Scala dynasty arose in Verona and the Malatestas at Rimini. In Tuscany the strongly entrenched Guelf party long held the nobles in check, and for a time the Communes remained free from hereditary masters. But wherever they obtained a foothold these tyrants annihilated both parties for the sake of peace and their own advantage. The tyrant won favor by levelling down the classes and favoring the multitude. Italians tiring of the fury of these civil wars gradually settled down and turned to home comforts, arts and literature, content to pay foreign mercenaries and adventurers to do their fighting for them. These mercenary troops hired out to the highest bidder and sometimes fought alternately against and in defence of the same city. After 1350 these foreign mercenary soldiers were supplanted by the Italian mercenary, and Alberico da Barbiano, a nobleman of Romagna, formed the first exclusively Italian company. Henceforth Italian battles were fought by Italian paid troops under Italian generals (Condottieri). But these soldiers were not patriotic; they sold their swords for money and fought for the highest bidder. Naturally they were not anxious to die or even to kill in a cause in which they had no interest, and battles became almost bloodless and diplomacy and skill were the requisites of victory rather than courage. Intrigue and treachery were rife and military vigor ceased to exist in Italy.

Between 1305 and 1447 approximated self-government and five great powers were established in the Peninsula: The Papacy, the republics of Venice and Florence, the Duchy of Milan and the Kingdom of Naples. In southern Italy Joan, the childless wife of four husbands, succeeded her grandfather in the kingdom in 1343 and was murdered in 1382 by Charles of Durazzo—who reigned five years. He was followed by his son Ladislas in 1387 and by his daughter Joan II. in 1414, and in 1435 Alfonzo (called the magnanimous) combined for the first time since 1282 the crowns of Sicily and Naples. The 23 years of Alfonzo's reign were the most splendid in South Italian history. The greatness of the Visconti family, Dukes of Milan, date from John, archbishop and lord of Milan, who died in 1354, and after a succession of incompetent and assassinated aspirants for the throne in 1378 Gian Galeozzo, his son, became duke and the most powerful and richest of the Italian despots, who pushed his dominion to the verge of Venice, subjugated Lombardy and attacked Tuscany, when suddenly he was cut short by the plague in 1402.

After the expulsion of the Duke of Athens in 1343 and the great plague of 1348 the common people of Florence rose against the merchant princes, and the necessities of war and of state soon placed Florence in the power of an oligarchy, headed by the great Albizzi family; Pisa was enslaved and Florence gained access to the sea. But the Medici gradually gathered strength and in 1433 came to open strife with the Albizzi and finally won.

When the popes settled in Avignon they lost their position as Italian rulers, but when Gregory XI. returned to Rome and when Urban VI., elected 1378, put an end to the exile, the popes again became Italian sovereigns.

Martin V. (1417-1431) and Eugenius IV. (1431-1447) resided principally in Florence, but Nicholas V. before his death in 1455 had firmly established the papacy in its temporal power.

Through the Middle Ages it had been the policy of Venice to refrain from conquest on the Italian mainland, and the first important entrance of Venice into Italian affairs was when in 1336 the republics of Florence and Venice formed an alliance against Mastino della Scala; and from 1352 to 1381 Venice and Genoa contested the supremacy of the Mediterranean, when Venice finally, though after many reverses, was victorious. In 1406 they added Verona, Vicenza and Padua to their possessions, and during the long Dogeship of Francesco Foscari (1423-1457) attained the height of its prosperity.

The year 1492 when Lorenzo Medici died, opened for Italy the age of invasions. Soon Spanish, German and French armies hastened to occupy her territory. Each petty Italian potentate strove for his own private advantage and there was no united resistance to the

invaders. Though Rome and Florence rejoiced, the election of Leo X. as Pope in 1513 brought no repose to Italy, and in 1527 occurred the famous sack of Rome by German and Spanish soldiers. But there was a great Emperor Charles V., and he in 1529 entered Italy and received the Imperial crown in Bologna and achieved the conquest of the entire peninsula, and from 1530 to 1796 Italy ceased to have a history of her own. THE EDITOR.

THE ITALIAN RENAISSANCE.

To the most genial of the great events recorded by history since the age of Augustus, was given the expressive name of Renaissance. Born of a profound intellectual movement, which aroused throughout almost all Europe a love for and research into classical antiquity, the Renaissance rendered human thought active and paved the way for modern civilization and culture. Except in the Middle Ages the study of the Classicists had never been less intellectually understood than at the beginning of this period. Religion, art and literature were all in a state of transition. Gradually Europe shook off the night of the dark ages and rebelled against their gloom. It was a beneficent movement, though sometimes in drinking deep draughts from these cups of classic learning, of pleasure and of freedom from superstition and ignorance, these drinkers became inebriated with the strong wine. The long duration of this transition constituted the Age of Renaissance, the 14th, 15th and 16th centuries—an age which, according to the common acceptation, was no longer mediæval, and not yet modern. It had its own peculiar characteristics, resembling in some respects the later Alexandrine Era; and in others, the splendid Age of Pericles; and it was distinguished by a marvelous activity in the world of letters and art, and in the development of universal genius and of heroic women, or *viragines,* as they were called.

Famous names are exceptionally numerous, and the importance of each increases the difficulty of making a choice and causes confusion in summing up results.

Add to this the preëminently individualistic character of the Renaissance, due to its origin; the intricacies of greater and lesser warlike undertakings, tumults of the people, the bloody greed of the princely families, the rebellions of the popes, religious discords and contests, and one may form some idea of the obstacles overcome.

The causes which impelled these seekers to look to the past for the motives and the means of progress were many, and diverse. The defects of actual civilization were apparent and the natural evolution of ideas revealed to human reason a new point of view from which to contemplate the varied phenomena of the visible and of the invisible world. As the 13th century drew near, the imminence of antiquity made itself more constantly felt. This revival began by lifting the veil from the human form. Niccolo Pisano, in a very decided manner through sculpture; the author, whoever he may be, of the 'Carmina Burana'; Cerminate, Albertino, Uzzato, and other literary contemporaries of Allighieri (1263-1321) carried forward the movement; as did also the masters who inspired Dante and Petrarch. A debt is also due to the rhetoricians and scientists of Byzantium and to the Hellenists of Sicily and Calabria, whence came Barlaam who gave the initiative to Petrarch and Boccaccio in the study of Greek.

We now come to Dante. The political and religious ideals of Dante Allighieri are almost identical with those of Petrarch. The art which the most celebrated poet displayed ('Purgatorio XII') belongs to another age, and possibly he got his inspiration from the columns of Rome and the sarcophagi of Pisa and Florence. No one observed and felt nature more than he did, and what he said about it came with the meaning of oracular thought; he loved fame, sought solitude, individualized himself; virtue and attributes which, combined, distinguished the man of the Renaissance from the man of the Middle Ages. Besides Beatrice, Allighieri had as a guide, Virgil, and, occasionally, Statius; Guido Cavalcanti was his friend whose doubts or convictions he shared in the nights when, wandering through the dense forests, he had not yet left the course from which none ever come out alive. Separated from the pleasing and cold severity of the schools, Dante belonged to the Renaissance. But with him it has not the graceful coloring, almost like the breath of dawn, which already began to tinge all literature—the culture of the human race. This was made evident for the first time in the life and in the works of Petrarch, the father of Humanism, who sang the praises of Laura. From the appearing of Petrarch, or, to fix the date more definitely, from his sojourn in Rome in the year 1337 until the time of Queen Elizabeth (1558-1603), Humanism and Renaissance are more or less synonymous. Some of those who followed the movement were realists; but since the philologist has prepared, or prepares the way by which we penetrate into the treasures of antiquity, and become acquainted with its principal actors and rulers, he is a Humanist by autonomy.

The intellectual culture of the newly awakened civilization began after Petrarch had abandoned his scholastic methods of reasoning and the Dantesque scourge had slipped its leash and made use of ridicule to demolish scholastics, astrologers, physicians, and other charlatans, and placed the ignored Plato above the dominant Aristotle. And it did not stop here; Florence, Arezzo, Bologna, Ferrara, Venice, became also the seats of the Renaissance. At Naples, the king of preachers, converted by Petrarch; in Milan, the Archbishop Giovanni Visconti, his host; in Piacenza, Mantua, Padua, Verona, the Da Correggio, the Gouzaga, the Da Carrara, the Della Scala, friends of Petrarch; in Avignon, popes not indifferent to the new philosophy, his generous admirers, formed the first nucleus of that company of «Marcenases» of the Renaissance, numerous even in the 14th century, innumerable in the succeeding century.

Already the movement was becoming ever more intensified; little by little the faint voice of the Classicists was revealed, and the ruins

uttered their voice, and the treasures were brought forth from the cloisters and the church. At the end almost of the 1st century of Humanism (about 1414), those persons who were only moderately cultured were already animated by the spirit of the new age, and classical culture had become an indispensable requisite to all who loved civilized society.

In the middle of the 14th century all minds were so well disposed that the design of Cola di Rienzi, so nobly conceived, seemed feasible. In Italy, Humanism had from the beginning patriotic characteristics. It is worthy of note that precisely in the 14th century there arose in Sicily a Latin faction in opposition to a foreign faction—the Catalana; Alberigo da Barbiano with an Italian character in a company of adventurers till then foreigners. The whole of Italy, either by money or by peaceful and unopposed usurpation, acquired political independence. Humanism, meanwhile, invaded the pontifical domain; first in Avignon, with the friends of Petrarch—Zanobi da Strada and Francesco Bruni; thence (when the schism was almost at an end), in Rome, where it soon mastered the papal secretary. In Florence and Bologna, with the Visconti and the Estensi, and all through the too numerous states of the Peninsula, convents, bishoprics and universities with more or less caution opened their gates to Humanism. At the time of the Council of Constance (1414-18) the Renaissance received another impulse from the many and happy discoveries of Poggio, and subsequently from those of other unwearying researchers of the Codici. They filled up deplorable gaps and improved our knowledge of classical civilization. The Humanists of the recent school diffused the knowledge of Greek civilization from the rostrum, searched for, guarded and preserved Greek *Codici;* excavations and travel enriched with inscriptions and the results of precious labor the museums which were then being established. Ciriaco Anconitano and Aurispa da Noto made themselves famous; the former by his collection of inscriptions, and the latter by his researches for Codici; while Flavio Biondo, of Forli, with Poggio, the Florentine, restored archæology. Then for the second time the favor of princes and republics, of universities, cardinals, magnates was sought in order to obtain the rarest antiquities, the best *Codici.*

In 1447 Humanism issued triumphant, amid universal plaudits and rejoicing, in the very chair of St. Peter (Tommaso Parentuccelli Nicolaus V.). In 1458, the poet, whom an emperor had crowned with laurel, assumed the name of Pius II. (Enea Silvio Piccolomini). In the 15th century it had, besides the popes, the splendid protection of Alfonso the Magnanimous, of the Estensi, the Sforza, the Malatesti, the Gouzaga, and the Montefeltro; but at the head of them all stood Cosimo di Medici, and Lorenzo di Medici the Magnificent, who were the most sincere lovers of Humanism.

At the very time that the students of moral science approached the thought of the classicists, the artists demanded of antiquity the secret by which they might produce artificially the fascination which the beauty of nature exercises over the human mind. Although their attempts were not always successful they arrived at the first transformation of mediæval art, which is distinguished by the glorious names of Donatello, Squarcione, Leon Battista Alberti. All the artistic manifestations of human sentiment became modified, from the greatest to the least. There is the Humanistic literature and the literature of the Renaissance. At this time, Humanism had reached its apex. Humanism brought discord into the camp of the Latinists. All minds were partisans of Plato or Aristotle. At Padua, Averroism began to revive. The Middle Ages also seemed about to revive. The orators became rhetoricians; writers sometimes became awkward imitators; canvases and walls became peopled with fauns; and the philosophers in reviving the forms of ceremonies no longer understood made themselves an object of ridicule to the Humanists themselves. The reaction came, and even before Savonarola planned his Catholic reform other men in the Church had set out to fight the spirit of the Renaissance, which now entrenched on the very foundations of the religion of which they were the ministers. At the same time sincere Humanists reacted not so much against the Boccaccio sincerity as against the obscurity which never was, and never can be the lot of any art.

The need was felt of new fields outside of the trodden paths. The broad philosophy of the Florentine Academy in reconciling classicism and Christianity, was one of the most characteristic examples of this moral necessity. Other philologers began to explore the Semitic literature; they studied Hebrew and Arabic. Contemporaneously, the Italian language, at once the child and the means of civilization, became reinvigorated, and resumed the position that the ages had awarded it. Finally, Pico della Mirandola formulated the new Norm (programme) affirming the rights of science, and the necessity of learning to know man in all the manifestations of his thought—the thought of the schools, which Humanism had overthrown. On this point the action of the revival was logical and complete; eclectic modern thought was born; a new era commenced. We are at the discovery of a new world.

Undoubtedly classical thought injured the religious fabric of Christianity in the minds of cultured people; but the new thought did not renounce the virtue of Christian morality. It is strange that the fact has not been taken into account that in Italy the only persons who were interested in Grace and Justification were those very Humanists of the 16th century, and the legitimate descendants of the Humanists of the 15th century. And in the very centres of the first period of Humanism those philologers who apparently enjoyed gossip and pleasure were troubled by the same doubts as ourselves, which like great breakers break here and there, from pole to pole. The two or three Obediences; the disposition, the arrest and the condemnation of a fugitive Pope; the long contest between the Council and the Pope, while they attacked the ecclesiastical question and forced the potentates of the Catholic world to support and remodel, they placed the thinkers of the day in the identical conditions in which modern thinkers are placed by victorious sci-

ence. That is why the Humanists faced the same questions which to-day preoccupy mankind. In their writings breathes the modern thought, and the Renaissance has for half a century attracted the special attention of students who, when they have collected all that has been published regarding that period, will have a rich and precious library.

The action of Humanism was beneficial in other ways. Many ills for which it is held responsible were the effect of very remote causes; and the Renaissance, in which Humanism played so large a part, is one of the glorious victories of civilization. To the lasting conquests that the present age owes to the age of the Renaissance, must be added another, which is that science at that period entered the path which has led it to the wonderful discoveries of our times. The study of anatomy first obtained a secure footing in the school of Bologna. In Florence, Toscanelli paved the way for the triumph of Christopher Columbus in the very year that the Portuguese discovered the African coast. Navigation became a science, opened the unexplored ocean, and Europe became the watch-tower of the civilization of the world. Meanwhile, independently of Humanism, but always in this 15th century of its activity, printing began to diffuse knowledge and to become the most efficacious means of promoting the brotherhood of humanity! See RENAISSANCE.

Professor of Modern History, Royal University of Bologna.

5. Italy — Modern History (1492-1815). *Foreign Intervention* (1492-1530).—The great Italian historian, Francesco Guicciardini (1483-1540), begins the history of his time by declaring that Italy was never so prosperous as towards 1492. Certainly the economic and intellectual condition of the Italian people was then far superior to that of the rest of Europe; but they became weak from lack of unity. Whilst France and Spain organized powerful kingdoms, Italy remained divided into a number of States; none of which was strong enough to unite to itself the scattered portions of the peninsula, though each was sufficiently strong to hinder another from carrying out the great work of unification. Italian policy at that time consisted in a continued series of combinations to maintain a kind of equilibrium, always difficult and unstable, between the five large States of the peninsula, Milan, Venetia, Florence, Rome, and Naples.

The Lord of Florence, «Lorenzo the Magnificent,» specially distinguished himself among his contemporaries by the great tact with which he prevented the breaking out of discords among various Italian princes; but he died in 1492 and at his death the political equilibrium was suddenly disturbed.

The first dissensions arose between the court of Milan and that of Naples. Then the young king of France, Charles VIII., who as heir of the House of Anjou—the eternal rival of the House of Arragon in Naples—had a right to the Neapolitan crown, descended on Italy to conquer it (1494). He crossed the peninsula without meeting any opposition, except at Florence, where Pier Capponi with his energetic words of defiance induced the French king to modify his demands. The Arragonese in Naples did not know how to organize a serious resistance; and on 22 Feb. 1495, Charles VIII., without opposition, made his solemn entry into Naples. The extraordinary ease with which he accomplished this conquest alarmed the Italian princes. The Duke of Milan, Ludovico Sforza, called the Moor, who had invited Charles VIII. to this undertaking, now began to organize a league against the French, which was joined by the republic of Venice; by Pope Alexander VI. (Borgia); by the King of Spain, Ferdinand II., Lord of Sicily and Sardinia; and by the Emperor Maximilian. Thus for the ancient Italian equilibrium they began to substitute the idea of European equilibrium. At Fornovo on the Taro, on 6 July 1495, a furious battle was fought which cost the French army many lives, and the allies boasted a victory. Charles VIII., however, succeeded in escaping and returning to France. But the few troops left by him in Naples were speedily driven out, and the Arragonese dynasty was once again established on the throne.

Whilst Charles VIII. was marching into Italy, the rule of the Medici had been overthrown in Florence, and that city reorganized its old republican form of government. A Dominican Friar, Girolamo Savonarola (q.v.), of Ferrara, at that time exercised a great influence over the people of Florence. But he aroused terrible enmity when in his holy enthusiasm he endeavored to improve Christian Society, inveighed against the scandals that the Court of Rome, represented at that time by the Borgias, furnished the world.

The Pope ex-communicated him, and the discords in Florence furnished him a pretext for getting rid of the friar. On 23 May 1498, on the Piazza della Signoria, in Florence, Girolamo Savonarola, and two of his devoted followers were hanged, and their bodies burned.

A new expedition to Italy was meanwhile preparing in France. The new king, Louis XII., being descended from Valentina Visconti, claimed his right to the dukedom of Milan, and to make his conquest more sure, he entered into an alliance with the Venetians, promising them a portion of his territory. Ludovico Sforza, the Moor, betrayed by his Swiss mercenaries, was made prisoner at Nevara, 10 April 1500, and taken to a castle in France where he remained until his death.

Once Master of Milan, Louis XII. considered the conquest of Naples, and to ensure success he made pact with Ferdinand, King of Spain, that they should together attack Naples, and divide the territory between them. The conquest was easy (1501); but in the division of land there arose disputes between the victorious monarchs. During the war which followed, there occurred the celebrated tournament combat between 13 Italians and 13 Frenchmen, in which the palm of valor was awarded to the Italians. The war terminated in a sudden rout of the French on the banks of the Garigliano, 28 Dec. 1503. The Spaniards remained masters of all of Napoletano.

Whilst the two principal regions of Italy, Lombardy and Napoletano, thus passed under foreign domination, in central Italy the family

of the Borgias attempted to establish a court and sovereignty.

One of the sons of the Pope, Cæsar Borgia, called Duke Valentino, of the dukedom of Valentinois, which was ceded to him by the King of France, undertook to overthrow the ruling families in the cities of Romagna and the Marches. By most cruel and dishonorable methods he captured Imola, Forli, Cesena, Pesaro, Rimini, and Faenza. As his captains had rebelled he pretended to accept their claims, but when he had them in his power, condemned all to die. But on 18 Aug. 1503, after a few days illness, Pope Alexander VI. died. The Duke Valentino then became ill. This determined the dissolution of his State. Many of the subjected cities recalled their former rulers; others were occupied by Venetians. The new Pope, Julius II., obliged him to restore to the Church the few remaining fortresses. Cæsar Borgia left Rome, and died a few years later while fighting with Spain.

Pope Julius II. initiated a very warlike policy. In order to retake from the Venetians the lands in Romagna which they were occupying, he formed a powerful league, which was called the League of Cambrai, from the French city, where it was signed. In this participated the Pope, the kings of France and Spain, and the Emperor of Germany. They all united against Venice. Thus, the old republic of S. Marco, which just at this time was beginning to find a formidable rival in its commerce with the Orient in the Portuguese, the discoverers of the new maritime route to the Indies, saw itself menaced also on the mainland by the principal powers of Europe.

In the spring of 1509, the French, after conquering the Venetians at Agnadello, captured Bergamo, Brescia, Crema, and Peschiera. The pontifical troops seized the territory of Romagna. The Spaniards took from Venice the ports of Apulia, and the Emperor Maximilian, descending the Alps, advanced to Padua; but his repeated assaults on the city were valiantly repulsed, and he was finally obliged to return to Germany. But the salvation of Venice was due to the ability of its diplomats rather than to the arms of its generals. The former detached the Pope from his alliance with the League which he had organized. Julius II., interested in preventing the extension of the French power in Italy, made peace with Venice (1510) and invited Alfonso of Este, Lord of Ferrara, to follow his example; and because he would not obey he invaded his territory. But the French hastened to aid the Duke of Ferrara, and then the Pope, carried away by the idea of succeeding in freeing Italy from foreigners, organized against France a league with Venice and Spain, an alliance which was called the «Holy League,» and was inaugurated with the battle cry of, «Away with the barbarians.»

At first victory smiled on the French, chiefly due to their young and valiant general, Gaston de Foix. But after the Battle of Ravenna, which was won by the French, and in which Gaston de Foix was killed (1512), the allies regained the advantage and were then joined by the Emperor, who had been the ally of the French. In a few months the «League» succeeded in driving almost all the French from Italy.

The allies met in council at Mantua and assigned the Dukedom of Milan to Maximilian Sforza, son of Ludovico, the Moor, and sent an army to restore in Florence the rule of the Medici, in order to punish the republican government of Florence for having shown itself favorable to the French.

The most prominent member of the Medici family at that time, was Cardinal Giovanni, who on the death of Julius II. (1513) became Pope, and assumed the name of Leo X. According to the traditions of his family, he protected men of letters and artists, so that this period of marvellous development of Italian genius is called after him.

Meanwhile wars continued. The French could not reconcile themselves to the loss of Milan; but the attempt of Louis XII. to reconquer it proved disastrous. His successor, Francis I., on the contrary, at the battle of Marignano (13-14 Sept. 1515) succeeded in capturing it.

He desired to make France the first European power; but the young Charles V., who was descended from Ferdinand, King of Spain, became a formidable rival. The army of Charles regained Milan from the French and placed in power Francesco II. Sforza, last son of Ludovico, the Moor (1521). The French vainly attempted to reconquer Lombardy. In the battle of Pavia (24 Feb. 1525) Francis I. was taken prisoner. In order to regain his liberty he agreed to hard conditions of peace, but hardly had he touched French soil than he broke faith and entered into an alliance with Venice, Florence, and with the new Pope, Clement VII., who also belonged to the house of Medici. During the war which ensued, 12,000 Germans, followers of the doctrine of Luther, descended on Italy, captured and pillaged Rome (1527). On hearing the news Florence overthrew the rule of the Medici, and proclaimed anew the republic. Finally, the tide of war turned in favor of the Emperor, more especially after the great Genoese Admiral, Andrea Doria, went over into his service. The Pope and Francis I. made terms with him; and then the other allied forces had to submit to the conditions imposed by the victors. Charles V. went to Bologna, where he was solemnly crowned Emperor, 24 Feb. 1530. In the diplomatic Congress called together, it was determined to allow Francesco II. Sforza to retain the duchy of Milan on condition that at his death it should pass into possession of Spain. Florence was to reinstate the Medici, as Charles V. had promised the Pope. Already, at the end of the Autumn of 1529 a Spanish Army had come, to lay siege to Florence, which, however, showed itself prepared to defend its liberty to the last. All the citizens, without regard to age, flew to battle on its walls. But this heroic resistance was in vain, owing to the treachery of Malatesta Baglioni, to whom Florence had entrusted the command of her troops. The decisive battle of Gavinana, near Pistoia, was fought 3 Aug. 1530, at which time was slain the Florentine, Francesco Ferrucci. A few days later, Florence surrendered to the imperial army, who ceded the rule to the Medici family.

Spanish Predominance (1530-1700).—In the midst of the wars which, during the first 30 years of the 16th century convulsed Italy and

ruined it economically, its political conditions also greatly changed. Of the five leading states, the Napoletano (Naples) had become a vice-royalty of Spain; Lombardy was occupied by the military forces of Charles V., the other two states—Rome and Florence—had lost almost all their political importance and were obliged to bow to the Spanish rule; and Venice, although proudly maintaining her independence, was no longer in a position to hold her own against the great powers of Europe.

France made another attempt to oppose the predominant power of Charles V. in Europe, and renewed the war on several occasions. Piedmont was the chief sufferer. The Duke of Savoy, Charles III., who had desired to remain neutral, ended by losing almost all his territory. Fortunately his son Emanuele Filiberto, who had entered the service of Spain, gained (10 Aug. 1557) the great victory of St. Quentin, in Flanders, and decided at the conclusion of the war to revisit his own state. Peace was concluded in 1559 at Cateau Cambresis. By the terms of this peace France was to restore almost all the territory occupied by her during the war, and thus the long rivalry between the two powers was definitely settled in favor of Spain.

The Spanish Domination soon enervated the minds and corrupted the customs of the people; and they became an enfeebled race, weak, enervated, without enthusiasm, and without ideals; and to make it worse, religious intolerance prevailed, which induced the Italians to mask their incredulity by hypocrisy.

The richest and most fertile provinces, Milan, Naples, Sicily and Sardinia, were subject to Spain, and the rest of the peninsula felt the reflex action of this subjection. Thus, the popes were on friendly terms with the Spaniards, because the latter had supported their ecclesiastical policy, and this friendship was soon changed into servility. The Medici were favorably disposed towards Spain in order that they might be let alone; the republic of Genoa from the time of Andrea Doria was an ally; or rather a servant of Spain; and the dukedoms of Ferrara, Mantua, and Parma were too weak to venture on an independent policy. Italy was indeed a Spanish province.

Two of the Italian States alone maintained their dignity and independence: the Duchy of Savoy, and the Republic of Venice; and in these two regions were comprised all that was best in Italian life of the period.

Emanuele Filiberto was the second founder of the House of Savoy. With his sword he regained the inheritance of his family, and then devoted his attention to performing the duty of a restorer and legislator to his people. His son and successor, Charles Emanuele I. (1580-1630), ambitious, bold, restless, endeavored by a continual series of wars to aggrandize his states. Through an agreement with France, he obtained the Marquisate of Saluzzo, ceding in exchange la Bressa and other territory on the Rhone. It was an advantageous exchange for him, for in this way the French were totally excluded from Italy. He then sought an alliance with France in order to wrest Lombardy from the domination of Spain, but the unexpected death of Henry IV. prevented the execution of this great design. Spain demanded that he disarm; but, instead of obeying, he invited the Italian states, and particularly Venice, to combine against Spain in a war of independence. However, none of them accepted his invitation; but, unaided for many years he bore the assaults of the Spanish arms, showing that, in the midst of the military decadence and the political enervation of the various states of the peninsula, there was one who knew how to maintain the dignity of the Italian name!

His last war was for the succession to the duchies of Mantua and Monferrato, in which Spain also took part, as did the Emperor and France. The whole upper Italy was traversed and devastated by various foreign armies, who also spread the plague. These were the sorrowful years described by Alexandro Manzoni in his historical romance, 'I Promessi Sposi.' The war still continued when Carlo Emanuele died.

Vittorio Amedeo, his son and successor, signed a peace by which he obtained the greater part of Monferrato, but ceded Pineolo to France, who once again got a foothold in Italy. The prime minister of France, Cardinal Richelieu, succeeded anew in forming a league against Spain, which was joined by the Dukes of Savoy, Mantua and Parma. The war had scarcely begun when Vittorio Amedeo died (1637). His widow Maria Christina, called Madame Royale, assumed the regency in the name of her son; but her cousins, Cardinal Maurizio and Prince Tommaso wished to be associated with her in the government, and to this end they sought the aid of Spain. The Duchess, in her turn, had recourse to France, and thus Piedmont was once more traversed and devastated by Spanish and French soldiery. At length the princes of Savoy perceived that foreign powers were taking advantage of their dissensions for their own profit, and thought it best to come to an agreement among themselves.

During this time the King of France, Louis XIV., was attaining an extraordinary powerful kingdom, the weight of whose authority could make itself easily felt even in little Piedmont until the day when Vittorio Amedeo II. of Savoy, in order to put an end to this servile friendship, formed an alliance with the other powers against France. Louis XIV. sent to oppose him one of the armies that devastated Piedmont; but the Duke of Piedmont sustained his disasters with courage, and at the conclusion of peace (1696) was not only able to compel restitution of his territory that had been occupied during the war, but also of the city of Pinerolo, ceded to France 60 years before.

In the second half of the 16th century Venice was apparently at the zenith of her power and prosperity, and her great painters, Titian, Tintoretto, Paolo Veronese, etc., by their *chef-d' œuvres* proclaimed her triumph to the world. In reality, however, she was depending on the wealth gathered in the past. Her power was already seriously threatened. In 1570 the Turks attacked Cypress, and notwithstanding the long and glorious resistance of the Venetian troops, they succeeded in taking possession of the whole island. The Christian League, formed at that time through the zeal of Pope Pius V. armed a great fleet which gained the memorable victory of Lepanto over the Turks in 1571; but

the results were meagre on account of the jealousy between the allied powers.

The Republic, while professing zeal in religious matters, had always upheld the rights of the State in opposition to those of the Church. On that account it waged a lively dispute with Pope Paul V., who, annoyed at seeing his demands disregarded, excommunicated the Republic (1606). Venice, who had chosen to consult Friar Paolo Sarpi, commanded the priests to continue the exercise of their worship under penalty of being banished from the territory, and almost all obeyed. Finally, through the interposition of the King of France, the Pope and the Republic came to an agreement.

From now on, Venice became even less interested in Italian affairs, and in the Orient she sought only to defend against the Turks her farthest possessions. After a long war Candia passed under the dominion of the Turks. In 1684 Venice again took arms against the Turks, having as allies the Emperor and the King of Poland. Her great general, Francesco Morosini, conquered at that time the Peloponnesus, but on his death (1694) the era of the great Doges of Venice came to an end. Twenty years later the Peloponnesus again came under the power of the Turks.

Spanish domination in Italy lasted until the first years of the 18th century, and left sad traces behind it. No government ever took less care of its subjects than the Spanish government, which looked upon Italian provinces as lands that they might despoil, but not govern. The taxes became daily more intolerable, and the income which the government received from them was not disbursed for the advantage of those who paid them, but went to enrich the viceroys sent to Italy, to maintain the pomp of the court of Spain, and the enormous expenses of the wars which this power had to carry on in many parts of the world. There were frequent insurrections, notably that of Naples (1647) which is associated with the name of a young fisherman, Masaniello; but the government always succeeded in suppressing them by temporary concessions which did not alter the true condition of affairs.

Contested Predominance Between France and Austria (1700-1789).—The death of the King of Spain, Charles II. (1700), and the war of the succession precipitated a long war between the French dynasty of the Bourbons and the German house of Hapsburg, supported by England and Holland. The Imperialists sought to retain possession of the territory which Spain had in Italy; hence, the war was carried on largely in the Italian peninsula. The Duke of Savoy, Victor Amadeus II., was at first supported by the Bourbons, but when they understood their own interests better, and being advised by their illustrious cousin, Prince Eugene of Savoy, commander-in-chief of the Imperial army, they went over to the Imperial army. Then Piedmont was invaded and traversed in every direction by the French, who ended by laying siege to Turin (1706). Among the many glorious episodes during its defense is that relating to a private of the Miners, Pietro Micca, who at the sacrifice of his life saved the citadel from a nocturnal surprise assault. On 7 Sept. 1706, Duke Victor Amadeus II. joined his troops to those under the command of Prince Eugene, and gained a great victory under the walls of Turin, in consequence of which the French were obliged to vacate Piedmont and the rest of Italy. In short, the Spanish domination came to an end in Italy. By the Peace of Utrecht Sicily was given to Victor Amadeus II., who assumed the title of King. Sardinia, Naples, and Lombardy were yielded to Austria. But a few years later the Italian Cardinal Giulio Alberoni, who had become prime minister to the King of Spain, attempted to regain possession of Sardinia and Sicily; but being threatened by the principal powers of Europe, the King of Spain retired his fleet and discharged his minister. Austria profited by this opportunity by compelling Victor Amadeus II. to exchange Sicily for Sardinia (1720). Austria, however, did not long retain Sicily and Naples; for one of the sons of the King of Spain, Charles of Bourbon, taking advantage of the war of succession in Poland which upset all Europe, seized these territories and founded the Bourbon Neapolitan dynasty (1734). To make up for this loss the Emperor Charles VI. received the Duchy of Parma and Piacenza, in which the Farnesi dynasty was extinct; and on the extinction of the House of Medici (1737) he assigned the grand duchy of Tuscany to Francis of Lorraine, husband of his daughter Maria Teresa.

The death of the Emperor, Charles VI., (1740) gave rise to a fresh war of succession, which lasted eight years, and covered with blood many regions of Europe. In Italy the French and Spaniards attempted to wrest from Austria both Milan and the duchy of Parma and Piacenza; but the Empress Maria Teresa was aided by the King of Sardinia, Carlo Emanuele III. Maria Teresa then sought to reconquer Naples, but the army she sent out was defeated at Velletri (1744). Meanwhile the French and Spanish fought, in alliance with the Republic of Genoa, renewing their attacks in Lombardy; but after a few successes they were repulsed. Also the Austrians advancing as far as Genoa placed heavy tribute and humiliations on the people, but the inhabitants of Genoa rose up and repulsed them (1746).

The year after the French and Spanish attempted to cross into Piedmont by way of the Colle dell'Assietta, but were routed. The only important change that took place in Italy in consequence of this war was the assigning of the duchy of Parma and Piacenza to Don Philip of Bourbon, son of the King of Spain.

After the treaty of Aquisgrana, which signalized the end of this war, Italy enjoyed a long period of peace (from 1748-1792), which the various states of the peninsula devoted to their internal development. A current of new thought had overrun the whole of Europe through the writings, specially, of French authors; and these had given rise everywhere to a sort of tendency towards reform, animated by a principle of toleration in matters of religion and by the idea of the need of a great social regeneration to insure a greater degree of justice among men. The governments ended by accepting these and sought to put them in practice, the more willingly because the abolition of the privileges enjoyed by the nobles and the clergy represented

an advantage for the sovereigns and also pleased the people, who were thus freed from a thousand annoyances, burdens, and vexations.

In Naples, Charles of Bourbon (1734-1759) acquired a good character for his civil and ecclesiastical reforms. In the other branch of the Bourbons, at Parma Duke Philip (1748-1765), who introduced great reforms, was succeeded by his son Ferdinando, who abolished even those already established.

In Lombardy, on the other hand, under Maria Teresa (1740-1780) was inaugurated a period of material and intellectual regeneration; and Joseph II., who succeeded her in the government, prosecuted reforms with even greater energy than his mother. Thus also in Tuscany, where Francis of Lorraine (1738-1765) was succeeded by Peter Leopold (1765-1790), who may justly be considered the greatest of the reform princes of Italy.

French Preponderance (1789-1815)—The breaking out of the French revolution produced a two-fold effect on Italy. Her rulers, in terror, halted their reforms, whilst the people, excited by the news from Paris, began to desire a change in the order of things with more eagerness than ever. Hence arose discords which daily became more aggravated, when arrests and torture were resorted to to suppress the revolutionary spirit.

Piedmont, together with Austria, opened the war against France in the summer of 1792, and the French were victorious, and in the same year, 1792, took Savoy and Nice. In 1796 the young general, Napoleon Bonaparte, separated the Austrian army from that of Piedmont; obliged King Victor Amadeus III. to make peace; then penetrated into Lombardy in pursuit of the Austrians, and by a series of brilliant victories secured possession of it. These events awoke Italy from her torpor, and encouraged the secret aspirations of the people. Reggio and Modena rose in insurrection against the duke, and uniting themselves to Bologna and Ferrara, which had been wrested by the French from the rule of the Pope, they organized a republic, called Cispadana, which adopted the Italian tri-colored flag with the white and red of the French flag substituting green for blue, a color which was in use among the local militia.

Bonaparte also invaded the Pontifical States, obliging the Pope to subscribe to burdensome conditions of peace; then he pursued the Austrian army across the Alps as far as Leoben, at which place Austria decided to conclude preliminaries of peace (April 1797). Just at this time, in Verona, the populace and the peasantry rose in arms against the French and butchered them (Pasque Veronesi). This insurrection was quickly wiped out in blood, but General Bonaparte made use of it as a good pretext for an attack on the aristocratic Republic of Venice, and by threatening war, he compelled it to transform itself into a democratic government. In Genoa also, by Bonaparte's orders the ancient form of government was abolished and the Ligurian League restored in imitation of the French government. Lombardy, which had been retaken from Austria, was made part of the Republica Cispadana and they became one republic, called the Cisalpine Republic.

In October 1797 peace was agreed on with Austria at Campoformio, in Friuli. By the terms of peace Austria was to renounce possession of Lombardy, but received instead the territory of the Republic of Venice, which from this time ceased to exist. The cession of Venice to Austria gave the lie to the fine promises of liberty and independence that had been made by the French invaders, which was probably the reason for the harassing attacks and the plundering expeditions that occurred in the Cisalpine and Ligurian republics, which were now considered almost as vassals, which fact caused great dissatisfaction among the Italian populace. However, the two years (1796-97) showed a great awakening in the life of the peninsula.

In 1798 the French, on the pretext that the house of the French ambassador had been violated, took possession of Rome, declared the government to have fallen into decadence, and established a republic. Then, as the King of Naples had dared to declare war on them, they entered Naples and proclaimed a republic there, which they called Parthenopea, from the ancient name of the city. On hearing the news that Austria, in alliance with Russia and England, meditated a fresh descent into Italy, the French took possession also of Piedmont and Tuscany.

But the Austro-Russian army entered Italy in the spring of 1799, and repeatedly defeated the French, so that the latter were forced to retreat into Liguria. Naturally the republican governments, which had been established by them, not having sufficient standing in the country, were overthrown, and many of the citizens who had compromised themselves by the favor with which they accepted the new ideas were obliged to emigrate. The republicans of Naples capitulated on the promise of amnesty; but King Ferdinand and Queen Maria Carolina violating their promises took fierce vengeance on the heads of the republican government. Among them were Doctor Domenico Cirillo, Judge Mario Pagano, Francesco Conforti, Admiral Francesco Caracciolo, etc.

Napoleon Bonaparte assumed the rule in France, with title of First Consul. He intended to reconquer Italy, where the French now owned only Genoa, and even here they found themselves besieged. Massena, commander of the French army, shut up in Genoa, held out heroically until 4 June 1800. In the meantime Napoleon at the head of another army entering Italy by way of the Saint Bernard threatened the Austrians from the rear and forced them to retreat towards Lombardy. At Marengo, near Alexandria, on 14 June 1800, a great and decisive battle was fought. The Austrians were forced to abandon all their conquests and again confirm the Treaty of Campoformio. Napoleon re-established the Cisalpine and Ligurian republics, and annexed Piedmont to France. The Neapolitan and Austrian troops evacuated Rome, which was presented to the new Pope Pius VII. Shortly after this Parma and Piacenza were ceded to France, and the Bourbons, who owned that duchy, were given Tuscany, which was made into the Kingdom of Etruria.

At the close of 1801 Napoleon convoked a meeting at Lyons of 452 leading men of the Cisalpine Republic for the purpose of forming

the new constitution, which was to be similar to that which then obtained in France. The republic was to be called Italian, and Napoleon Bonaparte was elected president. He nominated Francesco Melzi as vice-president. From this time the evils consequent on the military occupation of the preceding years began to diminish and this republic was able to enjoy true prosperity. The name of Italian Republic was pleasing to the people, and as the president was at a distance their independence seemed all the greater. Melzi knew how to attract general sympathy and governed wisely. But when Napoleon became Emperor of the French he changed the Republic of Italy into the Kingdom of Italy, and was crowned at Milan 26 May 1805. He named as vice-regent Eugene Beauharnais, a youth of good and gentle disposition who endeavored to show his gratitude toward the Emperor by a blind obedience. As a result of the war of 1805, Austria had to renounce Venice, which became part of the Kingdom of Italy, to the great joy of the Italian people, who flattered themselves that this was the first step towards the unification of the entire peninsula. Instead of that, Napoleon drove the Bourbons out of Naples, and made of it a separate kingdom, placing his brother Joseph Bonaparte on the throne. Then, as he had already annexed Liguria to the French crown, he also annexed Tuscany and Latium, leaving to the Kingdom of Italy only the Marches. With this invasion ceased the temporal power of the popes (1809).

Thus the whole Italian peninsula was dependent directly, or indirectly on Napoleon. The house of Savoy retained only the island of Sardinia; and the Bourbons of Naples Sicily. Napoleon, who moved the kings about as though they were chessmen, in 1808 raised his brother Joseph to the throne of Spain, and sent to Naples in his stead his cousin Joachim Murat.

A great change had taken place, materially, intellectually, and socially, in the Napoleonic dominions. New roads were opened, large canals dug, splendid monuments erected, agriculture encouraged, industry and commerce favored, letters and the fine arts promoted. But his despotic will alienated Napoleon's subjects, especially when they remembered that having attained such great power, nothing could hinder his ambitious aims, and that to satisfy his own vanity he was always ready to sacrifice the lives of his soldiers. Hence, when his hour of disaster came he found little support in Italy.

In the autumn of 1813 Austria advanced threateningly on the kingdom of Italy. The viceroy, Eugene Beauharnais, attempted to defend it, but in vain, particularly as the King of Naples, Joachim Murat, in order to retain his own throne, had entered into secret negotiations with Austria, and had also led an army towards upper Italy. The Austrians had already occupied a great portion of the kingdom when the news arrived in Italy that Napoleon had been forced to abdicate. Then arose an insurrection in Milan against the French government. Count Prina, minister of finance, was massacred by the mob (April 1814). In consequence of these outrages, the viceroy, Eugene Beauharnais, left the kingdom. Milan was occupied by the Austrian troops.

Almost all the former governments were restored. The Pope, Pius VII., re-entered Rome. Duke Ferdinand III. took back Tuscany. The duchies of Parma and Modena were re-established. Victor Emanuele I. of Savoy re-entered Turin.

Joachim Murat alone retained the kingdom of Naples; but he soon had reason to doubt that Austria would keep the promise she had made him. He therefore, became reconciled to Napoleon, who was then in the island of Elba, and when he left it to set out on the marvelous 100 days, Murat took up arms against Austria, inviting Italy to assist in a war of independence. He was defeated, and obliged to renounce the throne (20 May 1815). From Corsica, whither he had fled, he tried to re-conquer Naples, but was made prisoner at Pizzo in Calabria, and shot (13 Oct. 1815).

PIETRO ORSI,
Professor of Modern History, Royal Lyceum of Venice.

6. Italy—History from 1815 to 1907. Before the French Revolution, the territory, which now forms the Kingdom of Italy, was inhabited by about 17,000,000 people and was composed of nine principal states: The Kingdom of Sardinia with Piedmont and Savoy; the Republic of Genoa; the Duchy of Parma and of Piacenza; the Duchy of Modena; the Republic of Venetia; the Republic of Lucca; the Grand Duchy of Tuscany; the Pontifical States; the Kingdom of Naples with Sicily; and besides two regions belonging to foreign powers, *i. e.* Corsica to France, and Lombardy and Mantuoa to Austria. In these countries the political, social, economic, judicial, financial and intellectual conditions were deplorable; the power of the sovereign was absolute; the population was divided into classes, some of which possessed remarkable and varying privileges; industry, commerce and agriculture were neglected, with consequent poverty of the laboring classes; justice was meted out unfairly to all, barbarously conducted and with no proportion between the crime and its punishment; the public finances were in a ruinous state; education was very limited and difficult to acquire. Into this Italy, so complex and unprogressive, came the French Revolution (1789-1814) with the arms of the Republic and of the Emperor; destroyed the existing states and set up and supported the *Glorious Principalities* of 1789. After undergoing various transformations, Peninsular Italy (Sicily always belonged to the Bourbons of Naples, Sardinia to the House of Savoy and Corsica to France) was thus partitioned by Napoleon I.: one part was united to the French Empire (Piedmont, Liguria, Parma and Piacenza, Tuscany, Umbria, Lazio); a second part formed the Kingdom of Italy, which was destined to become independent under its own king, with the capital at Milan (composed of Lombardy, the Province of Venetia, Modena, the Province of Rome and the Marches); a third part, with the title of the Kingdom of Naples, was held successively by two French kings, Giuseppe Bonaparte and Gioacchino Murat, with a certain independence. In these countries, through the initiation of foreign folk, but with the coöperation of many Italians also, arose a

period of economic activity; streets were opened; institutions were founded for the progress of science and the diffusion of knowledge; the government and administration of affairs became vastly superior to what had preceded; and the equality of all before the law was established. The moral, civil and economic progress throughout the entire peninsula was very evident and very considerable; but the people ended in becoming very discontented because of the incessant levies, which robbed the country of the flower of its youth, following the military enterprises of Napoleon, and also because of the enormous taxes which the emperor imposed upon every one according to his own despotic will. When the Napoleonic dynasty fell, the United Powers, which had overthrown it, in order to wipe out every trace of the revolution in Italy, wished to reëstablish the states exactly as they were before the coming of the French (except the republics, which were not reconstituted), and they recalled the former sovereigns, and the entire country was placed under the rule, direct or indirect, of Austria, who had driven the French out by force of arms.

The Treaties of Paris and the Congress of Vienna (1814-1815) finally reorganized Italy in the following manner: there were seven principal states, nominally independent, and two regions governed by foreign rule. The independent states were: (1) The Kingdom of Sardinia, to which the House of Savoy returned, which had at its head Victor Emanuel I., and to which was also given the territory of the former Republic of Genoa; (2) The Duchy of Parma and of Piacenza, given to Marie Louise of Austria, the wife of Napoleon I.; (3) The Duchy of Modena, to the Archduke Francis IV. of Austria; (4) The Grand Duchy of Tuscany, to Ferdinand III. of Austria; (5) The Duchy of Lucca, to Maria Louisa of Bourbon; (6) The Pontifical State, to which Pius VII. returned freed from prison; (7) The Kingdom of the two Sicilies, *i. e.* Naples and Sicily, to which Ferdinand IV. (now become I.) of Bourbon returned. The regions subject to foreign powers were: Corsica, which remained French, and the Kingdom of Lombardy-Venetia, which passed to the House of Austria. The latter, therefore, possessed incontestible power in all Italy, since in addition to the direct authority over the Kingdom of Lombardy-Venetia, it had its own princes in power over Tuscany, Parma, Modena, and exercised a sort of guardianship over the other states. Austria, the centre of reaction in Europe, represented in Italy the Holy Alliance, which had the plan to reëstablish the divine right of monarchies and to hold the people quiet and submissive, and to carry out this plan the sovereigns belonging to the Alliance were obliged to help each other whenever called upon.

The returning princes were well received, because the allied powers had fraudulently promised that they would not forget the aspirations of the nation, and because the people hoped that, not only would the excellent institutions founded by France be preserved, but also that there would be an end to the waste of money and of blood which characterized the last years of the oppressive Napoleonic régime. The princes, on the contrary, enraged against everything that reminded them of the usurpers, gave themselves up to destroying all that the revolution had created. They banished or humiliated every one who had received offices from France; abolished all liberty of thought, of the press, of speech; reëstablished the ancient laws which provided for privileged classes; denied civil rights to Hebrews and to Protestants; gave excessive power to the clergy, and restored to courts of justice the savage methods which barbarity had formerly furnished her. Education became possible to only the few. In this mad reaction the Piedmont and Napoleonic Government distinguished itself especially. The King Victor Emanuel I. of Sardinia said that he considered that he had slept all the years of his exile, and that he desired that his subjects should do so hereafter; therefore, he endeavored to establish the state in every place exactly as it had been before the revolution. Discontent soon manifested itself everywhere. The people, finding themselves in an unjust and unbearable situation, commenced a Titanic struggle by means of secret societies, of conspiracies, of revolutions, even of open war, which lasted from 1815 until 1870, and finally made Italy one, free and independent; after which the new state was able to develop its own powers in such a way as to attain in a very short time that grade of prosperity and success in which it finds itself to-day.

The years from 1815 to 1907 are those of the *Italian Resurrection*, which should be divided into a *Political Resurrection* (1815-1870) and an *Economic Resurrection* (1870-1907), and embraces five periods: (I) Conspiracies and insurrections promoted by the Carbonari (1815-1831); (II) Conspiracies and insurrections promoted by «Young Italy» (1831-1846); (III) Action by the political neoguelfic school (1846-1849); (IV) Work under the direction of the House of Savoy and the foundation of Italian Unification (1849-1870); (V) Development and progress of free Italy (1870-1907).

Period I.—*Conspiracies and Insurrections Promoted by the Carbonari* (1815-1831).—The general discontent, the necessity of a radical change in public affairs, and the impossibility of displaying their own aspirations in the full light of day, compelled the Italians to form secret societies by means of which they hoped to attain their prohibited ends. In this first period the Carboneria was the principal one, an emanation from the Mazzoneria, whose symbols and language they had preserved; it arose in Naples during the reign of Murat, and was propagated after the return of the Bourbons for the organization of the oppressed against their oppressors, and hence spread throughout all Italy between 1815 and 1820. It enrolled among its members especially persons of the middle class, professional men, employés, the military, and also some nobles. The sections called themselves Vendite (Avengero). The society gradually disbanded and the subdivisions assumed contrasting and fantastic names: Society of the Filadelfi, of the Adelfi, of the Maestri Perfetti (perfect masters), of the Spilla Nera (black pin), of the Federazione (confederation), etc. The program common to

all was: independence of all foreigners, a form of liberal government, and the confederation of all Italian states, which did not exclude the fact that some of the Vendita (Avengers) changed this general program, in so far that instead of the Confederated Italy they wished one Italy under the republican form of government, not the monarchial. The reactionary government, which feared the Carboneria, gave their countenance to some societies formed with the opposite designs, the more important among which were the Calderari and the Sanfedisti. The history of Italy from 1815 to 1831 is contained in the history of the Carboneria.

The first revolutionary movement broke out in 1817 in Macerata, in the Marches, where the Carbonari were numerous, and was at once repressed by the Papal Government. In 1819 the Austrian police discovered a Carboneria conspiracy in Polesine in Rovigo, arrested many persons implicated, who were found guilty and put into prison, together with Pellico, who recorded in a book called 'Le Mie Prigioni' («My Prisons»). In 1820, after *Il Conciliatore,* organ of the liberal patriotic party, had been suppressed, the discovery of other conspiracies led to the arrest in Milan of Pietro Maroncelli and of Silvio Pellico, followed by the arrest of Federico Confalieri, head of the conspiracy, of Giorgio Pallavicino, of Gaetano Castiglia and a hundred others, who, found guilty during the years 1821-1824, went to populate the dreadful Austrian prisons, the most notable of which is the Castle of Spielberg in Moravia.

In Naples, the Carboneria conspirators were very numerous, especially in the army, and it was precisely the army which initiated the Revolution of 1820-1821. On 2 July 1820, their spirits roused by the triumph of liberty in Spain, two officers and 130 soldiers started from Nola towards Avellino to the cry of «Liberty and a Constitution»; then uniting themselves with two insurgent regiments under Guglielmo Pepe, whom they proclaimed their general, they all went to Naples, where the king, taken by surprise and also under compulsion of the citizens, promised a constitution, to which he swore fealty (13 July), invoking the lightnings of the Almighty upon his head if ever he violated it. In Palermo also the people rose, but in Sicily the movement took the form of a Separationist Movement, so that the constitutional government at Naples was obliged to send two generals to overcome the insurgents and preserve the union of the two parts of the kingdom. Meanwhile the king, breaking faith, invoked the aid of the sovereigns of the Holy Alliance, who invited him to Lubiana, where in January 1821 they held a congress. The king had promised to defend before the allied sovereigns the constitution to which he had pledged himself; but instead, the powers decided to intervene in the affairs of the Neapolitans by force of arms in order to reëstablish the absolute monarchy. An Austrian army, commanded by General Frimont, invaded the kingdom, conquered the constitutionalists led by General G. Pepe, at Antrodoco, entered Naples 23 March 1821, and then occupied Sicily. The constitution was abolished; those who had headed the movement were cast into prison, some were sentenced to death, and many were exiled.

In Piedmont, where the Carboneria was more commonly known as the Federazione (the Confederation), the Revolution of 1821 had two objects: to obtain a constitutional government and to drive the Austrians from the peninsula, in order to form with the House of Savoy a kingdom of all northern Italy. The promoters of this were chiefly officers of the army belonging to the principal aristocratic families, and they believed that the young prince and heir-presumptive to the throne, Carlo Alberto of Savoy-Carignano, was also of their party, since in private conversations with his friends he made no attempt to conceal his ardent love for the independence of his country and his desire to do something for her. The insurrection burst forth when it became known that an Austrian army had arrived at Naples to quell this revolution, and they believed that they could attack it from the rear with the help of the Lombardy-Venetians, who were to rise at the call of the Piedmontese. On 10 March 1821 a regiment in Alessandria rose, and formed there a provisional government, and during the days following other garrisons arrived in that city, some soldiers, at the gate of Turin, shouting for the constitution, raised the tri-colored banner; and the king, Victor Emanuel I., who felt that he could not change the order of events and did not wish to use violence against his subjects, abdicated in favor of his brother, Carlo Felice, naming as regent during the latter's absence, the Prince of Carignano, who, in obedience to the demands of the people, conceded the Spanish constitution. But the king, Carlo Felice, in Modena, annulled this concession, ordered Carlo Alberto to withdraw into Tuscany, assembled that part of the army which had remained faithful, and called for help from Austria. The soldiers in favor of the constitution were beaten (8 April) near Novara; the heads of the movement—the most famous of whom was Santorre of Santarosa—in order to escape the gallows, were obliged to exile themselves in Spain, Portugal, Greece, France or England.

These attempts at gaining liberty were followed by ten years of frightful reaction, in Piedmont as well as at Naples and everywhere in Italy. Austria more than ever was master of all; nevertheless, the Carboneria, beaten but not destroyed, continued to work in secret.

When in 1830 upon the accession of Louis Philippe to the throne of France, it seemed that the liberal aspirations of Europe had found strong and secure foundations, the patriots of central Italy hoped to be able to form a kingdom with a constitutional government, consisting of Lombardy, Modena, Parma, and Ferrara; a kingdom which they would give to Francesco IV., Duke of Modena, who had much ambition and great wealth, and who they knew had an understanding with the Carboneria and was a friend of one of their most highly esteemed chiefs, Ciro Menotti. It is said that at the last moment the duke was seized with fear of being discovered and severely punished by Austria, and therefore abandoned the conspiracy. Menoti, in consequence of this, wished to anticipate the revolution; but on the night appointed for the rising (3-4 Feb. 1831) the duke, with 800 soldiers, surrounded his house and took him, with many others, prisoner; and when he

knew that the revolution was so widespread throughout the state, he repaired to Mantova, taking with him Menotti, to be under the protection of the Austrian cannon. This revolution extended to the Pontifical State, where Bologna (5 February) and later other cities rose in rebellion; the temporal power of the Pope was declared abolished, and they founded, together with Romagna and the Marches, a free state which they called the United Provinces. From Parma also the Duchess Maria Louisa was obliged to flee and take refuge in Piacenza. The Austrians, called upon for help, intervened, overcame the Italians and again established in every place the preceding government. The Duke of Modena was savage in his revenge; shortly after his return Ciro Menotti and others were hanged on the gallows. The foreign powers in a Memorandum publicly invited Pope Gregory XVI. to give to his state a more pacific administration; but the Pope, instead of ameliorating public administration of public affairs gave himself up to a violent reaction, so that in 1832 the revolution again broke out. The Austrians returned, and the French occupied Ancona in order not to leave Italy in the power of Germans alone, and neither of them took their departure until 1838.

All these movements of the Carboneria, therefore, failed, because they were successive, not contemporaneous; because they were not sufficiently prepared and not wisely guided; because, being the work of the minority, they were not participated in by the people; and finally, because their plans were to establish a kingdom, not a nation.

Period II.—*Conspiracies and Insurrections Promoted by «Young Italy»* (1831-1846).—The impossibility of obtaining independence and freedom for Italy by means of the Carboneria was impressed upon the people chiefly by Giuseppe Mazzini (1805-1872) of Genoa, who had been a member of this society and in 1830 by a piece of ordinary treachery had been cast into prison. While incarcerated in the fortress of Savona, he conceived the idea of forming a new association, which should be national and not sectional, and which while preparing in secret for a revolution, should openly propagate its principles by means of the press. Released from prison, he was obliged to go into exile, and in Marseilles he became convinced that it was useless to expect any generous initiative on the part of any sovereign; he therefore (from among the many Italian refugees of the Revolution of 1820-21 and that of 1831) founded in 1831 «Young Italy,» an association of persons who believed in the law of progress and duty, and who were obliged to swear to work—by means of education and insurrection—to the end that Italy should become one, free, independent and republican. To disseminate the ideas and the aims of the association they published a periodical (1832) entitled *La Giovane Italy* («Young Italy»), and the society and the paper spread throughout the peninsula, especially in the kingdom of Sardinia, in which the king, Carlo Felice, the last of the eldest branch of the house of Savoy, had been succeeded by Carlo Alberto of Savoy-Carignano. Upon this state Mazzini founded his greatest hopes, because he was convinced that having brought under the influence of these new ideas the Piedmontese army, the chief military force of the Italian states, the society would be able to drag down the tyrants from their thrones and hunt the foreign oppressors from out the land. Therefore they sought above all recruits from the Sardinian army. But the police were not slow to discover the conspiracy in 1833, and proceeded to make arrests in Geneva, Alessandra, Chambery, and other places. Vicenzo Gioberti, not being able to disprove his guilt, was sentenced to exile. Standing courts were immediately set up, which instituted proceedings that ended with severe condemnations and punishment of soldiers and citizens. Young Italy then sought her revenge. An expedition composed of some hundreds of Italians, Poles, Germans and Swiss, prepared by Mazzini, invaded Savoy from Geneva (1834); but, not finding help from the inhabitants, was easily repulsed by the soldiers of the king. Genoa, which was supposed to rise at the same time, did not stir; there followed at once condemnations of the conspirators, among which was a sentence of death against Giuseppe Garibaldi (1807-1882).

Young Italy remained stunned by these severe blows for some years, but after a decade had passed she again became active. In 1843 at Savigno and in other places in Romagna, several revolutions against the pontifical government took place, but the insurgents were beaten, and many of them were imprisoned or condemned to death. A band of Calabrian patriots marched towards Cosenza (15 March 1844) and entered the place carrying the tricolored banner and shouting «long life to liberty and down with despotism,» but being attacked vigorously by the Bourbon militia, they were quickly dispersed. Information of this somewhat insignificant movement reached two courageous youths, brothers Otillio and Emilio Bandiera, of Venice, who, being of the same political faith as Mazzini, had abandoned the service of the Austrian marines (in which they were officers and their father an admiral) and had fled to Corfu, there to wait for the moment to strike a blow for liberty and their country. Having collected other exiles, among them Nicola Ricciotti, they set out for Calabria, where they believed that the insurrection was being carried on, and disembarked at Cotrone, not expected, not knowing to whom or where they should turn, but convinced that if the undertaking should end with the sacrifice of themselves, then such sacrifice would help the cause of Italy. Received in an unfriendly manner by the people—perhaps victims of treachery—they were attacked by the police and a battalion of the Bourbon military; some were taken prisoners, some were wounded and some were killed. A court martial condemned to death the survivors, who were shot near Cosenza, only a very few being allowed to go free. In 1845 the agitation by Mazzini induced the Romagnoli to make another attempt; Rimini rose and a provisional government was installed: but the liberal troops were put to flight by the Papal soldiers, and the rebels fled, reappearing in Tuscany.

These and other attempts all met with failure, because the people who should have made them succeed were not as yet sufficiently educated up to the national idea, and because the

number of insurrectionists did not suffice for the extremely difficult task of redeeming and uniting Italy.

Period III.—*Action of the Neoguelfa Political School* (1846-1849).—In 1843 Vicenzo Gioberti, an exile for ten years in Brussels, published there a book entitled 'Upon the Moral and Civic Preëminence of the Italians,' in which, with much eloquence, he developed the following conceptions: that Italy could rise again without recourse to insurrections; that this resurrection could come to pass, uniting the entire peninsula, by means of a confederation of her princes; that to establish this Italian unity two provinces especially should be active,—Rome, which should give the Pope as head of the confederation, and Piedmont, which should give its military force; that the princes should and would make wise and pacific reforms; and that Italy, thus leagued together, guided by a liberal Pope, would then rise to exercise that universal influence in action and in thought which she was destined to by her very nature. This book was rapidly disseminated throughout the peninsula and gave a great impetus to thought. In 1844 Cesar Balbo, in a work called 'Upon the Hopes of Italy,' argued that the confederation would be possible only after the Austrians had been driven out from Italy; he advised, moreover, above all that the young men should be instructed in arms for a national war. In 1845 Massimo d'Azeglio wrote 'Upon the Latest Developments in Roman Affairs,' in which he demonstrated that conspiracy, sedition, partial insurrections, could not but be injurious to the establishment of liberty; that they should, on the contrary, first give proof of their civic courage by demanding openly from the government liberal reforms and institutions; and then of their military courage by conquest—when the occasion should arise—of their independence from foreign invaders. Following the publication of these books, came many others, which argued the necessity of abandoning revolutionary movements, the advantage of looking frankly to the princes themselves for the reform of public ordinances, and the possibility of making liberty and religion go peacefully side by side. Thus they went on, forming a new political school, which was called «neoguelfa,» and of which Gioberti was the inspiration and the leader. The Neoguelfi, then, differed from the disciples of Mazzini in their aim and in their methods. In their aim, because deeming it impossible to take Rome from the Pope on account of the opposition which it would raise among Catholics throughout all Europe, they wished to substitute for the united republic desired by Mazzini, a confederation of princes presided over by the Pope; and they differed in their means because in place of popular and partial revolutions they wished to substitute pacific propaganda in order to obtain liberal reforms from the sovereigns, and preparation for national war in order to acquire independence.

This program seemed to be realized at once, for on 15 June 1846, Cardinal Giovanni Mastai-Ferretti was elected Pope with the name of Piux IX.; he was noted for his liberal sentiments, and his first act, most unusual, was a general amnesty to political offenders who filled the prisons of the pontifical state, which amnesty awakened enthusiastic joy, not alone in Rome but throughout all Italy. In 1847 other reforms followed, such as the concession of moderate liberty to the press, which allowed the foundation of various newspapers; the institution of a Committee of State, composed of the laity, and a Council of Ministers; and the organization of the Civil Guards. The populace not only applauded but were really delirious with joy and demanded that the sovereigns should do as much as the Pope. And in this way they influenced the Grand Duke of Tuscany, Leopold II., and the king of Sardinia, Carlo Alberto. The latter dismissed his reactionary minister, Solaro of Margarita, and in October and November 1847 he granted a moderate liberty to the press, improved the judiciary ordinances, conceded to the citizens the election of Municipal Councillors. Public enthusiasm was extraordinary and the names of Pius IX. and of Carlo Alberto were shouted to the stars. The movement extended throughout the peninsula and spread through all classes of the population, because the initiative came from the head of the Church and because literature had taken upon herself a civic duty and disseminated widely sentiments of liberty and independence. Every mode of literary expression became an instrument for patriotic propaganda. The romances of Guerrazzi and of d'Azeglio, the tragedies of Manzoni and of Niccolini, the poetry of Leopardi, of Berchet, of Rossetti, of Giusti and of hundreds of others recalled to Italians in words of fire their former greatness and glory and incited them to rise from the pitiful conditions into which they had fallen. Literature, painting and music had civic and national intentions.

The tiny spark which started the great conflagration was lighted in Sicily. The natives of Palermo rose in arms 12 Jan. 1848, and their example was promptly followed by the entire island; and as soon as they also rose in Naples, the king, Ferdinand II., who had not imitated Pius IX. and other princes in regard to reforms, was seized with great fear and did more than any of them, for he gave them directly a representative constitution. The excitement throughout the entire peninsula became enormous at this piece of news, and the sovereigns were forced to concede also everything which the most reactionary of the princes had ever refused. Carlo Alberto on February 8 promised and on March 4 published the 'Statute,' which, preserved by him and his successors, is still the foundation of all law in the Kingdom of Italy. Yielding to the persistent demands of the citizens, Leopold II. and Pius IX. also promulgated a constitutional statute. Having become free henceforth as far as the princes were concerned, the people could now think of securing freedom from foreign oppression, and a favorable occasion was not long in presenting itself.

When the news that on February 24 the Parisians had overturned the throne of Louis Philippe, arrived at Vienna, it incited an insurrection; the news that this insurrection at Vienna had caused the fall of Minister Metternich, induced Venice first of all to rise against the Austrians, drive them out and proclaim a

republic; then Milan in a heroic struggle of five days (March 18-23) succeeded in forcing the hated oppressors out of the city. Carlo Alberto thereupon on March 23 declared war against Austria and took the field to give independence to Italy. The Pope, the King of Naples and the Grand Duke of Tuscany were constrained by the demands of the people to take part in the expedition and sent soldiers into the Valley of the Po. But the Pope, in a proclamation on April 29—probably because he feared a schism in Germany—declared that he could not participate in a war against the Austrians because they were Christians; and the King of Naples, declaring that he had not set forth on this road to liberty of his own free will, came into conflict with Parliament, dismissed it, smothered in blood the agitations in the principal cities, and recalled to the kingdom the troops which had been started for the war. Carlo Alberto, who had arrived at Mincio, found himself consequently quite alone and deserted, but nevertheless he conquered the Austrians at Goito (May 30), but was in turn beaten in several encounters; he was forced to a retreat, which was rendered more disastrous by other defeats, and which terminated by the Armistice of Salasco (August 10), by the terms of which Lombardy and Venice, which had given themselves to the king, were left in the hand of the triumphant enemy. Venice, however, declared herself a republic under the Presidency of Daniele Manin, and thought of defending herself alone. The Pope, terrified by the rage of the Democratic party and by the assassination of the President of the Council of Ministers—Pellegrino Rossi—fled on November 24 to Gaeta near the King of Naples. In Piedmont, the radical party wished a renewal of the war, although the country was quite unprepared; and the king did commence it again, but in a very few days all was over. At Novara (23 March 1849) the Sardinian army was completely defeated by the Austrians, and on the same evening, Carlo Alberto, convinced that the conquerors would make better conditions with another sovereign, abdicated in favor of his eldest son, who became King Victor Emanuel II., and retired in exile to Oporto in Portugal, where he died July 28 in the same year.

Two glorious conflicts ended this first unfortunate war for Italian independence.

The Pope having fled to Gaeta and being invited in vain to return, a Constitutional Assembly (9 Feb. 1849) abolished by proclamation the temporal power of the popes and set up the Roman Republic. Pius IX. called for armed intervention from the Catholic nations to recover his temporal domain, and Naples, Spain, Austria and France took arms. Rome prepared to defend herself and Italians from all over the peninsula flocked to her standards. General Giuseppe Garibaldi, although he was not commander-in-chief of the military forces of the republic, played a most splendid part. A triumvirate, composed of Giuseppe Mazzini, Aurelio Saffi and Carlo Armellini, with unlimited power, provided for the public necessities. The Austrians occupied Bologna and took possession of Ancona; the Neapolitans were compelled to halt at Velletri by Garibaldi; the Spaniards, disembarking from their ships, covered themselves with ridicule. The French, landing at Civitávecchia under the command of Oudinot, were driven from Rome April 30. And when they turned against Gianicola (Janiculum) (where rose the greatest number of epic deeds of blood), the defenders in numerous attacks from the 3d to the 30th of June gave extraordinary proofs of valor and sacrificed many noble lives. But the enemy nevertheless constantly approached nearer the city and bombarded it. The French finished by entering Rome, while the Constitutional Assembly in the Campidoglio ordered the army to «cease a defence which had become impossible and to remain at its post.» The triumvirate was dissolved, and Garibaldi with some of the best of his men left the city July 2 and, pursued by France and Austria, commenced that famous retreat in which he aimed to go to the help of Venice, still in a state of siege, and during which he lost his heroic consort Anita.

Venice, turned republic, had decided to resist at all cost the Austrians who were besieging her; and splendidly did she keep her word. Surrounded by a circle of iron which each day grew closer, bombarded day and night, tortured by hunger and cholera, after a defence which was an honor not only to the city herself but to all Italy, she was obliged to capitulate on August 24, and her most strenuous champions went into exile.

Thus, after the attempts of the Carbonari and those of Young Italy, the efforts of the Neoguelfi also failed. Put to the test of deeds, their program had proved itself impractical, although they had proved that it was useless to hope for anything from the liberality of princes irremediably retrogressive; that it was disastrous to start the campaign with unprepared popular forces against a strong enemy hardened to war; that it was unwise to commence the struggle for independence without first spreading and disseminating throughout the entire country the sentiment of duty toward one's country. At all events the errors as much as the heroism of 1848-49 would serve as education to all Italians in the near future.

Period IV.—*Direct Action by the House of Savoy and Formation of United Italy* (1849-1870).—Austrian dominion over Lombardy and Venetia having been established by force of arms, Marshal Radetzky desired to render impossible any fresh attempts at independence, and spread everywhere fear and terror with his savage military action; and to this end he constantly caused the arrest, condemnation and punishment of citizens guilty of having taken part in the deeds of 1848-49, of having in their possession arms or patriotic publications, or of having uttered generous sentiments concerning Italy. The result of this violent oppression was a new conspiracy, promoted by Mazzini, now an exile in London; this conspiracy had its centre in Mantova and was to prepare for a popular insurrection in Lombardy-Venetia in order to drive out the intruder and to establish the republic. At its head was the priest Enrico Tazzoli. Some traces of the plot having been discovered by the police, many persons were arrested whose names appeared on the lists of the conspirators; the prisoners were treated in

the most infamous manner by the State Tribunal; and on 7 Dec. 1852, Tazzoli and four other patriots were hanged on the pavement of Belfiore. Mazzini made speedy answer to this severity, inciting on 6 Feb. 1853 an insurrection in Milan, which was the cause of fresh condemnations and fresh punishments. The consequence was that the proceedings of Mantova were repeated, and ended with a decree that sent to the gallows other patriots. Austria, seeing that she would never succeed by violent measures in ruling the spirit of Lombardy-Venetia, tried to draw her to herself by more gentle measures; so the Arch Duke Maximilian was entrusted with the government of the Italian provinces. But it was now too late. On 15 Jan. 1857, upon the same day that the Emperor with his wife entered Milan, the Milanese displayed their feelings towards him by dedicating to the Sardinian Army a monument commemorating the first war of Italian independence, which was placed in the Piazza Costello in Turin.

Reaction raged also in other Italian states, especially in the kingdom of the two Sicilies, where the government of Ferdinand II. was, because of its odious character, called by Gladstone a «denial of God.» All those who had taken part in the movement of 1848-49 were frightfully persecuted at Naples and in Sicily.

Thus, between 1849 and 1859 there raged throughout the peninsula the most unjust reaction; but during this decade arose also a program for national redemption dictated in the hope of actual attainment, and there was one region in which the banner of liberty already waved and where that program was already approaching realization.

This new political policy, as well as that which had sought realization in 1848-49, was headed by Gioberti, who published a book about it in Paris in 1851 with the title 'Upon the Civic Rehabilitation of Italy.' In this work Gioberti, having learned by experience, had destroyed that part of his preceding program which had proved impractical, and had adopted that part of the program of Mazzini which was practical, and presented the new political platform as the special task to be accomplished by the House of Savoy, which alone had demonstrated itself as capable and worthy of performing it; no more any Primate, no more papal supremacy, no more a confederation of princes, but the supremacy of Piedmont, the state to belong to the laity, the abolition of the temporal power of the Pope, unification with Rome as the capital. Such was the program by means of which they accomplished the Italian Revolution from 1859 to 1870 and from which emerged the new free state.

Victor Emanuel II. (1820-1878), King of Sardinia, who succeeded his father after the unfortunate day at Novara, had pledged himself to the statute with a faith which he always kept and which won for him the title 'Re Galantuomo' («The Honest King»); and he dedicated his life to the triumph of liberty and to Italian independence. Reigning thus, with the help of his ministers at the head of whom were Massimo d'Azeglio and that great statesman Camillo Cavour (1810-1861), he laid in Piedmont the foundations of a government absolutely liberal, national and progressive. They offered a generous hospitality to emigrants from all the other Italian states where reaction raged; since all were equal before the law, they abolished the Ecclesiastical Forum; they put through administrative, financial and economic reforms; they stimulated agricultural and industrial production and extended commerce; they reorganized and improved the army because it was obliged to sustain future experiments. The king and the Piedmontese government exerted themselves for the representation of the entire Italian nation; when the war against Russia broke out in the East, the King of Sardinia allied himself with France and England, and the Italian army acquired much glory in the Crimea (1855), thus giving an opportunity and justification to Cavour to speak with authority in the name of Italy in the Congress of Paris with which this war closed. In order to prepare the way for harmony among all the Italians in the coming rehabilitation, the «National Society» was founded in Turin in 1857, and Cavour, since the campaign of 1848-49 had demonstrated that Italy could not act by herself, succeeding in establishing harmonious relations with the Emperor Napoleon III., obtaining from him a promise of help in driving the Austrians out of the peninsula. Victor Emanuel II., in opening a new session of the Subalpine Parliament (10 Jan. 1859) declared that he «was not insensible to the cries of suffering» which were directed towards him from every part of Italy; and a few days afterwards a Treaty of Alliance between France and Piedmont was arranged, which formed a fitting conclusion to a glorious decade and which was to give independence to Italy.

Napoleon III., descending into Piedmont with 110,000 Frenchmen, promised to make Italy free from the Alps to the Adriatic. The Austrians, having crossed the Ticino on April 29, hoped to be able to defeat the Piedmontese before the arrival of their allies and to occupy Turin, but it was not possible. The French and Sardinians together were victorious at Montebello, Palestro, and Magenta; and after that, the conquered enemy having withdrawn towards Mincio, Victor Emanuel II. and Napoleon III. entered Milan triumphantly on June 8. These happy events caused the central Italian states to rise against their respective sovereigns—first Tuscany, then Parma and Piacenza, while Modena and Reggio, and finally Ferrara and Romagna, offered allegiance to the King of Sardinia and accepted commissioners appointed by him. In the meanwhile the war continued, and at Solferino and at San Martino (June 24) the allies were victorious in great battles; but the Emperor Napoleon III. unexpectedly called a halt in the redemption of his promises, and on July 11, for reasons not yet well understood, he concluded an armistice of Villafranca with the enemy, which armistice Victor Emanuel was regretfully forced to accept. By the terms of this armistice, followed in November by the Pact of Zurich, Lombardy was ceded to France, to be transferred to Victor Emanuel, and in central Italy those princes were to return who had been driven out, since the populace demanded their return. But this they no longer desired; therefore, hardly had

the Royal Commissioners departed, when they elected provisional governments which at once set to work to thwart any attempts at return on the part of the abdicated sovereigns. Napoleon was at last convinced that it was not possible to detach from Piedmont those regions which so earnestly wished to be united with her; but he wished a recompense, which was the cession of Savoy and of Nice (24 March 1860), granted in the Treaty of Alliance in exchange for the freedom of Lombardy-Venetia. Henceforth the kingdom of Sardinia included Piedmont, Lombardy, Parma and Piacenza, Modena, Ferrara, Romanga, Tuscany, Liguria and the island from which it takes its name; and this was the beginning of the present kingdom of Italy.

In the kingdom of the two Sicilies Ferdinand II. was succeeded by Francesco II., a son worthy of his father. In the beginning of April 1860 a conspiracy gave rise to a small rebellion in Palermo, followed by other insurrections in various parts of the island. The time seemed opportune to Garibaldi to attempt the liberation of Sicily and of Naples. On May 5 1,000 enthusiastic volunteers set out from the Rock of Quarto near Genoa, under his command and with the good will of the government and the King of Piedmont; they landed at Marsala, where Garibaldi assumed dictatorship in the name of Victor Emanuel II., King of Italy, conquered the Bourbons at Culatafini, entered Palermo after a brief struggle, and, his numbers constantly increasing, had a decisive victory at Milazzo; and in a little more than a month the entire island was free. Henceforth, some small risings discovered here and there opened up the way for him; he landed in Calabria, and almost without a blow, was welcomed as a liberator everywhere. He advanced towards Naples, into which city, preceding his men, he entered almost alone on September 7, the day after King Francesco II. had fled to the Fortress at Gaeta. At this point an event occurred which has been called the masterpiece of Cavour. The governments of Europe were much disturbed by the triumphs of the popular hero Garibaldi, which rendered the Italian Revolution so terrible. Cavour thought that if the secular monarchy of Savoy, which up to this time had only assisted this expedition of Garibaldi's, should boldly assume the direction of it, it would not only add to its prestige in Italy, but would furnish the European powers with such guarantees of order as to render their intervention unnecessary. He decided, therefore, to come to the aid of Garibaldi. Having first traversed and captured from the Pope the Marches and Umbria in the victory of Castelfidario (September 18), the Piedmontese army entered Naples, where Garibaldi and his followers had won the battle of Volturno but had not been able to capture the fortresses which still resisted them, among them Gaeta where the Bourbon king was staying, and which were besieged by the royal army. Victor Emanuel II. and Garibaldi entered together into Naples. A plebiscite of Neapolitans and of Sicilians declared the desire of these regions to be united with the others, as they had been in the former state of Savoy; and Garibaldi, after he had presented the result of this vote to the conquered king, withdrew into his island of Caprera, carrying with him as the rich booty of conquest a sack of straw. In February 1861, the first Parliament of all the regions of Italy was assembled in Turin; on March 17 that law, which declared the *Kingdom of Italy* constitutional was ratified, and on March 27 Rome, still in the possession of the Pope, was boldly proclaimed the capital of the new state.

When Cavour died (6 June 1861), only two provinces were lacking to make Italian unity complete—Venice and Rome—and all were agreed that these should be joined to the mother country. But since the government, following in the footsteps of the great minister, wished to proceed with caution, especially as regarded the question of Rome, in order not to draw down upon the head of the young king the resentment of Catholic Europe, many Italians under the inspiration and guidance of Mazzini and of Garibaldi, formed a so-called party of action, which wished to proceed more rapidly and without so much consideration for foreign susceptibilities. The work of this party was some attempts by Garibaldi to settle the two questions by force of arms; in 1862 the government was obliged to interfere, first, to stop the general at Sarnico, near Bergamo, since with his volunteers he wished to invade those provinces still held by Austria, and then to stop him at Aspromonte in Calabria, since he was advancing to take Rome from the Pope and then intended to march through northern Italy to free Venice. The final arrangements of the Convention of September 1864 between France and Italy were much discussed; by these terms France was obligated to remove from Rome the garrison which had remained there since 1849, and Italy agreed not to attack nor to allow others to attack the Papal State, and also declared her willingness to move the capital of the kingdom from Turin to Florence. This change was made in 1865. In the meantime the liberation of Venetia was approaching, to accomplish which, Italy arranged an alliance with the Kingdom of Prussia, which at this time appeared to be unfriendly towards Austria, her antagonist in Germany. In 1866 the two allies attacked their enemy at the same time, with the intention of entering Vienna to dictate there the terms of peace. But while the Prussians in Bohemia were victorious, the Italians, through mistakes of their leaders, met with two reverses, at Custoza on the land, and as Lissa by sea. So that they were obliged to consent to receive Venetia from Austria on the most humiliating terms and to leave Trentino, Trieste and Istria still in her power.

The liberation of Venice sharpened the need and the desire to also redeem Rome, and Garibaldi and his party of action set to work in the autumn of 1867. Bands of volunteers penetrated the Pontifical State (narrowed down to Lazio by the deeds of 1850-60), and while an insurrection was being arranged in Rome itself, they occupied Monterotondo. The insurrection failed; but notwithstanding, a handful of 70 brave fellows led by the Giovanni brothers and Enrico Cairoli, approached the city as near as the Villa Glori, where they were overcome by the Pontifical troops and killed or captured; and the French having landed at Civitâ-

vecchia, because they insisted on the observation of the Convention of September which had been broken by this unlucky invasion, Garibaldi betook himself to the mountains of Tivoli in order to prolong resistance; but arrived at the basin of Mentana, he was here attacked and defeated (November 3) by the Papal troops and the French. This glorious defeat of the Italians had innumerable consequences, since the entire nation felt that it could not any longer endure that a foreign decree could withhold from them their rightful capital. They prepared, therefore, with zeal and with negotiations for the supreme moment, which was not slow in presenting itself. When the Ecumenical Council of the Vatican in 1870 had proclaimed the dogma of the infallibility of the Pope, and the Franco-Prussian war had caused the downfall of Napoleon III., the Italian government held itself freed of the obligations which it had assumed personally with the emperor through the Convention of September, and it decided to act. First it attempted to induce Pius IX. to open the gates of Rome in a friendly way; upon receiving a refusal of this request, it was decided to use force. An army commanded by General Raffaele Cadorna (20 Sept. 1870), made a breach in the wall near Porta Pia, entered the city, and was warmly welcomed by the population. The Pope made protest and declared himself a prisoner of the Italian Revolution; but on October 2, a plebiscite of Romans consecrated the union of Rome with Italy. The Parliament in Florence in 1871 passed a law guaranteeing the papal security, and thereupon the capital was transferred into the free city without any opposition on the part of the Catholic powers, and Victor Emanuel II. could declare «we are at Rome and there we shall remain.» and Quintino Sella could say «*hic manebimus optime.*» This unification of Italy was the realization of the dream of Dante, of Machiavelli, of Alfieri and of the myriads of martyrs who from 1815 to 1870 sacrificed themselves for their country. Italy had completed one of the most important efforts for liberty and for human progress; and in the years to come she could expect the development of her own resources and consequently that prosperity and that grandeur which had been prohibited for so many centuries.

Period V.—*Development and Progress of Free Italy* (1870-1907).—The various members of the country being brought together in one body, the Political Resurrection was necessarily followed as a natural consequence by an economic, intellectual and social Resurrection. All power after 1870 remained in the hands of that party which had had Cavour as master, and which had had the wisdom to guide Italy to unification. But this party, because of its oligarchial tendencies, lost its majority in Parliament and in the country, and political power passed in 1876 into the hands of the progressive party, which kept it for several years and did many good things, such as the extension of electoral rights, the abolition of the most distasteful taxes, the compulsion of elementary education. Then the Right and Left became mixed and confused and there were no longer distinct parties with different programs. In 1862 occurred the death of Mazzini, who had been the first to preach to the nation its duty to unite; in 1878 Victor Emanuel II. died in Rome, the man who had realized that which Mazzini had thought, and whose sepulchre is the Pantheon. During the reign of Humbert I. (1878-1900) the liberal institutions continued to develop with order and regularity, and socialism, which was spreading throughout the country and sent its representatives to the Chamber of Deputies, was spurred to reform. They passed laws to improve the administrative, judicial and financial regulations; they provided for public hygiene; they protected the rights and the interests of the laboring classes, establishing obligatory insurance against accidents to the operatives, and limiting the hours of labor for women and children, founding a pension bureau for artisans, etc. Two very important events took place during the reign of Humbert I.: the stipulations of the Triple Alliance, and the acquisition of colonies in Africa.

Pius IX. and his successor Leo XIII. did not give up the pretence of still possessing temporal power and threw obstacles of every kind in the way of the reign of the so-called usurpers. In France the republic was not yet upon a firm foundation and might at any time fall into the hands of the clericals, who were in favor of pontifical vindication. To this should be added the occupation of Tunis, made provisionally by France in 1881, which awakened great wrath from there to the Alps. Italy believed herself in danger; and at the same time Austria threatened her from the other side, because she was irritated by the agitations of the Italian party, called the Redemptionists, expecting the speedy liberation of Trentino, Trieste and Istria; they felt the need of relying upon Germany, which was already united with Austria; and thus in 1882 arose the Triple Alliance, which has been repeatedly renewed and has preserved peace throughout Europe. Later, her wrath being appeased, Italy again approached France, and her consequent agreements with this power and with England safeguarded her interests in the Mediterranean.

Her colonial possessions in Africa commenced with the acquisition of Assab in 1882, then with the occupation of Massaua in 1885. Wishing to occupy the high plateaus in Ethiopia, the Italians came into conflict with Emperor John of Abyssinia; but he, after a victory at Dogali in 1887, was forced to withdraw. Some years afterwards, Italy wished to exercise a sort of protectorate over the new Emperor Menelik, because of her occupation of some territory; he refused and war again broke out, and this, after some honorable defeats for the Italians, ended with the disastrous conflicts of Adua and of Abba Garima (1 March 1906.) Thus the dream of a vast African Empire vanished, and Italy was obliged to content herself with a more restricted territory, called Colonia Eritrea, which is being peacefully developed with hopes of a prosperous future. Besides this colony, there have been acquired upon the shores of Eastern Africa the colonies of Somalia (Somaliland) and Bessadir.

The reign of Humbert I. had a tragic ending. In consequence of a serious disagreement

between the ministry of General Luigi Pelloux, who wished to restrict some liberties, and the more advanced party of the Chamber, which defended them, a conflict which became most acute and which at length reached obstructionist tactics and produced great resentment, an Italian anarchist left the United States, in order to revenge upon the irresponsible King the retrogressive attempts of the Minister, and killed Humbert I. at Monza July 29, awakening horror of the murderer and sympathy for the victim throughout the entire world. His young son, Victor Emanuel III., ascended the throne; he had been educated with the greatest care in regard to his exalted position, and he has proved that he respects liberty and is worthy of the esteem and affection of the Italians.

This nation, which has already given two civilizations to the world, when her redemption from foreign oppression and her own unification commenced, could already in certain aspects stand upon equal footing with the most progressive of the civilized nations, but in others she was inferior to all. In fact, even in those centuries of slavery Italy was always the country of science, literature and art; but in those same centuries her economic conditions were deplorable. Liberty not only made it possible for her to preserve those requisites which she already possessed, but also put her in a position to acquire those which she lacked. In science, the national genius which had produced Leonardo da Vinci, Galileo Galilei, Allesandro Volta, and many other distinguished persons, continued to manifest itself; to mention only the principal names, there were the astronomers Angelo Secchi (1818-1878) and Giovanni Schiapparelli (1835——); the great psychologist Cesare Lombroso (1836——), founder of criminal anthropology; the physiologist Angelo Mosso (1846——), inventor of pletismografo and of ergografo, and the electricians Galileo Ferrario (1847-1897), who discovered the rotary magnetic field, and Guglielmo Marconi (1875——), who gave us wireless telegraphy; the philologist Graziadio Ascoli (1829-1907), the chemist Stanislav Cannizzaro (1820——), the mathematicians Eugenio Beltrami (1835-1900), Luigi Cremona (1830-1903) and Giuseppe Veronese (1854——). In letters, the country of Dante, of Petrarch, of Boccaccio, of Machiavelli, of Ariosto, of Tasso, after having seen her redemption assisted by the works of so many famous authors, whom we have already mentioned, having become free could already boast of writers like Giosuè Carducci (1836-1907), Edmondo de Amicis (1846——) and Gabriele d'Annuzio (1862——). In the fine arts, of which Italy had produced for many centuries so many masterpieces, it was difficult to keep herself on the heights to which she had formerly risen and to which so many other countries had arrived. Especially in architecture are there many examples worth mentioning, as regards originality, grandeur and purity of style, for instance,—the Gallery Victor Emanuel in Milan by Giuseppe Mangoni (1827-1887); the National Museum of Italian Renaissance in Turin, called Mole Antonelliana from its author, Alexander Antonelli (1808-1888); the monument to Victor Emanuel in Rome by Giuseppe Sacconi (1854-1905). In painting, we may mention as among the most illustrious, Domenico Morelli (1826-1901), Giacomo Favretto (1849-1897), and Giovanni Segantini (1858-1900). In sculpture those worthy of mention are Giovanni Duprè (1817-1882), Vincenzo Vela (1822-1891), and Giulio Monteverde (1837——). In music, after Rossini, Bellini and Donizzeti, who attained their greatness during the period of struggle for Resurrection, Giuseppe Verdi (1813-1901) continued his admirable productions, and Pietro Mascagni (1863——) commenced to make himself heard of, as well as Ruggero Leoncavallo (1853——), Giacomo Puccini (1858——), and Umberto Giordano (1870——).

More difficult than the preservation of their former importance in the scientific, literary and artistic world, was the beginning of their economic importance. The energy which liberty developed in the inhabitants, especially in the northern parts, and the provisions of the state rendered possible many great public works, destined for the progress of agriculture, of industries and of commerce; for example, the redemption of marshy lands in Ferrara and near Rome; the colossal aqueduct of the Puglie; the tunnels of Cenisio, St. Gottard and the Simplon, which it is intended to follow by those of Spluga and Montebianco (Mont Blanc); the construction of railroads, which now exceed 16,000 kilometres; the regulation of the harbors, among which Genoa bids fair to become the foremost on the Mediterranean. Industries which had never existed before now appear and prosper from day to day; in some lines, for instance in weaving cotton cloth and silk fabrics, in the construction of automobiles, Italy does a large export business. The Alps which surround the peninsula, and the Apennines which traverse it, furnish in their streams cheap and abundant electric power; which will constantly lessen the amount now paid for the importation of coal. Commerce has increased to such an extent that Italy is now the eighth power in the world for exports and the seventh for imports. The country does not yet produce all the wheat which it needs, but agriculture is constantly progressing. The population has risen to 33,000,000, and 4,000,000 Italians work in foreign countries, from whence they contribute their savings to add to the national wealth. If all the regions of the kingdom, in industries, in commerce, in agriculture, in the diffusion of popular education, should arrive at that degree of efficiency to which the northern provinces and a part of central Italy has risen, in less than half a century, Italy would in these aspects also stand on an equality with any of the most progressive nations. What she has been able to accomplish in spite of the enormous difficulties created by her peculiar conditions, was well seen in the International Exposition held in Milan in 1906 to celebrate the opening of the Simplon tunnel, and one will see even better what is being accomplished in Rome and in Turin at the celebration in 1911 of the fiftieth anniversary of the foundation of the Kingdom of Italy and the proclamation of Rome as its capital.

BENIAMINO MANZONE,
Director of the Historical Review of Italian Risorgimento.

7. Italy — Political Administration. *General Characteristics.*—In order to understand the political character of the administration in the kingdom of Italy, we must take into consideration certain essential elements of her constitution, determined by her political history and by the manner of the formation of the Italian kingdom. The reaction against the secular division of Italy into a number of more or less insignificant states, none of them strong and all more or less at enmity with each other, determined the formation of a government that should not only be rigorously unified, but absolutely concentrated. There should be not only one source of sovereign power, but also the greatest possible concentration of power in the central authority. Thus the original type of Italian administration was moulded to a perfect similarity to that of France before Napoleon. Meanwhile, the broadly liberal spirit in which the Italian constitution was applied and interpreted, and the domination of democratic influences, rapidly led to a full and absolute adoption of the parliamentary system, by which the cabinet is responsible in parliament for the acts of the Crown, and the parliament exercises a direct and constant influence on the proceedings of the public administration, either in virtue of the ever-widening and increasing scope of its legislative functions, of the annual acceptance of the budget, or of what, strictly speaking, may be called the inspectional function (*interrogazione, interpellanza ed inchiesta*) and the power of censuring the cabinet and instigating dismissal from office.

In a unified and concentrated government, which is at the same time a parliamentary government, and as such subject to the rule of the majority or of parties, the influence of politics with all its menaces and all its perils on public administration, seemed almost inevitable. The Italian government is certainly not free from this accusation. But the gravity of these dangers was fully foreseen, and determined a reform government with the view of avoiding or diminishing them. Corresponding to this was an ulterior phase of administrative development in the Italian government which, in the field of science, encountered the influence of the German theories on the jurisdiction of government and on the judicial auto-limitation of the powers of the State as a guarantee not alone of political, but also of the civil rights of the individual. Thus, while according to the statute the right of appointing or removing officials belongs to the head of the executive, successive rulings gradually limited this power so as to make it little more than a formality and subordinate it to a multiplicity of limitations and privileges; thus the discretional powers of the public administration were regulated and disciplined with great strictness; thus a series of very severe inspections in administrative laws, judicial ordinances, and parliamentary ordinances. Perhaps, taken altogether, the government of Italy has to fear the dangers of weakness rather than those of violence and absolutism. The truth is that Italy has had too brief an education in the hard school of freedom; she is still passing through periods of transition, and has not yet conquered all the phases in the perfect formation of an administrative organization.

Direct Administration of the Government.—The outward and formal affirmation of the unity of the administration is in the head of the kingdom. According to Art. 5 of the Statutes of the Kingdom, «To the King alone belongs the executive power.» Art. 5 affirms further that the King is the supreme head of the State, commands all the forces on land and sea, declares war, and has control of the foreign policy of the kingdom. The king makes appointments to all the offices of the government and makes the decrees and ordinances for the execution of the laws (Art. 6, Stat.).

With the parliamentary form, however, of the Italian government all these prerogatives of the King are always exercised subject to the responsibility of the Ministry, either collectively (the cabinet), or individually according to the nature of the act.

The responsible representatives of the government are therefore the Ministry; and in Italy they have a double function: constitutional on the one hand, in which they assume the responsibility of the acts of the Crown before the parliament; administrative on the other hand when they take the active direction of an important branch of public administration. There are 11 branches of the Ministry in the Italian government: (1) The Ministry of the Interior, which is really the political ministry par excellence (on it are dependent the departments of police and of public sanitation, the local government offices, the communal administrations, the prisons, etc.); (2) the Ministry of Foreign Affairs; (3) the Ministry of War; (4) the Ministry of the Navy; (5) the Ministry of Public Finance; (6) the Ministry of the Exchequer (which administers the wealth of the kingdom and represents the financial economy of the government); (7) the Ministry of Justice and Religion (which is supreme in all jurisdictionary and ecclesiastical matters). Then come the departments of social administration: (8) the Ministry of Agriculture, Industry and Commerce; (9) the Ministry of Public Works (which comprises also transportation and railroads); (10) the Ministry of Public Instruction; (11) the Ministry of Postal Communication and Telegraphs. The supreme organ in the councils of the government, intended to give advice to the Ministers, without, however, limiting their freedom or responsibility, is the Council of State, besides the special supreme councils which are instituted in the various Ministries for the discussion of special matters.

The direct administration of the government—emanating from the ministerial centre—is felt throughout the whole territory of the kingdom by means of a network of local government officials, co-ordinate and subordinate. Every special administration has, naturally, its special territorial organs; but even in this diffusion of the administrative action it has been the object to maintain a sort of subcentral unity, by the institution of a suitable official who should represent all the powers of the government within a certain extent of territory. This office is filled by a Prefect, within a circumscribed area known as a province; the kingdom is divided into 69 prefectures.

The Prefect, according to Art. 3 of the Communal Law, represents the executive power in the whole province, provides for the execution of the laws, supervises the conduct of all the public government offices, superintends the safety of the public, has the power to make use of the police force, and to call out the soldiery. Thus, all the provincial government officials find their unit of co-ordination in the Prefect, who upholds and confirms their subordination to the managing official of the Ministry. The judicial representation of the central administration is also assured in even the smallest section of territory, for in every commune the Mayor (besides being the head of the communal administration, as we have said) is also empowered to represent the government, especially in whatever regards public safety, the police department, and local sanitation.

The Administrative Departments and Public Offices.—The unification of the Italian administration is specially shown in the bureaucratic and departmental organization. All the offices of the government are united by a chain of obedience which mounts gradually from the lowest to the highest, from the local to the central government, up to the supreme Head of the Administration, *i. e. the King*. The administration, except in certain very exceptional cases, is bureaucratic, *i. e.* consists in paid individual responsibility of public functionaries who are at the same time professional employes. In Italy there is no general law on the judicial status of employes. There are, however, several special laws and a lengthy and complex series of special regulations, forming, as one may say, a species of common law regarding public employment. The appointment of public employes is generally through competitive examination, and in this way the various grades do not depend on the arbitrary whim of their superiors. The exceptions to this rule are in the case only of certain official positions that are pre-eminently political, and especially that of prefect.

Local Administration.—The antecedent history of the Italian government gave rise from the first to a spirit of mistrust of the local autonomies, ill concealed by purely external and formal recognition of an auto-administration to a great extent democratic. This led to the breaking down of all connection with those great natural divisions of territory which in Italy were formed by regions many of which had a real and true geographical autonomy (such as the large islands of Sicily and Sardinia), and others a parallel in antecedent history, in the usages, customs, dialect (as in the ancient kingdom of Naples, in Tuscany, Piedmont, etc.). The whole territory of the kingdom was instead divided symmetrically into communes which were given a uniform government, without any juridical recognition of the difference between large cities and small communes, between industrial and rural centres, etc. An aggregation of communes constituted a province (which is at the same time the circumscribed section under the local authority of the Prefecture, as has been previously mentioned). There are 69 provinces, and the average population of each of these amounts to about 500,000 inhabitants, but in actual fact the number and density is variable. Only occasionally the province is identical with the region (for example, Umbria and Basilicata); in general, every region comprises several provinces (Sicily, seven; Sardinia, two; Tuscany, eight; Piedmont, four, etc.).

Thus the communes which the provinces may juridically retain as self-governing bodies are territorial corporations of which the government makes use as organs of its administration; while, at the same time, they represent and take charge of the collective interests of the corporation itself. It follows that these corporations, as far as their activity in the field of public administration is concerned, have never any original rights of their own, but act in virtue of a delegated legislative authority, and use the powers transmitted to them by the government.

The legal limit of their autonomy is found in the normal functions of vigilance and control which the government (through the instrumentality of the Prefectures and the Ministry of the Interior) exercises over the local bodies, reserving to itself the right of annulling in these communities such enactments as might prove contrary to the laws and outside the limits of their right (*competenza*). By certain enactments (but not as a law), the government exercises a real guardianship over the communal administrations, looking into their very actions with the consideration of their expediency and utility. The organ of this guardianship is a college of seven members, partly honorary, partly official functionaries, called the Giunta provinciale administrativa (Provincial Administrative Assembly).

The communes and the provinces, according to a general law, do not exercise any of the activities of political organizations, but only the economic and social institutions, particularly transportation, public instruction, hygiene, and local police, and the assistance of the poor. Some of these services are made obligatory on them by law; others may or may not be instituted at discretion. An insuperable obstacle to this theoretical liberty is doubtless, however, the lack of financial means. The local Italian administrations have no true and individual financial autonomy: the principal income from taxes are the exclusive appurtenance of the government, which leaves to the communes only a quota of the amount within certain limits. A recent law (1903) permits the communes to assume the direct management of commercial or industrial enterprises that have a bearing on public interests and constitute to a certain extent natural monopolies (aqueducts, public and private lighting, tramways, telephones, mills and furnaces, public baths, etc.).

As regards the constitution of the communal representative bodies, the Italian law is sufficiently comprehensive and democratic. In all communes there is a deliberative body which sets forth the will of the community in matters of serious importance, and the communal council (in the provinces, the provincial council) composed of a number of citizens (from 80 to 15, according to the population of the commune) nominated by the popular vote of the majority. All citizens are entitled to vote if they pay into the commune any

kind of legal tax, provided they know how to read and write, and those who, having their domicile in the commune, shall be absolved from the obligation of elementary instruction. As a rule no direct interference by the assembly or by popular vote was permitted in the management of communal affairs; but, lately, the law on the municipalization of the public utilities insisted that the deliberations of the communal council which resolved to assume the service should be put to the vote of the electors of the communes (referendum).

The Mayor is the head of the communal government and the organ of its active administration. He has, at the same time, as above mentioned, the dignity of a functionary of the central government. In spite of this complex position, his appointment is entrusted to the communal council, who elect him from among their number. The Governor has the power to recall him from office as he has also the prerogative of selecting the communal council and to place the administration of affairs in the hands of a commission in extraordinary until the next election and for a period not exceeding six months. The Mayor is assisted in the exercise of his official functions by a body (*Guinta*) of lawyers (assessors) elected also by the communal council. The provincial council elects a provincial deputation which, with its president, is the organ of the active administration of the province itself.

Jurisdictionary Inspection.—Besides the parliamentary jurisdiction over the entire administration of the kingdom of which mention was made (notably the practical drawing up of the obligatory balancing of expenses and the sum allowed by the government, which is controlled by the Corte dei Conti), Italian public law has ordained a series of mutual inspection (*controlli contenziosi*), and yet strictly jurisdictional.

The law of 1865 gives to the ordinary tribunals the power to reinstate in his rights the citizen who has been wronged by an act of the public administration, abolishing the ancient government courts of *controlli contenziosi*, which formerly existed, modeled on those of France. This full judicial power is, however, subordinated to two conditions: that a true and inherent subjective right of the citizen should have been infringed; that the sentence should be limited to the recognition of the wrong suffered in the specific case, without the ability to revoke in itself the administrative act. Thus much in regard to the theory of the distinction between powers, which, although it has been discussed and is capable of discussion in the abstract, remains one of the positive accepted unwritten laws of the Italian constitution. To offset the lack of protection of the legal sphere of individual interests caused by these limitations, a law of 1888 established a high tribunal of administrative justice (creating special section of the government council) which, with all the forms and guarantees of legal procedure in *contradictorio*, adjudicates on the objective legality of the acts and provisions of the administration, it being sufficient that the citizen should prove that not necessarily a law, but a legal privilege has been impaired by this act. The council of the government in the seal of administrative justice has the privilege of annulling the impugned administrative decree. For the settlement of disputes that may arise between the government authority and the judicial authority, the supreme tribunal is the highest court in the kingdom—the Court of Cassation in Rome.

Victor Emanuele Orlando,
Minister of Justice of the Kingdom; Professor of Common Law, Royal University of Rome.

8. Italy — Crown and Parliament. The nature of the relations between the ruler or head of the State and the Parliament is the best guide in determining the character of a representative government. These relations are harmonious in the constitutional systems of Prussia, and of the German Empire; inharmonious in the republics; distinctive in England, Belgium, and Italy.

The note of discord is formed by the Cabinet, when that Cabinet represents the intermediary between the ruler, or head, and the parliament. From the historical point of view representative governments which have been formed through royal concessions recognize in their statutes the predominating influence of the sovereign, who is the centre of gravity of the State; and although these Parliaments have distinct power they yet consider him the head who inspires them and ordains their powers and the limitations of those powers. But this can only be a transitory state of affairs. Liberties, though they have the appearance of concessions, are no longer revocable; the suffrage is being gradually extended, and the influence of the popular assembly on the action of the government is ever on the increase. There may be a more or less prolonged period of resistance on the part of the Crown, but parliamentary government expressing the will of the people, will finally triumph over the constitutional form.

THE CROWN.

This brief general statement will aid us in understanding the origin, the historical and constitutional value of the Crown, in its relation to the character, and to the proceedings of the parliament in Italy. We can then, in bolder lines, portray a double period which corresponds to the gradual development of our political organization. This political organization in its dynastic concessions resembles a charter; as regards its title, its form, it is a statute, as regards the spirit that prompts it, the manner in which it has evolved, it is a true constitution on a parliamentary basis. In its outward and superficial appearance it differs little from other statutes in which, as in Prussia, the ruler of the State is the Head of the Executive.

In Italy the statute has not the restrictive authority that it had in France in 1814, in Prussia in 1850, in Austria in 1867, all of which represented royal concessions; and yet it still suggests the old abolutism in many particulars. To the Italian statute, as regards jurisdiction, the same standard cannot be applied that political science suggests in the examination of other constitutions. A scientific analysis will show that a statute conceded by royal initiative must have a special character. The King thought

that by creating the organization necessary for political government he would restrict his own power; but he really in this way ordained that such matters as referred to the exercise of power or freedom should be regulated by law.

This complication of regulations, restrictions, of written (codified) principles form a series of limitations that the Head of the State has placed on his own actions, and which is analogous to the restrictions which the executive lays down by decree and ordinance. Without this we could not explain the provisions which do not come under the ordinary classification of the three forms of government. We will merely cite the various forms of the *Jus Imperii* which daily become more comprehensive, and avoid the civic as they do the legal authority. These provisions, which assumed the form of royal decrees, represented the exercise of the highest sovereignty, and had some analogy with the orders of the Privy-Council in England; but on the other hand they must not be confounded with the royal enactments, such as those permitted by the charter of 1814 in France, which cost Charles X. his throne and overthrew the Polignac ministry, or with that which authorized the decree of May 1882, in Prussia.

It would be natural in Italy to expect a similarly enlarged sphere of royal authority which would appear to detract from the reality of parliamentary government. And in the preliminary period of our constitutional history we have not a few instances of such a condition of affairs. But through the natural evolution of parliamentary government the rights immediately belonging to the Crown were preserved, and all the rest were included in the responsibilities of a ministry directly responsible to a House of Deputies elected by the people.

The manner of procedure in the Law of Necessity, which comes up in extreme cases before any government, whether monarchist or republican, has not been clearly defined. The proclamation of a state of siege depends, in substance as well as form, on a royal decree which, although countersigned by all the members of the Cabinet, does not guarantee it from possible abuses. While preserving to the Executive the right of action by means of decrees, the limits of such a Law of Necessity should be fixed by means of laws, such as they have in France and Germany; or better still, by the English method, which requires the intervention of parliament.

The Italian Statutes contain various dispositions in regard to the prerogative of the Crown, namely, the mass of guarantees ordained to maintain the prestige of the Crown and its preeminence over a representative government, such as: the hereditary character of the Crown according to the Galic law (art. 2); the inviolability of the person of the king (art. 4); fixing his majority at 18 years of age (art. 11); the allowance to the members of the royal household; the regency, etc.

The royal income, the successive increment to which, accruing from the annexation of the various Italian States to the old kingdom of Piedmont, in regard to which there were about seven laws on the Civil List, from 16 March 1850 to 31 May 1877, besides the last one decreed by King Humbert, corresponds almost to the permanent government expenses in England, and is free from parliamentary control. Its administration is autonomous and preludes all interference by either chamber.

The minister of the royal household, according to the decree of 14 Nov. 1901, is nominated by the suggestion of the Council of Ministers, but has no responsibility towards the Parliament. The prerogatives constitute the traditional element, whose precedents extend far back in the limited monarchy, as in the absolute. But there is another element—impersonal and non-statutory, but with a political significance and history connected with the State and with modern society. This is the most difficult matter the Crown has to contend with because it is relative to its *raison d'être* with regard to the democracy.

The Crown in Italy resumes all the chief characteristics of the Parliamentary Monarchy. Hence, in spite of diversities of origin, of customs and traditions, it resembles by analogy those of England and Belgium. A more profound observation of the acts and functions of the King has established the fact that a Parliamentary Monarchy, will find its *raison d'être* in an elective principle, although the form be hereditary. History gives instances of this. The transition from the Constitutional to the Parliamentary form was determined in England in 1688 by solemn Act of Parliament which deposed James II. and put in his place William of Orange.

In Belgium the new monarchy arose by elective act of parliament, after having obtained a separation from France, and proclaimed a Constitution in 1831.

In France the Crown underwent a profound transformation which distinguished the declaration of 1814 from that of 1830, when the Parliament proclaimed Louis Philippe King of the French. The same character was seen in the dynasty of the Second Empire: Louis Napoleon was elected Emperor in 1852, and called a plebiscite in 1869.

The Crown in Italy has a special hereditary character through its historical traditions, but in virtue of the annexations, and of the plebiscites has been invested with an elective character, which is reflected in its actions; whence the constant and effectual support which it has given to the democratic evolution of the Italian constitution. Within the limits of the Constitution the King, free from all restrictions, has the right to ameliorate the various organizations of the State. This is shown by the foreign policy: the authority to form alliances, to enter into agreements with foreign nations, to form a government, to renew the parliament, to convoke the assembly.

These eminent prerogatives are distinct from the functions that the King exercises with the co-operation of the other functionaries of the government, which may be called co-operative functions:

(1) Co-operation with the legislative power in regard to the royal decree for the presentation of all the laws projected by the Ministry, and to the sanction of those laws; for once they are voted on by the Chamber and the Senate, they become law. In theory the King's veto is absolute, but its peremptory character does not

hinder the passage of a law, in fact this right has never been exercised. The method of veto granted to the President of the United States answers the purpose better, and has a beneficial influence in allowing time for the amendment of many important laws. It would be advisable to introduce it in Italy where the lack of a mixed commission prevents any means of adjusting the want of unanimity in the two Chambers, and thus leads to an acquiescence which is harmful to the efficiency of the laws.

(2) Co-operation with the executive power in the nomination to all the offices of State, which presupposes always a preference designated by the government, which is responsible for its nominee. This series of mutual relations does not include (at least in form) the initiative of the King even in making those nominations which seem to pertain exclusively to his prerogative, for instance, the nomination of Senators. This, properly speaking, is his special right, in regard to the members of the government, and has also to be subscribed by responsible ministers.

(3) Co-operation with the judiciary in whatever else belongs to the power of nomination; the power of pardon and of amnesty.

The distinctive feature in a parliamentary monarchy was constituted in Italy by the Cabinet, the choice of whose members depends on the free will of the King. According to the letter of the Statute this privilege is absolute (art. 67); but in practice it has been modified to suit the conditions of Parliament and the country, in accordance with the best traditions of England and Belgium.

In the preliminary period, from 1848-1860, the King had a greater power of initiative. His prerogatives savored of the original character of the Statute which was a concession by the Crown; and the exercise of those prerogatives was a complete success, especially in the choice of the Prime Minister, Count Camillo Benso di Cavour, who directed Italian politics and their functions, seconded by King Victor Emmanuel II., which led to the independence and unity of Italy. With the new kingdom, the national representation became of more value, the selection of the Cabinet was made the choice of a majority, and depended on the political votes of the Chamber of Deputies. This proper method has been followed until the present time, by the King, who thus maintains himself superior to all parties, and can adapt himself to the exigencies of public opinion.

In the exercise of the right of choosing the members of the government, is also comprehended the power to refuse any such nominees if the Crown thinks that the legal majority in Parliament does not correspond to the royal majority throughout the country. Thus it happened that in 1864, after the sad cases in Turin, which provoked a violent repression on the part of Minister Minghetti, subsequent to the Convention of September, at which the capital was transferred from Turin to Florence, the King demanded the dismissal of the Cabinet, although it had a majority in the Parliament.

In several cases the Crown has not been willing to accept the retirements caused by hostile votes in the Chamber of Deputies, but it is a right which must be exercised with discretion, and it is always connected with the power of appeal to the country.

Collecting together the various solutions of the crises during a period of 58 years it will be found that the Crown exercised greater freedom in the choice of ministers under Charles Albert and Victor Emmanuel II.; that in many instances it used the power of discretion under King Humbert, and that it conforms strictly to the designation of a parliamentary monarchy under the present government.

THE PARLIAMENT.

Although the Parliament with its two Chambers, in its construction resembles that of France in 1830, it is different from it in its evolution of more liberal customs.

The Chamber of Deputies, composed of 508 members, begun on a restricted electoral basis, acquired a democratic character after the reform of 1882, which established a limited membership, with the requisite of elementary education. This reform still has an influence on the formation of the parties. From the first these took the name of Right and Left; the former, the party of order, had the predominance until 1876, and endeavored to bring about national unity and to establish financial equilibrium, and to proclaim the secular attitude towards the papacy; the latter, as the party of action, endeavored above all to promote the more democratic tendencies and to improve the economic condition of the country. But these two parties subsequently became subdivided into groups which made the formation of a cabinet of harmonious members very difficult, particularly when, in latter times, a strong group of socialists entered the Cabinet, in 1900.

The Upper Chamber, although founded on a basis of life tenure, consists largely of high officials. It has always maintained a liberal attitude; and even if it has sometimes opposed administrative reforms it has never attacked more important political reforms. This connection between the two branches of the Parliament has usually helped to decidedly modify many provisions of the Senate.

The Senate, compared with the other Chamber, has more restricted attributes in regard to finance, although in practice it has several times exercised the power of amendment. It retains special judicial functions as ancient traditional survival of preceding statutes. It may in fact constitute itself a high court of justice for the consideration of cases of Ministers accused by the other Chamber, and also for cases of political crime and where its own members are accused (Statute, art. 36). It may accept in the first case the special judicial function (which is paralleled in the American Senate in regard to impeachment of the President, but it cannot be justified in the other two cases, which savor of privileges. With this exception the two branches of Parliament have identical rights in the exercise of the legal function; in the simultaneity of convocation, and in the closing of their sessions, which depends on the will of the King.

But there is a notable difference as regards the very existence of these two branches of parliament which is shown in the nomination of Senators and the dissolution of the Chamber.

The Italian Statute (art. 33) in the organiza-

tion of the Upper Chamber requires as members those holding the most important positions in the public service and in social life. This characteristic feature gives to life membership a different stamp from that of the French Charter of 1830 from that of Prussia, in 1859, and from every other monarchical charter.

The 21 categories, in fact, constitute a true representation, with a species of gradual selective choice, because it presupposes grades in membership. The standard of nomination adopted by the Crown has followed the democratic evolution of modern society, admitting as members of the Upper Chamber even those who give expression to advanced views. On the other hand, the Senate has understood its position towards the extension of the suffrage through the composition of the Upper Chamber. With remarkable instances of initiative it has more than once even attempted to reform its own organization, introducing the elective element as a primordial basis.

This ingenious system elaborated in the Sared's report in 1894, shows how the Senate has understood the spirit of the times. It has, besides, on many occasions, stretched the exercise of its power of approval to the point of disapproving the nomination of certain Senators, according to a standard which seemed exaggerated to some minds. With the organic decree of 14 Nov. 1901, the Minister declared explicitly his right to propose the nominees for Senator; but if he thus fulfils his ministerial responsibility, it does not lessen the supreme authority of the Senate, exercised by virtue of a constitutional function, and which contains an exclusive right to decide in regard to the merits of its members (Statute, art. 60).

Not less to be considered is the royal prerogative in regard to the choice of the Chamber of Deputies. On its right exercise depends largely wise development, or disorder in public affairs. The Statute places no limitations on him except in the request that Parliament be reconvoked within four months.

No statutory limitation exists to this high prerogative which, except in Norway, holds in all constitutional monarchies; and among the republics is recognized only in France, tempered by the previous assent of the Senate.

In the lack of regulations the experience and the wise judgment of the sovereign contributed largely in Italy to the right use of the Statute. There are certain special conditions that practice has shown may determine the necessity and the occasion for a selection.

1. When there is continued dissension in regard to high matters of State; as occurred on the occasion of the treaty between Piedmont and Austria with the celebrated Edict of Moncalieri, in 1840.

2. When a serious conflict takes place between the two branches of Parliament, and the King has not been able, or has not thought of settling it by renewing the Upper Chamber, augmenting the number of Senators to assure a government majority. This is what King Humbert did in 1880, calling the assembly to decide on the flour tax, which the chamber wished to abolish, and the Senate intended to retain (1880).

3. When the chamber and the government had not fixed standards of general political rights it became necessary to take a popular vote to avoid more serious disturbance (1904).

4. When the new Cabinet had not obtained explicit approval, or results did not clearly show a majority of votes, on account of many absent votes (1892).

5. When through internal disturbances, notwithstanding the established majority, parliamentary business was impeded, as in 1900, when obstructionists paralyzed the work of the assembly.

6. When some grave event occurs which modifies the territory of the country, as in the occupation of Venice and Rome, which gave rise to an election in the Chamber on 13 Feb. 1867, and on 2 Nov. 1870.

7. When a new electoral law is voted. In this way the Chamber was elected in 1882 after the reforms. But it was not thought necessary to re-elect it in 1891, after the law which substituted *viva voce* nominations for nominations by ballot.

From this short exposition it is seen how in Italy the Crown, while preserving its high dynastic prerogatives has from the beginning followed such a liberal policy as to render monarchy compatible with a wise democracy. The co-operation in the national re-organization, the common struggle for independence and unity, and the plebiscites have consolidated this union between the Crown and the Parliament.

The Statute and political science may define the outlines, indicate the forms, but the rest must be governed by good customs which are the true guarantee of free institutions. Italy can boast of a parliamentary monarchy which will bear comparison with the correct traditions of England.

On its side the Parliament, following the trend of the times, has, without shocks or excesses, adapted its constitution to modern needs.

Thus, with harmony established between the powers of the government, and political forms adjusted, Italy may proceed serenely on the path of social reform.

GIORGIO ARCOLEO,

Professor in Ordinary of Constitutional Law, of Comparative Public Law, Royal University of Naples; Grand Official of the Italian Crown; ex-Deputy in Parliament for six legislatures, now Senator for life of the Kingdom.

9. Italy—Communal and Provincial Administration. *Local Government.*—The local government in Italy is administered partly by bureaucratic functionaries appointed by the central government, and partly by independent civic corporations under the administration of officials elected by the people Many of the public services have in various portions of the kingdom special administrative officials. Thus, Justice, the Army and the Navy, the administration of the mercantile marine (heads of departments and maritime regions, and commanders of the port); the ministry of industry and agriculture (inspectors of industry, of mines, and forests); postal communication, telegraphs and telephones (departmental and local administration); higher and secondary instruction (universities, schools); finance (sub-treasurers). The greater number

of the local services that are under government control are administered by prefects and sub-prefects. There is a prefect, a political and administrative magistrate appointed and paid by the government, in every province. There are 69 provinces. This magistrate is assisted in the administration of the various services by other functionaries and by various colleagues.

Above all he is assisted by counsellors of the prefecture, who individually administer some of the various branches of the service, such as the superintendence of the communes, the provinces and the charitable foundations, the public works, principally on the rivers (when there are not special companies for the purpose, called partnerships), and on the government roads, the prisons, etc. The counsellors of the Prefecture, three in number, constitute a council (the Council of the Prefecture), which gives advice to the Prefect on affairs of importance, and audits the accounts of the communes. In the superintendence of the communes and the provinces, the Prefect is assisted by the provincial administrative «Giunta,» a body presided over by the Prefect, consisting of two counsellors of the prefecture (besides a supplementary), and four other members (two supplementary) elected by the provincial council. The provincial «Giunta» is empowered to approve the most important acts of the communes and of the provinces. Five members of the «Giunta» constitute a tribunal for the consideration of various administrative questions with appeal to Division IV. and V. of the Council-of-State. There is a Provincial Benevolent Committee to superintend the charitable foundations. In the department of elementary and secondary instruction, the Prefect is assisted by a superintendent of instruction and a school provincial council. Public hygiene is under the superintendence of a provincial physician and veterinary, and a provincial sanitary council. In forestry there is a provincial council of forestry.

The police department is also under the direction of the Prefect; it has many representatives throughout the province according to the needs, police commissioners, sub-commissioners, delegates, and the regular police.

There is a sub-prefect, a functionary paid and appointed by the government, in every region or district. The regions and districts number 284. The sub-prefect has the same duties as the prefect, especially as regards the police.

The mayor of each commune acts as a government official in matters of general concern; he is dependent in this capacity on the Prefect and Ministry. In the small communes in the same way the mayor is head of the police.

The communes and provinces are independent public organizations under the administration of elected officials.

Italy is divided into 8,277 communes; some of these are large cities; others, little rural communes. All are civic corporations, organized uniformly according to the general law (Provincial and Communal Law of 4 May 1898, with various subsequent amendments). Latterly there has been manifested a tendency to establish special regulations, financial rules, according to the various character and needs of the communes (Laws for the Southern provinces and the Islands, 1 July 1906). The affairs of every commune are administered by a Communal Council, a «Giunta,» and a mayor. The Communal Council consists of a number of counsellors varying from 80 to 15, according to the population of the commune. The counsellors are elected by the electors of the commune. There are four general requisites in order to be entitled to vote: Italian citizenship; an age qualification of 21 years; capacity to read and write; and that the citizen be of the male sex. There is, besides, a special requisite, which is that the candidate citizen shall either be a political voter in the commune (and all that is necessary for that is to have passed the elementary examination of the third class), to have been a resident for one year and to have paid five lire of legal communal taxes, or to have rented real estate with an assessment in proportion to the population. The election of members of the Communal Council takes place every two years, when a third of the counsellors are elected. Each counsellor remains in office six years (Law of 11 Feb. 1904). The election is on a single ticket which is voted on throughout the commune. The representations of the minority is assured by the fact that each elector is prohibited from inscribing on the ticket more than four-fifths of the names of the candidates for lection. The vote is a secret one. All the electors are eligible for the position of Communal Counsellor except in some cases of incompatability. The Communal Council meets twice a year in ordinary session; and in extraordinary session whenever it is necessary to do so. The power of deliberating on the interests of the Commune belongs exclusively to the Communal Council. It decides on the regulation of local police, of hygiene, building permits, determines within the limits of the law the communal taxes, goes over the expense bills, approves the annual budget, nominates and licenses employes, and administers the wealth of the commune. The Communal «Giunta» is composed of a number of members, varying from ten to two (besides two to four supplementaries) according to the population of the commune. The members of the «Giunta» are elected by the council, and chosen from among the counsellors. They are all elected anew every four years. The «Giunta» prepares the matters of deliberation for the Council and itself deliberates on matters of secondary importance. It may, in case of urgency, deliberate on matters belonging to the Council; but these deliberations must be submitted to the Council for ratification at its first meeting. The mayor is elected by the Communal Council, and chosen from among its members. He takes an oath of loyalty to the constitution. He may be recalled by the Council, suspended from office by the prefect, and removed by royal decree. The mayor presides over and convokes the «Giunta» and the Council, and carries their deliberations into execution, makes stipulations for contracts, represents the commune in law, supervises the communal force of employes. In case of urgency, he may issue regulations in regard to public safety in matters of hygiene or building permits, which can be put into force at once.

In every commune there must be at least one paid administrative official, the secretary of

the commune. There may be other paid officials, according to the importance of the commune (Law of 7 May 1902). The action of the communal authorities is submitted to the control of the government authorities. All the deliberations of the Communal Council and «Giunta» are submitted to the Prefect or subprefect. The prefect may annul them if they are contrary to the laws. The more important deliberations, such as regulations, deliberations in regard to taxes, mortgages, contracts binding the commune for over five years, the acquisition of real estate, and, in many cases the budget, etc., must be approved by the administrative provincial «Giunta,» which has the power to approve and make them legal. Some other special matters concerning education and public health must be approved by the Provincial School Council, or the Council on Sanitation. If the communal authorities neglect to take action, or to make provision for obligatory services, the Provincial «Giunta» (and in some cases the prefect) may take action in the matter. In grave matters of public order, or in serious disturbances in the administration, the Communal Council may be dissolved by the Central Government. The communal affairs in that case are administered by a commissioner extraordinary appointed by the government. He cannot remain in office longer than six months. At the end of this time a new council is elected. The communal services are obligatory, or optional. They are obligatory when they are established by the law; the rest are optional. The communes in which the taxes on land and buildings exceed the legal rate, of which we will speak later, cannot have optional services. The principal obligatory services are as follows: The most important is elementary education; every commune must have at least one elementary school with one teacher, and it is bound to have schools and teachers in greater number in proportion to the population, so that all may receive obligatory education (Law of 13 Nov. 1859, 15 July 1877, 21 Oct. 1903, 8 July 1904). The expenses of elementary education, 1899, were 65,000,000 lire; in 1904, 80,000,000 lire. About 10,000,000 lire was contributed by the government. The number of schools is 53,259; the number of students 2,548,583. In relation to the population the proportion is 7.79 to every 100 inhabitants. Another important service is that of public health. Every commune must have a physician and a midwife paid by it for the gratuitous care of the poor. It must, if possible, pay another physician appointed by the government (or sanitary inspector) to supervise hygienic conditions. A commune may be obliged to employ a veterinary surgeon. Every commune must be furnished with drinking water, and have a cemetery (Law of 22 Dec. 1888, 26 June 1902, 25 Feb. 1904).

The service of local police comprises lighting, prevention of fires, superintendence of street traffic, etc. The expenses of public health and police in 1899 were 92,647,975 lire. The service of roads and highways includes the communal streets, their construction and maintenance. Expenses for roads and public works in 1899 were 76,727,335 lire. The service of beneficence comprises, in the communes, the obligation to bear the expense of the sick poor taken to the hospitals; to aid, with the provinces, in the expense of caring for foundlings; and with other societies in providing for those who are unable to work. Besides this, the hospitals and other charitable foundations take a share in public beneficence (Law of 17 July 1890; 30 June 1889). The communes must also provide for the needs of private individuals by the municipal services, such as the manufacture of gas, of electricity, the distribution of drinking water to the houses, tramways, etc. The municipal plants of these industries must be approved by referendum (Law of 29 March 1903). The total expenses of the communes in 1899 were 545,037,954 lire. The total debt in 1900 was 1,237,404,808 lire.

The revenue of the communes come in great part from the rents of real estate, from capital and industry (50,734,403 lire in 1899). The rest is obtained from taxes. The principal are the following:

On funded property (land and buildings) the several communes may lay a tax as high as 50 per cent. of that owing to the State (Government tax). In exceptional instances this limit may be surpassed. (Excess of taxation in 1899 was 134,049,046 lire.) There is the indirect tax on consumption (excise tax); on food stuffs (except bread and flour); and other articles of necessity and luxury (Law of 15 April 1897; 14 July 1898; 23 Jan. 1902). The excise tax of 1899 was 158,774,488 lire. An income tax may be established on the revenue of each family, which is slightly progressive. The family income tax in 1899 was 20,944,482 lire. The personal revenues which are partially liable to this tax are assessed only in the way of two other taxes—on professional income (taxes on purchase and sale in 1899 were 6,069,466 lire), and on cattle (in 1899, 15,248,018 lire). There are a few other local taxes of minor importance. The communes have the selection between these taxes, but they must observe a certain order and a certain proportion between them; they cannot impose any other taxes. The communes may unite in associations (*consorzi*) to deal with their expenses and to provide for some branches of the services (schools, streets, physicians, industrial plants, etc.).

Every province has a provincial council, a provincial deputation and a president of the same. The provincial council is composed of a number of members varying from 60 to 20, according to the population. The counsellors are elected by the voters of the province. The voters of the separate communes are the electors of the province. All those voters who have their domicile in the province, or pay their taxes there, are eligible as provincial counsellors. The election is by separate colleges or districts. Each college nominates from one to five counsellors, according to population.

The provincial deputation consists of a number of members—from ten to six, according to the population of the province. These are elected by the council, are chosen from among the counsellors, and hold office four years. The deputation is charged with the preparatory work, the same as the Communal «Giunta.» The president of the deputation is elected by the Council from

among the counsellors. The Provincial Council may also be dissolved by the government in certain important events; the provincial affairs are then administered for not more than six months by a commissioner extraordinary.

The principal obligatory services which belong to the provinces are the roads and other important public works throughout the province; the expenses of beneficence in the maintenance of lunatics and the erection of lunatic asylums (Law of 14 Feb. 1904); the contributing toward the expenses of the care of foundlings; certain services and expenses connected with Sanitation (Law of 22 Dec. 1888; 21 July 1902). The province also provides for other services connected with secondary education and agriculture.

FEDERICO CAMMEO,
Professor of Jurisprudence, Royal University of Padua.

10. Italy — Department of Justice. Justice, in civil and penal matters, is administered in Italy by justices of peace, county judges (*prætors*), tribunals, appellate courts, assizes, and the supreme courts.

Special laws regulate the jurisdiction of military and naval crimes. A college of officials of the public ministry is established at every tribunal and every court. Before the county judges (*prætors*) the functions of the public ministry are administered by vice-prætors or public securities or common counsels, or by ordinary citizens who are occasionally appointed by special delegation.

To each of the above mentioned tribunals there could be applied additional magistrates and auditors. The number of magistrates and judges of the different categories, and the boundaries of the territory wherein they exercise jurisdiction, is fixed by law, and cannot be changed by executive power. This principle is important in relation to the fundamental constitution of the kingdom, that every man must be tried in the district where he is a resident.

The magistrates (except the judges of the peace) are all nominated by the king, at the proposal of the minister of justice, from among those who have the requirements prescribed by law. No one can become a magistrate who has not served his novitate as an "auditor," except the advocates and the solicitors, who may be received after a certain number of years of professional practice in the magistracy, or as judges or as officials of the public ministry.

Auditors are admitted after oral or written examination, provided they have been admitted to the bar. After 18 months' practice they may pass by examination to the rank of additional judges. This is the source of supply from which future county judges (*prætors*) or judges are selected. Every other profession or office is forbidden to the magistrate, except that of county or common counsel and of deputy in parliament, but with some restrictions concerning the place of the election and the number of judges who may be deputies. There is a strong expression of public opinion which seeks to make this office incompatible with every other. The trials are public unless the judge considers that for moral reasons a case should be tried behind closed doors.

Justices of Peace.—In every community there is a justice of the peace, nominated by the first president of the court of appeals of his district, who must be selected from a list of eligibles submitted to him by the municipal authorities. This list is formed each year. The justice of the peace has two functions; one of being a mediator and peacemaker in controversies of every kind. He is obliged (if requested by one of the quarrelling parties) to bring matters to an agreement by summoning the other party, who, however, is not obliged to appear. Further, he has the function of judge in cases not concerning property rights, as real estate, not exceeding 100 francs in value, and in cases concerning dismissals from the houses or farms, not exceeding 300 francs as reward of letting.

All suits of not more than 50 francs value are settled by the justice of the peace and cannot be appealed. The competency of the justice of the peace is regulated in this manner by the new laws of 16 June 1892, No. 261, 28 July 1895, No. 455, and 24 Dec. 1896, No. 547, because the code of the civil law entered into effect on 1 Jan. 1866 (at the time of the legislative and administrative unification of the new Kingdom of Italy after the wars of 1859 and 1860), circumscribed the competency to 30 francs. The enlargement of power did not have good results, so there is possible a return to the former restriction that the justice of the peace may be peacemaker for all kinds of controversies but can only act as judge in cases of small money value.

County Judges.— In every district there is a county judge (*prætor*) to whom, according to the pressure and importance of his work, can be assigned one or more assistants, selected from recent graduates of a law school or from the assistant judges. The assistant judge can be nominated county judge after two years' practice as assistant. The county judges pass sentence, in civil and commercial matters, in law suits of a greater value than those over which the justice of the peace presides, but which may not exceed 1,500 francs, except suits of honorary civil or political rights wherein the State is interested. Further, they pass sentence in law suits of any value concerning personal possession.

In penal matters the county judge may pass sentence upon all crimes not libellous, for these the sentence cannot exceed three months of prison, one year of exile, or 1,000 francs fine.

Law suits of executive proceedings are also tried before the county judge, provided they concern household goods. Further the county judge may preside over family councils and decide questions of guardianship for children and feeble minded people. It is not necessary that the defense before the county judge is conducted by an advocate or solicitor, but, in civil or commercial cases, it is sufficient to have a citizen who is considered capable on the authority of the judge.

Tribunals.—The members of the judicial authority, named tribunal, are called judges and county judges (*prætors*), and assistant judges can be nominated judges after several years of service. In each district there is a tribunal. The tribunal judges, in civil and penal cases, with three members, and in the largest towns, where the number of trials is great, the tribunal is divided into sections. The chief of the tribunal is called president. In the first in-

stance the tribunals try all cases, civil, commercial and criminal, exceeding the competency of the county judge. This limit has already been indicated. They also try heavier criminal and libel cases. The tribunes appeal cases sentenced by the county judge in the first instance as well as civil, commercial and penal matters.

In civil cases the suitor is obliged to have the assistance of a solicitor. Even if the suitors wish to appear and represent their causes personally they are always assisted by a solicitor who can interfere if, according to the president's opinion, the quarrelling parties are either too inexperienced or too angry to continue their own defense.

In criminal cases the accused must be defended by a lawyer. At every tribunal there must be an attorney of the people, who is called solicitor for the king. In criminal cases this public minister represents human society which punishes the crime, and if he thinks the suspected man is guilty, he makes the accusation and requests from the judge his condemnation. If, on the contrary, he believes in the innocence of the accused or of some extenuating circumstances he can demand of the public ministry his release. The presidents of tribunals and the prosecutors for the king are magistrates of equal degree.

Appellate Courts.—Every appellate court consists of at least two sections, one for the penal cases, and one for civil cases. Where, on account of a larger population, the number of cases is greater, there are more sections. The members of the appellate court are called counsellors and are of the same rank as the president of the tribunal. At the head of each of the sections composing the court, there is a president. The latter is equal in rank to the counsellors of the court of cassation, while the first president of the appellate court is a degree higher than the counsellor of the court of cassation. Before the appellate court are brought, on appeal, all penal and civil cases judged by the tribunals in the first instance. In civil cases the court judges with five members; in penal cases, with four members. Every appellate court has an office of the public ministry represented by a general solicitor of the king and by one or more substitutes, according to necessity. Matters of ordinary jurisdiction can be appealed before the appellate court, and here is heard, also, the opinion of the public minister, and it is decided upon by the members in council.

Assizes.—These courts are exclusively for penal cases, and are distinguished from all other magistracy because there are coöperating judges, called "jurors," who are selected by lot from a list of citizens, which is revised every year. For each session 30 jurors are selected, from these are chosen 14 for each case. Out of these 14, 12 are acting jurors and two surrogate jurors, in case one of the acting jurors should be absent during the trial.

There are one or more courts of assizes for every district of appellate court. They sit generally twice every year, in spring and in autumn. But, if necessary, there are extra sessions. The court of assizes is presided over by a magistrate who is counsellor of the appellate court or president of the tribunal. The court of assizes is competent to judge all political crimes and all of the other more serious crimes which receive the penalty of more than 10 years in the penitentiary. The jurors pronounce the sentences based upon the facts which constitute the accusation, without manifesting reasons, but merely by a yes or no given after a secret consultation. The jurors, being 12 in number, the majority decides, but in cases of equal votes, the verdict which is favorable to the accused is the one taken.

After the verdict of the jurors, if affirmative, the court may be of the opinion that the facts do not constitute a crime, according to the code. This almost never occurs. Ordinarily when the verdict is affirmative (that is with at least seven votes) the court pronounces and determines the penalty. Against a sentence of the court of assizes no appeal is possible, only a recourse to the court of cassation for violation of the law.

Supreme Court—Courts of Cassation.—There are five courts of cassation in Italy. This multiplicity is in contradiction to the function of magistracy of pure justice which characterizes one court of cassation. But Italy, formed so recently by the uniting of several states, was unable to eliminate completely from every State all their central organs. She was obliged to leave the courts of cassation, as well as several other things, at Turin, at Florence, Naples and Palermo, and was obliged to form a court of cassation at Rome when this became the capital of Italy. However, though there are apparently five courts of cassation, in substance there is only one, divided, however, into sections which instead of being all united at the capital, are distributed among several cities of the kingdom. The penal jurisdiction has been completely barred at all the other courts and entirely concentrated at Rome. To the Roman court has been exclusively consigned all cases concerning taxes and eccleciastical matters. The court of cassation in handling civil matters is composed of seven members. It examines the sentences from which an appeal has been taken, and if no error of justice appears the appeal is rejected and the case finished. But if some error of justice (in form or substance) appears, the sentence is annulled and, without judgment, is dismissed to another magistrate of equal rank to that whose decision has been cancelled. This last magistrate is free to judge according to his personal opinion, but his sentence is also subject to an appeal to the court of cassation in many cases. The court of cassation in Rome is also invested with the power of regulating questions of jurisdiction between the administrative authorities. Therefore when a sentence of appeal is denounced on account of having been unjustly judged on the question of competency there is no other recourse than to the court of cassation in Rome. Thus the court of cassation in Rome has the function of a supreme court, and as the Kingdom of Italy is governed by the parliamentary system and there is no plurality of states, there can be no question as to whether a law is or is not constitutional (as happens in the United States and in the Confederation of Switzerland); the law being an emanation of the power of the throne which judicial authority can never dis-

pute but must always respect. Judgment on the constitution can only be passed in Italy on the decrees and acts of the government as an executive power, inasmuch as we may decide whether the law of the State has been broken, because the executive power can exercise free action over the facts which are not regulated by law. But in cases of facts which do come under the law, the executive power has to conform to them. However, the decision, provided the act of the executive power be constitutional, belongs entirely to the judicial authorities.

Military Justice.—For crimes committed by soldiers and officers of the army there are military courts which judge without possibility of appeal, but from whose decision recourse can be made to the supreme tribunal of war and navy which functions in the same way as the penal court of cassation. Analogously, there are maritime tribunals for sailors and officers of marines which have recourse to a similar supreme court.

Jurisdiction of the Court of Accounts.—The court of accounts is instituted to examine and decide all controversies which concern the accountings of the administration of the State, of the provinces and communities and further has to decide in all controversies regarding the pensions of employees of the State.

Jurisdiction of Council and State.—The council of the state is a consulting corporation divided into three sections for the various matters which must be interpellated, and passes its opinion on the affairs of the State; further, there has been added a fourth section which is charged with the jurisdiction of all affairs in which a private person or a corporation claims to have had his interests interfered with by an unjust administrative act of some local or central authority. The recourse to the fourth section is made in the same way as the recourse to the court of cassation, and a discussion between the lawyers of both parties is public.

Other Special Jurisdictions.—In every province there is an administrative corporation, to which recourse can be made in certain categories of affairs, and the decisions of which can be denounced for violation of administrative law by the fourth section of the council of state. There are special commissions for the imposts as well as for the custom houses. The power of these commissions is merely to decide the valuation of the imposts and the duties which must be paid. In the case of a question of a violation of the law where duties are demanded where they are not due, the power belongs to the judiciary authorities.

Hon. Ettore Sacchi,

Member of Parliament; formerly Minister of Justice of the Kingdom; author of works on functions and limitations of Tribunals and Courts of Appeal.

11. Italy—The Papacy and the Government. Italy has been called upon to solve the gravest and most important problem that has agitated modern Europe—that of the abolition of the temporal power of the Pope. We cannot here dwell on the history of the rise of this power. Its *raison d'être* at the present day, from the ecclesiastical point of view, is that, with the Catholic Church organized into a monarchy, with the Pope as sovereign of the Catholic world in Rome, he would have sought to secure the independence of the Great European States, and would have acted as pacificator and umpire in settlement of their differences. Those states on their part recognizing the value of the influence of the papacy for their own purposes, would consequently take care that this great power should not fall into bondage to any one of them, but should remain independent and autonomous.

Hence it followed that the popes sought to form a temporal power of their own, in which they should rank as independent sovereigns, and since they were unable to form one strong and powerful state, they sought to keep Italy divided up into several petty states, thus preventing the formation of one preponderating power in the peninsula. For this reason every attempt towards the unification of Italy, or towards bringing it under one dominating power has always been opposed by the papacy.

Europe also opposed the unification of Italy for different reasons; but the desire to protect the temporal power of the Pope by preventing the unification of Italy was also a factor in European politics.

After the overthrow of the French domination in the 19th century, the Italian national sentiment gradually developed, and as the desire for the independence of Italy grew, the problem of the temporal power of the papacy was made a matter of serious consideration by the writers and political men of the day. But if in order to establish this federal idea and realize this beautiful ideal of Italian unity, she should despoil the Pope of his temporal power, Italy felt that she would incur the ill feeling of Europe. Hence, unification seemed impossible. Hence, the neo-Guelphism of V. Gioberti, which originated the idea of making the Pope the head, the President, of the Italian federation. But during the revolution of 1848-49, when the idea of the independence of the Piedmontese monarchy originated, it seemed necessary for the unification of Italy to abolish the temporal power of the Pope.

After the revolution of 1859 Gioberti's idea as proclaimed in his great work, 'Il Rinnovamento,' that Rome should be the Capital of Italy, and that there should be a reform in Catholicism through which it would no longer be necessary that the Pope should hold temporal power, seemed fulfilled in *Italia Unita*, and Cavour, the great statesman, proclaimed in the first Italian parliament, held in Turin, that Rome was henceforth the Capital, and declared that in Rome, Italy should proclaim the liberty of the Church, that is to say, granting to the Pope, by mutual agreement, independence in the exercise of his spiritual sovereignty over the Catholic world; and liberty to regulate the affairs of the Italian church, thus abolishing the existing concordats and laws which were in force in several of the Italian states, after the manner of the other Catholic European states.

When Cavour died, the Roman law courts objected to all agreements entered into by Cavour, and the Catholic world endeavored to prevent Italy from taking possession of Rome, and as the pontifical states in 1860 were no longer able to govern themselves, the French occupa-

tion, begun in 1849, was continued, although the Emperor Napoleon III. in 1864 pledged himself to withdraw the French troops; but he did not do so until 1866, only to send them back again in 1867, when Garibaldi attempted to take forcible possession of Rome. Italian statesmen in the years 1861 to 1870 endeavored to persuade Europe that should Italy take possession of Rome she would give ample guarantees of independence to the Pope and liberty to the Church, and thus they prepared the way for an occupation to be undertaken as soon as a favorable opportunity presented itself. And this occurred in 1870, when France, engaged in a war with Germany, was obliged to withdraw her troops, and in addition to her other disasters, came the fall of Napoleon, who had formed with Italy the agreement of 1864.

On the 20th of September Italy took possession of Rome and declared herself absolute temporal ruler, with the acquiescence, more or less cordial, of all the European governments. The latter, confiding in the promises of the Italian government, no longer interested themselves in the question of temporal power and the «Roman Question,» that is, the attitude of the Pope and of Italy in regard to the possession of Rome, was considered a purely Italian question, in which it was not permitted to foreigners to intermeddle. The Law of Guaranty was passed by parliament 19 May 1870, assuring independence to the Pope and liberty to the Church. At the time this law was criticised bitterly, even by those who, afterwards becoming ministers, scrupulously observed it themselves, and made others observe it; for they were convinced that through this law Italy would succeed in making the abolition of the Pope's temporal power an accepted fact.

The law has two clauses: the first, concerning the prerogative of the Pontiff and of the Holy See. The person of the Pope is declared sacred and inviolable; all public and personal attacks on his person, evil speaking and other offences directed against him to be punished as though they were directed against the King. But as this special protection guaranteed to the Pontiff did not diminish or prevent the liberty of conscience and of the press, it was explicitly stated that the discussion of religious matters was freely permitted. By this arrangement the law recognized in the Pope a sort of spiritual sovereignty, independent of the temporal power—with which he was invested primarily—and also gave back to him sovereign honors and recognized his precedence, as is done by other Catholic sovereigns.

Once his sovereignty was recognized, the Pope could maintain a guard of honor, divided into classes, Swiss Palatine and Noble, none of whom, however, have any recognized military rank in the national government; in fact the men who compose them, even though Italian citizens, are not subject to military duty as are ordinary troops. The number of these guards was not determined; the law reading «the usual number» was meant only to prevent the enrolling of so large a number as to be a menace to public order. The spiritual sovereignty of the Pope gave him the liberty to perform all the acts of his spiritual ministry, communicating freely with the Catholic world, planning as he saw fit the administrative policy of the Holy See, which was again called «Curia Romana.» It was therefore ordained that no political, administrative, or judicial authority should, without permission from the Pope, enter the palaces or places of his residence. It was forbidden to visit, to make a police search, or sequestration in the papal official «congregazione,» which corresponds to the cabinet of a secular government. The Pope may affix to the doors, the gates of the Basilica, and churches of Rome (a historical manner of publishing the Pope's mandates) the acts of his administration. The foreign ecclesiastics who hold positions in the «Curia Romana» enjoy the same personal privileges as citizens. They cannot be expelled, nor be prosecuted by law, or otherwise molested. The Pope corresponds freely and independently with the Catholics in Italy and abroad; he may install in the Vatican, or in the place of his residence, post-office officials, telegraph and telephone operators, these employes to be chosen by himself.

The papal post-office correspondence is transported in a closed bag to the postal officials placed on the frontier, and papal mail matter is remitted by the Italian officials gratuitously. The same rule is observed for telegrams; the papal wire is connected with the rest of the state, and the papal telegrams are in the same category as the telegrams of the Italian government and are transmitted gratuitously as if the postal or telegraphic correspondence were addressed to the King.

It is a secular custom that the institutions for ecclesiastical instruction and education in which the Holy See has the greatest number of dignitaries and functionaries, should be situated in Rome, and its six adjoining bishoprics, which are immediately subordinate to the Pope as Bishop of Rome. Now because in this the Pope is entirely free, these institutions are withdrawn from all interference from the school authorities of the state, for the Pope can nominate whom he will to the higher ecclesiastical positions, and the bishops the same for the smaller ones, without the authority of the government, giving the *exequatur* to the orders in the first instance, and the *placet* in the second, for the enjoyment of the benefices annexed to these positions as well as for others in the kingdom.

With the purpose of removing any pretext for outside interference, and moved by the necessity of providing for the economic exigencies of the Holy See, the law has ordained a species of civil list for the Pope of 3,225,000 lire (about $645,000) a year, entered in the great volume of Public Debt as a perpetual and inalienable payment free from every kind of tax. The sum was fixed according to the balance of the Roman States of 1848, the only one published. This fund must be used for the support of the Pope, for the various functions of the «Curia Romana,» for the maintenance in ordinary and extraordinary of the palaces of the Vatican—for the stipends of those employes attached to the court, to the museums, to the picture galleries, to the libraries, etc. The Pope has never demanded payment of this money, but the agreement to pay on the part of the Italian government has never been withdrawn, hence the total

credit remains intact, though every five years the interest is outlawed, according to Italian State custom.

The apostolic palaces (Vatican and Lateran) the Villa of Castel Gandolfo and their dependencies according to Italian public law should have been declared part of the government domain; instead of that, this declaration, on account of political exigencies was omitted, and by Art. 5 of the law the enjoyment of them was given to the Holy See in perpetuity, but at the same time the archæological collections and the libraries adjoining are declared inalienable, which means that the Pope and the Holy See have no proprietary rights to them (as the clerics pretend) which would comprise the right to alienate, by sale, exchange, or donation.

The Pope has besides, as an adjunct to his sovereignty the right to an active and passive embassy, that is, the Italian government recognizes in all his functions the Ambassador of the Holy See (just as the King of Italy recognizes any other ambassador), and similar privileges throughout the kingdom.

As the papacy is an elective monarchy, and during an interregnum the sovereign power is vested in the College of Cardinals, which elects the Pope in conclave, the Italian Government is obliged to protect the conclave from all molestation and is hindered from placing any obstacle to the personal liberty of the cardinals. Hence the ecumenical councils throughout history are regarded as sovereign asssemblies of the Church, and receive the same consideration as do their individual members. But now, since the proclamation of the dogma of infallibility, it is very difficult for them to continue as councils, as the Pope may *ex cathedra* define and proclaim the religious truths obligatory upon the faithful (dogma).

Such is the law which, since 1871, has governed the relations between the Pope and the government. It was never fully accepted in the Holy See, but nevertheless, she enjoys all its privileges of a practical nature, which the government always observed and caused to be observed. Undoubtedly there never before was a time when the spiritual sovereignty of the Pope could be declared as openly as at present, as was proved by the two conclaves held since 1870. In spite of all this, and with all the conditions essential to this freedom, and the enjoyment of the privileges and protection of the law, the papacy has never recognized the State régime of affairs established in Rome in 1870. When the Pope and the King came to an explicit understanding it was natural to believe, in the Catholic world, that either the Pope would subordinate his spiritual acts to the interests and political advantage of Italy, or that the Italian government would subordinate its policy to the exigencies of the Pope and the Church. Official animosity, by reason of the Law of Guaranty, enabled the Pope to enjoy that independence which, for centuries could not be maintained unless by retaining the temporal power, and permits the Italian government to maintain, in fact as well as in theory, a perfectly independent position in regard to a power as morally great as the papacy. Thus, the official enmity serves both parties: it suits both that the Pope should consider the government as a usurper.

This official enmity was associated with a personal enmity, which has never prevented secret agreements with the papal authorities responsible for the safety of the Vatican and the Pope, and the political authority of the kingdom, during the pontificate of Pius IX., and at longer intervals during that of Leo XIII., who sought to isolate Italy politically, and thus to weaken, if not destroy the monarchical institution; under Pius X., the present Pope, this enmity is up to this time only official. This Pope was never a cardinal of the Curia, but during the time he was priest, pastor, and bishop he had always held a simple cure of souls, at a distance from Rome, and he saw in his youth foreigners ruling over his native country (Venice), and he exulted when he saw the Italian tricolor flag substituted for the Yellow and Black standard. As a patriarch of Venice he frequently had dealings with the sovereigns of Italy (for Venice was acquired through an international treaty, and legitimately conquered by the House of Savoy), and he assisted in putting a stop to the socialist propaganda, which at the same time attacked monarchical institutions and religion, and he opposed it at Venice, inducing the faithful in the Church to vote in accord with the liberal monarchists. When he became Pope he could not forswear his former attitude, hence, while abstaining from every action which gave assent or approval to the established conditions of 20 Sept. 1870, when the King's soldiers entered Rome, he did not continue the unyielding anti-Italian policy of Leo XIII., and evidences were soon perceived of this new line of conduct of the Holy See. Pius X. is a religious Pope, and as religion and the Church are not being persecuted, he permits frequent infractions of the law *non expedit:* that is to say: the formal prohibition of Catholics from taking part in political elections, which was promulgated by Pius IX. and confirmed by Leo XIII. But just because he will not recognize Rome, even implicitly, as the capital of the Kingdom, he has always opposed and continues to oppose, the formation of any Catholic party in Parliament. The Catholics should vote for a monarchical candidate in preference to a Republican, or a socialist. Catholics loyal to the Holy See may enter parliament and swear fealty to the King and the Constitution, but none has the right to call himself a representative of the ideas and principles approved by the Pope. And this was stipulated, because otherwise it would appear as if the Pope acknowledged the right to the possession of Rome, and the electors and parliamentary deputies faithful to the Pope, and the interpreters of his views, would be unable to deny the fundamental principle of this acknowledgment, namely: the unity of Italy with Rome as its capital. Hence it is not possible in Italy to form a party similar to the Catholic Centre in the German Reichstag.

Thus it happens that now between the Pope and the King, that is, the Italian government, there is an official enmity, a lack of friendly feeling of agreement, and there exists only a practical *modus vivendi*, founded on the Law of Guaranty which obviates all cause of controversy.

And this is the condition of affairs which

best suits both parties: the Pope, because the prosecution of open hostilities would not be agreeable to the sentiment of the great majority of the clergy and of militant Catholics; whilst the open recognition of Rome as the capital would clash with prejudices, not yet removed, and would diminish the reputation of the independence of the Holy See in the Catholic world. It suits the King's government because it removes the necessity of regarding the Pope, his faithful clergy, and the more zealous of the flock, as enemies, and allows him to enjoy the indirect aid of the first, and the direct assistance of the others in combatting the subversive parties without assuming any obligation to make legislative concessions which might change the secular character of the Italian government, and also without incurring any kind of responsibility towards foreign governments through the international policy of the Holy See. Will this condition of things be permanent? No one can say; but it is certain that no Pope will again assume the unyielding attitude of Pius IX. and Leo XIII., and also that as long as the present organization of the Catholic Church exists no Pope will ever arrive at a perfect agreement, or sincere friendship with Italy, namely, at what is called *concilia zione.*

But the necessary condition for the consolidation of this state of things is the maintenance of the «Law of Guaranty.» By this means the Holy See and the Church will avoid in Rome serious trouble, and Italy will not see the birth of civil dissensions which would be a menace to her prosperity. Everyone in Italy is agreed on this point, and no statesman, no matter how anti-clerical, would think of changing it. Although it does not form a part of the national constitution, it is nevertheless looked upon as a law of constitutional importance, and as such cannot be changed without radically changing the order of fundamentally Italian institutions. It has not, in truth, the character and importance of an international law, *i. e.* a law which implies a strict contract with other governments, but for all that the Italians are convinced that it cannot be disregarded without interfering with the position that Italy occupies in the international society and producing a serious and perhaps ruinous change in her position in the political world.

Therefore everyone in Italy is agreed on the maintenance of this law, although they recognize its defects. This is a compromise truly worthy of the character and political traditions of the Italians. And hence, this law expresses the nature, the character of the people, which is averse to exaggeration and to all kinds of excess: it agrees with its tendency to compromise and to surmount difficulties by strategy rather than force. Besides all this it is a historical necessity which Italy could not disregard after having abolished the temporal power of the Pope. Not in vain were Nicolo Machiavelli and Francesco Guicciardini, those founders of the art and science of diplomacy, born in Italy.

DOMENICO ZANICHELLI,

Professor of Constitutional Law, Royal University of Pisa. Honorary Professor of the University of Siena.

12. **Italy—Political Parties.** In order to understand the origin of the political parties which asserted themselves in the first Italian Parliament we must remember that the unity of Italy was obtained by the combined forces of the constitutional monarchy of Savoy, which governed the ancient kingdom of Sardinia, and the ancient revolutionary and Republican Party which from 1832 had had as its master and inspirer Mazzini, and as a leader, during the events of 1859-60, Garibaldi.

In 1861, the Kingdom of Italy being established but not fully organized, the Right, which was more numerous, and was composed of all those who having followed the impulse given by Count Cavour admitted unconditionally the monarchical constitutional form of government, because they saw that monarchy was indispensable not only to complete it, but also in order to the continuance of the unity of Italy. On the contrary the old Mazzini conspirators and the most active and enthusiastic followers of Garibaldi sat generally on the Left.

But very shortly a large fraction of these, accepting the formula of Crispi which affirmed at that time that monarchy would unite Italy and a republic would disintegrate it, gave in their adhesion more or less conditionally to the monarchy, and constituted the Constitutional Left, which thus little by little became distinct from the Extreme Left, to which belonged all those who remained more firmly attached to the traditions and to the doctrines of Republicanism.

Until 1870 the question which chiefly divided the Constitutional Left from the Right was that relating to the method to be followed in completing the unity of Italy. The members of the Left, in accordance with their principles, had the greatest confidence in conspiracy and popular movements, while those of the Right, who had always been lovers of law and order, or had connected themselves entirely with those principles, placed their confidence above all in the action of government, of diplomacy, and of the regular army. But the difference in the platform of the two parties was not as great as that of their origin and political education which caused them each to remain well disciplined and compact, so that the Right always remained in favor of the government, and the Left always opposed to it. Both one and the other, however, had a pronounced anti-clerical tendency; for at that time the temporal power of the popes was an obstacle in the way of the perfecting of Italian unity, and the Pope had prohibited all those in whom the religious sentiment predominated over patriotic feelings from having a seat in the Chamber of Deputies, and participating in political elections.

The unity of Italy being an accomplished fact with the taking of Rome in 1870, the ranks of the Left were gradually increased by all the malcontents which the new régime had created owing to the superfluous concentration of bureaucracy, and on account of the heavy burden of taxation, so that in 1876 they were able to obtain a majority in the Chamber of Deputies and get control of the government. But the superfluous outside elements which had crept into the party: the inherent lack of discipline of the ancient revolutionary elements which yet lingered in their composition, and, above all, the

lack of a definite programme, which, after 1860, should distinguish the Left from the Right, caused disorganization and disorder to enter the ranks of both the old parties. In consequence of this Depretis, who, with a few interruptions, was Prime Minister from 1876 to 1887, governed with the support of a majority composed of elements of the Left and of the Right. A small group of «intransigeants» from the Right did not join the majority, also a few groups of the Constitutional Left who adhered to the other parliamentary leaders, among whom was Crispi; and, lastly, the Extreme Left, who at that time was very numerous and very tenaciously attached to the revolutionary and Mazzini traditions. The situation was not notably modified when, in 1887, Crispi came into power; nor under the successive ministries presided over by Rudini, Giolitti, Zanardelli, and other parliamentary leaders. From that day to this, the only new events of importance which occurred in the composition of the representative parties in the Italian Chamber of Deputies, were the disappearance of the little group of «intransigeants» of the Right wing on the one hand, and the entrance and establishment of the Socialist Party, and of another of more recent date, composed of a small number of deputies, calling itself the Catholic or Clerical Party.

It has already been mentioned that until the end of the pontificate of Leo XIII, the Clericals as those are called in Italy, in whom the religious sentiment prevails, and who obey the injunctions of the ecclesiastical authority, took no part in the political elections. But now the constitutional candidates are frequently supported by Clericals in opposition to the Socialist candidates, and sometimes even to the Republicans. It, therefore, not infrequently happens that when two candidates are in the field—one constitutional, and the other clerical—they vote for whichever candidate shows himself best disposed and less hostile towards the interests of the Church. In five or six colleges the success of those candidates was assured who openly declared themselves the defenders of those interests. Although united in this one platform they yet act independently and all vote as they please on all questions that do not pertain to principles of religion, and hence do not form the nucleus of a true political party.

At present more than four-fifths of the Italian deputies (about 420), openly adhere to the present monarchial institution under the house of Savoy. They are divided into the Right, the Constitutional Centre, and the Constitutional Left; but these names have at the present time a signification which is largely topographical, *i. e.* having a relation to the position that each deputy occupies in the Chamber, or, at most, they serve to distinguish the adherents of the different parliamentary leaders. Thus, the followers of Rudini prefer to remain on the Right, those of Sonnino are all found in the Centre, while on the Left are seated the most faithful constitutents of Giolitti, and all those who were previously attached to the fortunes of Zanardelli.

With much reserve and many exceptions, in the Constitutional Left may be found the greatest sympathy for a popular programme, and above all, among the deputies who are the Extreme Left. There undoubtedly belong to the Constitutional Left many deputies who have positive anti-clerical sympathies, and many others who show no marked political preference and are always ready to vote in favor of any government.

The deputies of the Extreme Left, who now number about 90 and are subdivided into Radicals, Republicans, and Socialists, have more pronounced political sympathies. The first group (Radicals) is the most numerous; the second (Republicans) the smallest. Nevertheless, among the Radicals are some old Republicans, who with the lapse of time have come to admit that even a constitutional government may become a legitimate government, that temporarily, at least, it may be of benefit to the country. The Republicans, on the other hand, remain strictly faithful to the old platform of Mazzini, but with some of them this fidelity is rather the result of attachment to their own political past than of a lasting conviction and choice. The Socialists, finally, are subdivided into reformers and revolutionaries; but these two factions are determined rather by personal rivalry between the leaders of the party than by substantial differences in their platform. Although both adhere to the humanist doctrine, for the time being they confine themselves to supporting laws and provisions that favor government, or municipal ownership of public institutions, and strengthen the hand of the labor unions.

The parliamentary system in Italy being as it is, the Ministry should naturally control the majority of the Chamber. This majority is ordinarily composed of deputies from the Right, the Constitutional Centre and the Constitutional Left, with this distinction—that sometimes the one wing predominates, sometimes the other. It is not infrequent that the radicals, and even the Republicans and the Socialists vote for a time for a certain Minister on the promise of a certain law or provision in which they are interested. There is always, however, in the Chamber, a more or less numerous party of the opposition formed by two groups of constitutional deputies whose leaders do not form a part of the Ministry, and these are joined by some independent deputies and those who, for personal reasons, are dissatisfied with the government. In the long run the opposition can also always count on the support of the Extreme Left, or at least of the greater portion of it.

This almost anarchial condition of Italian political parties may well astonish those who are accustomed to the more severe discipline of parties in the United States of America, in England, and even in Belgium. But we must take into consideration that in Italy political parties exist rather in the Chamber of Deputies than in the whole country. In fact, outside of the Chamber, only the Socialists and the Clericals have truly organized parties. The truth is that the great majority of Italian candidates count primarily on personal friendship, loyalty, and influence for their success rather than on the support of a political party; and although there are a certain number of persons, particularly in large cities, who vote according to their political convictions, there are more who cast

their vote purely and simply for the man they know and respect, or from whom they hope to gain some advantage.

The consequence of this is that one finds some colleges in which there are no Republican electors, electing a Republican deputy, and a college, which yesterday elected a man of the Right Wing, the next day—without any change having taken place in the political opinions of the electors—electing a man of the Left Wing, and even a Radical. Primarily, therefore, in the majority of cases it is the deputy who gives the political trend to the college, not the college that influences the deputy. The deputies, therefore, entering the Chamber not through the means of a party, but almost free from all party obligations, usually place themselves at the disposal of the parliamentary leader who inspires them with the most confidence, or the greatest sympathy. And if the new deputy should hold himself aloof and independent he seldom does it from noble and worthy motives, but more frequently in order to be better able to give his vote to the whole Ministry in exchange for some local advantage for his own college, or for some personal gain for himself or his friends who have been most active in the elections.

GAETANO MOSCA,
Professor of Constitutional Law, Royal University of Turin.

13. Italy—Italian Socialism. It has often been remarked that Italy during the 19th century, and especially during the period immediately preceding the establishment of United Italy, contributed very little to the universal progress of Science, Letters, and Arts. The intellectual activity of the nation was engrossed in the long struggle for national independence. It was the overwhelming absorption in this same conflict which so long retarded the progress of Socialism in Italy. Sixty years ago Italy had produced no Lassalles, no Engel, no De Poepe, no Fourrier, no Owen, no Henry George.

After the accomplishment of Italian independence and union Milan became one of the great commercial cities and Genoa one of the most flourishing seaports in Europe; then the nation witnessed the first efforts of Italian workmen and peasants to secure something more than the expulsion of the oppressive foreigner from her soil, and the unification of their country. In other countries the *Internationale* exhausted its power in the contentions between Bakounine and Marx, *le petit* Thiers crushed the Paris Commune before the Italian working classes began their struggle against capitalism. Of «socialism»—so called—Italians had previously heard only the denunciations and theistic sermons of Giuseppe Mazzini, which, however humanitarian, are religious and individualist, and not socialist.

Moreover the Italian fight for freedom retarded the growth of Italian Socialism in a way which has passed almost unobserved and which in the absence of documentary proof is vigorously denied by Italian Conservatives. It is, however, true that the enthusiasm which prompted Italians to conspiracy and rebellion and high martial valor on fields of battle, to secure the liberty and unity of their country, was not inspired solely by patriotism. Many Italians anticipated that with union and independence certain great and radical reforms would be obtained. For some of these warriors the patriotic strife implied socialistic ideals, it certainly admitted of a socialistic mirage. Evidence of this is to be found in many popular sayings and songs current during the early half of the century, and in expressions scattered through many printed and written documents.

From the very beginning the National party was divided into a right and a left faction. The satirical Tuscan poet and patriot, Giuseppe Giusti, in his letters often qualifies as communists, or adepts in communism, several of the men who afterward fought for Italy. The epithet becomes significant in view of the terror which Giusti, and every other loyal *Conservatore,* felt when he detected even a taint of unconscious socialism in this preeminently patriotic struggle.

Again! After Giuseppe Garibaldi had gloriously guided his army of a thousand heroes in the conquest of Sicily, and it was necessary for him to assume the statesman's part, and as *Dittatore* of Sicily, to establish a new and adequate government in the conquered land; by the advice of Francesco Crispi and his other councilors of experience and wisdom, Garibaldi, in an almost forgotten proclamation, offered to let the islanders divide among themselves the State domain, thus clearly indicating how largely these patriots were imbued with the ideals of socialism. As long as this patriotic enthusiasm continued, there remained a vague hope that economic reform would grow out of political reform. Hence the political revolution checked socialism; both by engrossing intellectual forces that might otherwise have prepared public opinion for socialistic ideas, and by promising to achieve that economic redemption of the working classes, which in other countries socialism promised to accomplish.

But the echo of the last battle for liberty had scarce died away when many Italians realized that so far as the economic redemption of the lower classes was concerned, the Italian revolution was eloquently described in Dante's line,

"Lunga promessa coll' attender corto."
(An abundant promise and a meagre fulfilment.)

Some of the very men who with lofty patriotism had fought for the political freedom of Italy, were among the first who perceived that these expectations had not been realized. They were men trained to plan and successfully execute a political revolution, and believed that the same violent means would be equally successful in the field of social revolution. They believed that an emulator of Garibaldi, strong of will and of dauntless courage, could stand on the field of economic conflict, as he had stood on the martial field, and with equal facility achieve not less wonderful victories. Such men were prepared to listen to Bakounine's propaganda of violence, but they were not ripe for a socialism which taught respect for existing laws.

Everything pointed the same way. The prevalent sympathy was for France. Victor Emanuele wished Italy to join in the war against Prussia. Garibaldi and his volunteers were fighting in the ranks of the French armies, pub-

lic opinion followed fascinated, the tragedy of the Paris Commune. Moreover the taxes and customs duties, often on articles of necessity, pressed heavily, and a wind of rebellion blew from all quarters, against these imposts, against the men who devised them, and against the institutions for whose benefit they were levied. Poverty in the country districts was great. Italian government bonds were 40 per cent. below par, the rate of exchange was 15 per cent. against Italy, trade was depressed and industry arrested. Unpopular taxes are a strong inciter to rebellion, and the recent examples of successful revolt suggested a means of speedy and practical relief for the impoverished nation.

In the year 1872 Rome was released from the temporal power of the Church; that same year saw the completion of the patriotic era and the birth of avowed socialism. The internationalist doctrine, as then professed by the *Internationale,* spread over all the land. In Bologna, in March, 1872, and in Rimini in August of the same year, were held the first meetings of the Italian sections of the *Internationale.* The second of these meetings proposed the international socialist congress that was held at Saint Imier in Switzerland, 15 Sept. 1872. At this same congress the deputies of five national federations—followers of Bakounine—repudiated the *autoritario* movement begun by Marx, which was the actual origin of Italian socialism.

This Internationalist movement—or militant socialism—though begun so late in Italy, spread rapidly. It soon numbered more than fifty federated sections, and possessed more than twenty periodicals. Soon there were Internationalist uprisings. The year 1873 was one of great suffering both in the farming communities and in the cities; and in the first months of 1874 strikes and tumult arose in nine cities. In the single month of July there were commotions in 16 different places in Central Italy. In August there was a widespread Internationalist movement in Romagna, and it also lasted long in Tuscany, and in Puglia there were uprisings instigated by the notorious Enrico Malatesta.

A pitiless struggle now began between the Italian police and the Internationalists. Indeed the police organization was the only real opponent, since juries were always willing to acquit. Yet so powerful is the Italian police system—it was even more powerful then—that the newborn party endured terrible ordeals. Meetings were dispersed, associations forbidden, newspapers suppressed, the liberty of some individuals abridged, forbidding them to go to certain places or to meet certain persons, or to be found out of doors after a certain hour. *Ammonizione* and *domicilio coatto* were very real political weapons 30 years ago. But public and private meetings were held, circulars and periodicals secretly printed, and the proletarian movement was not entirely suppressed until after the final insurrectionary rising at Benevento in South Italy marked the death of Internationalism.

Lacking all intellectual preparation, the product of temporary economic conditions, the dream of disordered imaginations, unable to perceive the true ideals and purposes of Italian socialism, and unable to devise a practical way of obtaining them; these anarchists and pseudo-anarchist strivings failed. Yet in the same sense as the pathological temperament of an epileptic is in harmony with his convulsions, so were these convulsive movements of the *Internationale* in harmony with the actual conditions of Italy at that time. Indeed they were the only movements that could be in accordance with those unhealthy conditions.

In Lombardy the different ethnical character of the people and a better education, suggested that the amelioration of social conditions could best be obtained through lawful political agitation, hence it presented collectivism, and not communism as its goal. These two characteristic features of what has been called the *Milanese* dogma, gave it the name of *legalitario,* or *autoritorio.* The leaders of this movement were Enrico Bignami and Osvaldo Gnocchi-Vianni, who wrote in the periodical *La Plebe,* first published in Lodi and afterward in Milan. Except in Lombardy, Italy did not support this movement for legalized socialism. Its methods were too modern, too scientific, too conservative, to appeal to a people ignorant, exasperated, and with little political experience. Better rebellion and anarchy, than the slow political and social preparations counciled by the law-abiding collectivists of the Milanese group.

After the failure of the Internationalist outbreaks, disputes arose between them and the *Legalitarians,* and many of the working classes abandoned Internationalism. The capitalistic party waged war indiscriminately against Milanese Legalitarians and Internationalists. The leaders of these opposing extremes of socialism, involved in one common persecution and exile, soon realized that although divided on matters of minor importance, they could agree on many fundamentals, and that their only chance of success was in a union against the common enemy, capitalism and reaction.

One of the first results of this reconciliation was the adhesion to socialism, of the former leader of Italian Internationalism, Andrea Costa, who, on leaving prison thus addressed his friends:—«Hitherto we Internationalists have been self-centered, engrossed by the logic of ideas and by the preparation of revolutionary plans, which we deemed immediately realizable, and we have neglected the study of the economic and moral conditions of the people and their immediate and bitterly felt wants. We have accordingly disregarded many of the activities of life, we have not sufficiently mingled with the masses and when, with generous impulse, we have attempted to raise the banner of revolution we have been misunderstood and deserted..... Internationalism has been heretofore the representative principle of a temporary historic moment in the life of our people, it cannot stand for the whole of this life. We do not mean to discard the name «International,» but we want it to *become something more than a scarecrow, we want it to embrace all the socialist parties found in other countries.*»

These authoritative words were the epilogue of the dead Internationalist socialism and the prologue of the new socialism; and the year 1882 marks the dividing line between the old

and the new. Now for the first time did the Italian working classes clearly perceive their objective, and the means by which it could be achieved. This passing of Internationalism and the birth of the new Italian Socialism was neither accidental nor was it due to the propaganda of certain enlightened leaders. Rather was it the result of a betterment in political and economic conditions. The petty and antagonistic states, duchies and kingdoms subject to the influence of foreign powers, had become Italy, free and independent. During the ten years succeeding 1871, the products of Italian mines, many principal industries (as silk and cotton) nearly or quite doubled in the value of their output. And this progress, with some exceptions, has continued. The political change and industrial progress as surely provided the environment and opportunities for the new socialism as the former political unrest and economic depression created Internationalism.

From the wreck of Internationalism arose two parties. One had its chief strength in Tuscany and Romagna, under the leadership of Andrea Costa, who sought to persuade the people that the time for conspiracies was past and that they should claim their rights through legal agitations. The other, in central and southern Italy where industry was languishing, and agricultural laborers desperately poor, found support from a people who maintained their reputation for impulsiveness, and the sentiment of rebellion which they had inherited from Internationalism. In northern Italy where there was industrial activity and comparative agricultural prosperity, the stern Marxist socialism also divided into two distinct movements—the rigidly political party of the intellectual socialists, and the so-called «workingmen's party,» which was socialistic in intention, but which in practice adopted coöperative methods.

These four different manners of interpreting the socialist doctrine differed rather in the practical methods they advocated than on matters of fundamental importance. But all four being newly-adopted were passionately sustained by their neophyte following. Then also all over Italy socialism aroused the opposition of those Democrats and Republicans that belonged to the great middle class; and as in some places socialists opposed and in other places made alliances with these parties, a new cause of dissension arose. It is hardly possible to find a clew out of this tangled maze. History here turns gossip. It is incoherent and—petty. Of these four divisions the most insignificant was that which nearest resembled the defunct Internationalism. The party of legalitarian socialism as taught by Andrea Costa, and which was somewhat imbued with Internationalism, was more important. It was the Labor Party (*partito operario*) which originated in the coöperative group, and the strictly Marxist party which at first comprised only a few intellectual men, both parties originating in Milan, that combined to produce the present Socialist party. The Labor party was formed by actual working men—Lazzari, Croce, Sacco, and others who are still prominent Socialists. Fierce struggles were waged and the first victories won; struggles and victories sometimes against those Republicans and Democrats who sought to compel the Labor party to accept their leadership and protection.

In the beginning the Milan socialists accepted the leadership of the Laborites, and candidates of both parties were found on the same electoral tickets. But at the Congress of Mantua, 1885—the date which records the most prosperous moment for the Labor Party—it was resolved that they would henceforth make no alliance with the socialist or any other political party. Yet in fact at the next political meeting in Milan such agreements were made. At this time men like Felippo Turati, the Italian Juarés; Camillo Prampolini, the apostle of Reggio Emilia, Agnini and Berenini, joined the socialist party, and directed it toward a purely Marxist conception. A few electoral victories confirmed the wisdom of this program and as the Labor party lost influence many of its best members passed into the Socialist party, which now sought to unite all interests, in one compact organization.

In the next Congress, held in Milan in 1891, the anarchists and the Mazzinians were routed by the Marxist socialists, who immediately began to receive large accessions from all over Italy, and the election of 1892 added to the socialist victories. Encouraged also by the colossal growth of socialism in Germany the propagandists labored unwearyedly, and harmony and strength came to the party, and in the memorable Congress in Genoa in 1892, after repelling all reliances with anarchists and coöperativists, the socialists proclaimed the Constitution of the Socialist Italian Labor party. A party which though officially dating from 5 Aug. 1892, did in fact originate in the blending of the Milanese Labor party—an enlightened trade unionism—with the socialist movement in Milan, led by Turati, Gnocchi, Viani, Prampolini and others, and in Central Italy led by Andrea Costa.

It is important to remember that in 1892 capitalism offered no organized opposition to socialism, although socialistic doctrines had been preached all over Italy for twenty years. A weak *bourgeoisie* and a strong *proletariat*, ardent in its new faith, were the best guarantees for the success of socialism. For two years this state of affairs continued, and Italy witnessed the novel spectacle of a vast political association held together by discipline, free from the bonds of secrecy or conspiracy. Out of the ranks of the *bourgeoisie* came many brave men who raised the banner of revolt against existing conditions. Cesare Lombroso, the great pathologist, Enrico Ferri, the eloquent orator and famous jurisconsult of the new positivist school of criminology, joined the socialists. They were followed by philosophers, poets, scientists, and economists, in large numbers.

The Congress held in Reggio Emilia in 1893 was an apotheosis of the socialism that had vindicated the rights of the agricultural classes of North Italy, but—it was also the last action of the socialist party which was not opposed by the *bourgeoisie*. Before the end of this year there were famine riots in Sicily, echoed also in Continental Italy. They were the inevitable consequences of the hunger of the people and the oppressive taxes. But the rioters were led

by Socialists, and often socialist cries were used, hence repression took the form of war on socialism; the Statuto (Constitution) was violated and administrative deportations instituted and freely applied to political agitators, liberty of the press was abolished, and by means of seizure of documents, and lists of members, and imprisonments, the party was for the time suppressed. But because this extreme violence was instigated by the unpopular *bourgeoisie* and carried out by a Ministry already discredited by the Bank Scandals, the Socialist party was not vitally injured. In January 1895, at a secret Congress held in Parma, the party altered its constitution and assumed the name «Italian Socialist Party,» and in the ensuing general election polled 80,000 votes, secured additional parliamentary seats, and compelled the passing of amnesty laws which brought security and tranquillity. At the next Congress, held in Florence, the direction was transferred from Milan to Rome, the seat of government and the place most suitable for political propaganda, and it was also decided to publish a daily paper, *L'Avanti,* which could carry on the propaganda in a field not reached by the 40 or 50 existing weekly socialist papers. In the general election of 1897 the socialist vote increased to 130,000 and in the congress of this year held at Bologna the intransigeant policy was definitely rejected and it was agreed to ally themselves with other democratic parties in opposition to the common enemy—the Conservatives. The party seemed on the highroad to prosperity. But,—there was a but.

Never has the desire either for personal, civil, or religious liberty sufficed to rouse Italians to rebellion. Liberty has either come peacefully or else as the result of conflicts for other ideals, such as the conflict for Italian unity and independence of foreign control. Public opinion naturally favors liberty—it is there and it is convenient. But because of a racial scepticism and excess of philosophic resignation, when this liberty is lost the sacrifice is endured. Italians are easily aroused, they no less easily forget, or desire to be left in repose. Hence the socialistic party, which in public meetings lifted its voice, in strident propaganda and noisy warfare, was a disturber of the peace, a mischief-maker to the *bourgeoisie,* who welcomed an opportunity to destroy it. This opportunity came in 1898. For several months previously the socialists had been speaking against the customs duty on foreign wheat and flour which enabled the incompetent farmers of south and central Italy to pay starvation wages to the oppressed peasants, but which intolerably raised the cost of bread to the poorly paid industrial workers in the cities. This price of bread was still further increased in 1898 by the previous year's scanty harvest. Street tumults ensued which might have been avoided by the temporary reduction of the duty on foreign wheat. Martial law was almost everywhere proclaimed, and penal servitude was the frequent sentence pronounced by military judges. Members of parliament and journalists were condemned to prison and exile, archives of socialist associations were destroyed and the funds of coöperative societies seized. The blow to socialism seemed mortal.

The government soon realized that this severity was not approved by public opinion and martial law was revoked; administrative deportation for political offenses ceased, and amnesty was granted. But though the government, repenting its leniency, asked from Parliament laws restricting the right of association and liberty of the press, the socialist leaders on leaving prison and returning from exile renewed their agitation and inaugurated the first obstructive tactics ever attempted in an Italian Parliament, compelling a dissolution. This Parliamentary revolution marks a historic event.

In the general elections of 1900 the Ministerial candidates received only 611,425 votes. Of the different opposition parties, the Monarchists received 303,891, Radicals 110,208, Republicans 119,645 and Socialists 251,841 votes. The Socialist vote had doubled in less than three years and the Socialist members of Parliament had increased to thirty. As soon as Parliament met the Conservative Ministry fell, and was succeeded by the Zanardelli-Giolitti coalition cabinet under which the Socialist party had such triumph, such influence and. . . such dissention. Together with the Republicans and Radicals they formed the *Estrema Sinistra,* whose support was indispensable to the Ministry. But though when in the minority these components of the *Estrema Sinistra* showed ability and power in harassing the Government; when, as a part of the majority supporting the new Ministry they attempted to pass from destructive criticism to constructive legislation, they showed pitiful inaptitude and quickly developed dissentions. Thus originated that crisis under which the Socialist party is still laboring.

The intense individualism and impatience of restraint inherent in the Italian nature must always be reckoned with in Italian political parties. No sooner is an Italian Cabinet formed, no sooner does an Italian political party become powerful, than distrust and jealousy enter in, and the process of disintegration begins. Though the strike in the mine districts in 1901 was largely successful and greatly increased wages and though the railway employes in 1902 by threatening strike, obtained their demands, and though every dictate of prudence suggested that the socialist party should unite in support of the Zanardelli-Giolitti cabinet, they quarreled among themselves. Enrico Ferri became the leader of the Socialist malcontents. The dissenting faction refused financial support to the socialist newspaper *Avanti* because it supported the Ministry, and the director of that paper, Leonida Bissolati, resigned. Enrico Ferri immediately took his place. This division within the party was really a personal rivalry between leaders. The moderate socialists were defeated in the Bologna Congress of 1904. In vain did they point out that the *bourgeoisie* had recovered from panic and could now fight their battles without government support. In vain did the moderates urge that the party rest content with a program of gradual reform. But the revolutionaries would have none of this. Bloody conflicts with the police broke out in South Italy followed by a general strike all over the country, which soon degenerated into deplorable excesses. As a consequence, at the

next general election the Socialists lost several parliamentary seats, and in the strike of railway employes in 1905, promoted by the revolutionary group, the strikers were entirely defeated.

In consequence of the agitation resulting in this defeat of the railway strikers, the more belligerent faction of the Socialist party adopted the latest conception of French socialism as presented by Sorel, known as «Sindicalism.» Such conception implies that subordinating the purely political agitation, the proletarian movement should become a vast association exclusively confined to workingmen and rejecting assistance from «the classes.» Sindicalism expects the working class to actively oppose both capitalism and all government favorable to capitalism. This sentiment of Sindicalism became stronger because it was a protest within the party against the alliance of Enrico Ferri, and the Ferrists with the Sonino Ministry which rose and fell in March and April 1906. The situation became intolerable and a national socialist Congress was called in September 1906, to discuss the situation. In this Congress it was discovered that the Reformists and the new section of socialism, calling itself «Integralists» were equally averse to the revolutionary policy of trades unionism advocated by the Sindicalists. The newspaper published in Rome by the Sindicalists (*L'Azione*) violently attacked the party organ (*L'Avanti*), while the Integralists and Reformists in combination defeated the Sindicalist policy of trades-unionism. As this active opposition to Sindicalism by the leaders in control of the Socialist party continues, the official separation of the Sindicalists from the Socialists cannot be long delayed. The present flourishing condition of Italian industry and commerce undoubtedly hinders the spread of socialism, and soothes the asperity between capital and labor. It will also be difficult for the Socialists to make political headway against the present Ministry, at the head of which is one of the most clever statesmen which Italy has ever produced, Signor Giolitti.

But this very amelioration of the condition of the Italian working classes, tends to enlarge the range of their necessities and accustoms them to a higher standard of living. This results in the institution of coöperative associations and leagues for mutual assistance. The Italian proletariat will never consent to a return to former conditions of privation, but will insist on still greater material comfort and less labor, and a larger share in the nation's wealth. The struggle to secure these things will probably be led by the Socialist party, and in the coming conflict, the opposing capitalism and conservatism will probably continue to be less compactly organized and less capable of strenuous resistance than in England and Germany. Probably the first contest will be against that latest Italian party, which calls itself Catholic or Clerical. At the present time (1908) socialism in Italy possesses seven daily papers, one hundred weekly, and thirty professional periodicals. The number fluctuates and the circulation of some of them is extremely small.

JOSEPH SPENCER KENNARD,
Author of 'Italian Romance Writers,' etc.

14. Italy—The Italian Army. The Italian army follows the political movement of the nation. As the various regions of Italy were united in a short space of time to Piedmont, so all the military forces of the other States of the Peninsula united themselves with the military legions of this little kingdom.

It was necessary, however, to combine in one organization all the various little armies with their diverse systems and laws, and we have an instance of this in the action of the illustrious General Fanti who adapted the French troops to the needs of Italy.

The basis of Fanti's system was compulsory military service by which all citizens between 20 and 39 years of age were compelled to serve in the army—in the line for the first few years and later on in the militia.

Another characteristic of this regulation was that each regiment should be drafted not from one special region, but from various parts of Italy. In this manner the provinces of the kingdom would not feel that they were being matched one against the other, and the provincial spirit would make way for a greater national spirit.

Fanti's system remained in force for many years, but it is now deemed advisable that each regiment should recruit its forces from the citizens who reside in the neighborhood of the army at the commencement of hostilities. The examples of the War of 1870 indicated the need of important changes in the military systems, and General Bicotto provided for these by modelling the army, as much as possible, on the Prussian system, reorganizing special departments of the army, requiring greater education in the officers, and facilitating mobilization and creating the bold Alpine regiments which are to be stationed on confines of the kingdom to defend its borders.

Subsequently, through the efforts of Generals Mezzacapo, Bavel, Marselli, Milon, Cosenz, and above all, General Luigi Pelloux, the government saw that imitating foreign military systems would not suffice for the defence of a nation, but that every nation should have some military characteristics peculiar to itself. Hence arose the present military organization of Italy, by which the principal strength of the army is in the infantry, to which are subsidiary a great number of cannon and a well disciplined cavalry.

The Italian army, therefore, is composed of 12 army corps, each of which has military jurisdiction over a limited territory.

Seven Alpine regiments are stationed in the Alpine Valleys. Two regiments of grenadiers are stationed in Rome, 94 regiments of infantry of the line are scattered throughout the whole kingdom. There are 12 regiments of sharpshooters, who form a special infantry with purely Italian characteristics; their record is world-wide; in them live the traditions of the Crimean War, and it is to the credit of General Lamarmora that he gave to Italy such a noble contingent. And as for its sturdy soldiers, speeding like arrows, their plumes flying in the wind, they pass in review before the people, who feel that their hearts beat in union with their strong defenders.

All the regiment of the line have either at

headquarters, or as near as possible to where they are stationed, a base of supplies. Each regiment has 12 companies, with three battalions of four companies each.

The artillery is composed of 24 regiments, part of them stationed through the country, part of them in the fortresses. There is a regiment of mounted artillery, and one of light artillery. The introduction of rapid fire cannon will probably change the artillery organization. Besides the five regiments who furnish shoemakers, miners, machinists, and bridge builders, the engineer corps, supplies, officers, and soldiers for the telegraph and telephone service, for the setting free of carrier pigeons, for the management of balloons, and for every special mechanical and chemical need required by a well-organized army. The 24 regiments of cavalry that the Italian army now possesses have each special and distinctive stripes, the headgear (Colbacco) special to the light cavalry, the helmet for the lancers.

The instruction of the cavalry is with a view of making it an active factor in an unexpected attack or in routing the enemy already scattered by the fire of the soldiery, and to detach the reconnoitering service to the van of the army.

The problem of horse supply for the cavalry is a difficult one for Italy, hence she is obliged to limit the number of her cavalry. The cavalry officers are excellent horsemen. At the head of small bands of soldiers, they traverse the most rugged portions of the country, climbing its mountains and dismounting promptly ready to attack in places which seemed inaccessible.

It is owing especially to Inspector General Majnoni (who was Minister of War during the administration of the Honorable Sidney Sonnino), that such a practical direction was given to the instruction of the Italian cavalry. All the professions are represented by the army; thus they have physicians, veterinarians, commissaries, accountants, all invested with a certain military rank, of varying degrees.

The 12 legions of Royal *Carabiniere* are an important factor in the strength of the army. These besides being the most perfect body of police known to Europe, rendered eminent service in the national defence and took an honorable part in all the wars of Italian independence.

As we have seen the regiments of the line consist of 12 army corps, which may be augmented if necessary by other corps recruited from the military reserves.

There is a regulation that in time of war the 12 corps shall be subdivided into several divisions.

Every army corps consists of two divisions of infantry, and has besides a proportionate number of cavalry, artillery, and engineers, a commissariat department, a department of health, hygiene, munitions, etc.

These divisions consist of two brigades of infantry, provided with cannon, balloons, and the departments that are strictly necessary for the troops. There are also some independent divisions of cavalry. Each infantry brigade is commanded by a major-general, and is composed of two regiments.

The work of the levy, or annual conscription is entrusted partly to the civil authorities (mayors and prefects) partly to military districts.

The military district is, in fact, the bond of union between the people and the army. It holds the register of all enlisted men and soldiers on unlimited furlough. It notifies them by police proclamation of the call to arms, subjects them to medical examination, and distributes them in the various corps.

The annual contingent of recruits amounts to about 500,000, from which must be deducted those that are disabled by physical ailments, by various objections, and by family reasons, and this leaves only about 100,000 enlisted men a year. The enforced military service, that is the time during which a citizen, in time of peace, must serve in the army, varies from a minimum of 10 to a maximum of 34 months, and taking into account the loss by sickness or other causes, we see that the average strength of the Italian army in time of peace is 215,000 men.

A cause for exemption from military service, other than a specific malady or reason for unfitness specified by the law, is the fact of a man being an only son, of having had brothers who have borne arms, of being the support of his own family or of his nearest relatives. Thus it is seen that the flower of the nation is called to defend the country, for they require in the ranks a number of men of robust constitution and good morals.

There is at present before the parliament the draft of a law that has for its object a diminishing of the time of the enforced military service, and to increase the annual conscription to 120,000 men. In time of war it may be estimated that the regular army can place more than half a million men in the field, in addition to 200,000 militia (*milizia mobile*), whilst the Territorial Militia and the Communal Militia defend certain portions of territory and maintain public order. With the view of making Italy a military nation and diminishing the burdens of the army, the *Tiro a segno Nazionale* was instituted, so that young men could practice sharpshooting (firing at a mark), and other important warlike exercises.

The government contributed 600,000 lire to initiate this patriotic institution, which was so warmly advocated by Garibaldi, and which is destined to develop greatly in the future. As it is evident that every war in Italy will be carried on most bitterly in the northern regions, the chains of the Alps, Ligurian Apennines, and the Riviera of Genoa and Venetia were covered with fortifications, which have been extended from year to year. It is estimated that in a very short time the whole army of the line can be ready for war, and the railroads, which are now under government control, with improved transportation, will render mobilization more easy than it has been in the past.

The rifles of the infantry (1890-91 model), are of small calibre, with long, rapid discharge, and are one of the best weapons known. There are in process of construction steel cannon of 75 millimetres calibre; these cannon, which can be dismounted, are considered the best in the world, even superior to those in use in France.

The baggage of the soldiery is still somewhat heavy and cumbersome, and an endeavor

is being made to modernize it. Generally speaking all the munitions of war are constructed in the arsenals, laboratories, and foundries of the State with military organization.

The officers are trained in appropriate military schools—the infantry and cavalry in that of Modena, the artillery and the engineers in the military academy of Turin, and in order to enter these institutions one must pass a special examination and have obtained a high school (Lyceum) certificate.

The complementary officers, *i. e.* those young men who serve only in time of war in subaltern capacities, are taken from the one-year volunteers, or those recruits who belong to the professional class and being devoted to serious studies are permitted to serve 12 months only, in time of peace.

The cavalry, before taking service in a regiment, are obliged to take up a special course in the Pinerolo School; the artillery and engineers must pursue their studies in the Technical School at Turin. There is, besides, at Parma, a school where the infantry officers perfect themselves in the study of their profession.

As it was extremely difficult to diffuse military instruction in the art of command, there was established in Turin the «School of War» that has a large attendance, as its students have special advantages for the pursuit of an army career, and many even aspire to a position in the *Etat Majour.*

The general expenses of war comprise those of the Royal Carabineers, and of the military pensions, amounting to about 180,000,000 lire, and added to this the extra expenses, and it may be estimated that within a few years this will amount to about 300,000,000 lire.

The Italian army which we have thus broadly described has not yet tried its strength in a great European war, for in 1866 it had only initiated its present organization, in 1870 only a small portion of it undertook the occupation of Rome, and in the Colonial Campaigns its strength was not proved as a whole, but it was represented by a small portion of the army, hastily mobilized.

But if on these particular occasions it had no way of putting all its machinery to the test, that did not prevent the special attribute of its officers—bravery—and the excellence of its soldiery from being recognized. In the unfortunate battle of Adua a few thousand soldiers knew how to resist an innumerable horde of Sciyans and Abyssinians, and the acts of valor they performed excited the admiration of Europe, and the death of so many heroes, a Toselli, a Galliano, an Arimondi, and a Dabormida gave Italy the right to raise her head proudly on the field of defeat.

The people are proud of their army, for they behold it ever ready to march into danger, ever ready to come to their assistance; in the cholera year in Naples; in the serious inundations of the Veneto; in the earthquake of Liguria and Calabria; in the disaster of the volcanic eruptions, always and ever the Italian soldiery fraternized with the people, and endeavored to the best of their ability to aid them in their misfortunes, thus demonstrating that not alone in war may an army filled with noble sentiments be of benefit to its country.

In 1906 the war strength of the Italian army was: Officers, 43,632; non-commissioned officers and men, 1,942,560; guns, 2,660. The peace strength was: Non-commissioned officers and men, 258,632; guns, 1,460, exclusive of reserves of active army, first and second reserves and fortress guns.

General Fortunato Marazzi,
Member of Parliament, Formerly Secretary of State for War.

15. Italy—The Naval Marine. The confirmation of the Italian Unity as an accomplished fact is coincident with the feverish anxiety that manifested itself in all the European countries in the great transformation that occurred in the Marine Service through the change from sailing vessels to steamships. At that time there was going on in Italy a complete reconstruction and reorganization, not only of the materiel, but also in the personnel—especially of the officers.

Officials.—In 1859-60 there existed in Italy only the Sardinian and Neapolitan Marine, for the other states of Italy had no marine. The great diversity in the general management of these two navies, the difference in ability and culture in the superior officers—who were conspicuously superior in the Sardinian Navy—caused a decided lack of that harmony which is one of the essential factors in union. It was deemed necessary to combine the two naval schools of Genoa and Naples; and Leghorn was selected, in a region that might be called neutral, as the site of the new Naval Academy. The highest results were obtained in every respect in this institute, for thanks to a critical and careful selection of students, it produces today officers who will bear comparison with those of any navy in the world.

Equipment.—Until a few years ago Italy possessed a flourishing Merchant Marine of sailing vessels, from which were taken a number of the best officers for the Naval Service. The excellent seamanship of the Ligurian sailors was so well known that they were sought by foreign navies. But after the change from sail to steam, and the consequent diminution of sailing vessels, the large number of sailors on all the Italian coasts, and especially on that of Liguria, gradually diminished.

The great dockyards for construction, steel works, and industrial establishments of all kinds, arose in the course of a few years, as if by enchantment, on the two sea coasts of Genoa, and they have caused a fruitful and vigorous awakening of the energies and economic resources of the country. But they have absorbed for the most part the better elements, which, according to ancient tradition, were owing to the marine life.

At the present day, the supply of seamen is not equal to the demand, and the State supplies the deficiency by voluntary enlistment, until the next levy in six years' time. The personnel thus enlisted consists mainly of the special branches of the service, and particularly gunners and torpedo men.

The Italian sailors are not given by nature or custom to the indulgence in wine and liquors, and they have the well deserved reputation of being well disciplined, sturdy, and of being able

to endure an exceptional amount of fatigue. The descendants of the old Greeks, who colonized the coasts of Calabria and of Sicily, are to-day the best element in the manning of the Italian Navy.

The inhabitants of the Coast of Calabro-Ticula have been fishermen from their infancy. Accustomed to all kinds of fatigue, and to every sort of weather, sober as anchorites, they pass their lives with an oar in their hands, thus tempering the muscles of their arms and chest, as the steel is tempered in the fire. And it is this valuable element which accounts for the brilliant victories constantly gained by the Italian seamen in the international regattas over a long course, as in the regatta at Shanghi in 1905 between a vessel of the Italian Navy, *Marco Polo,* and one of the so-called strongest vessels of the American Navy.

Unfortunately, owing to the demands on the naval exchequer, the pay of the men is wretchedly small, and for that reason very few remain in the service after their obligatory term expires. This is a very serious inconvenience, especially where gunners and torpedo personnel are concerned, for they require a long and expensive course of instruction. Consequently, there is at the present time under consideration and in the process of application, a movement to improve the condition of subordinate officers and the specialized personnel, to induce them to continue in the service. Special attention has been given to the instruction and selection of gunners, and the splendid results in firing cannon evidenced in the naval exercises that took place October 1906 go to prove the remarkable progress that has been made along that line.

Armament.—At the time of making the change from sailing vessles to steamships, the industrial production of Italy was so limited that she was obliged to have recourse to foreign industry, and to France in particular, both for the building of ships and for the manufacture of armor. But a few years of active work were sufficient for the shipwrights to transform themselves into the best kind of iron workers, and the government arsenals obviated the need of recourse to foreign manufacture, and they were able to build and equip through their own efforts the present day armored men-of-war. Flourishing private dockyards were established to compete with the government manufacture, and in the last ten years the naval industry of Italy has been able to sell to foreign countries a considerable number of armored vessels, and to take orders for several others.

Steel Works.—Government production is for obvious reasons more costly than private production, and in order to expedite Italian emancipation from foreign industries, also in armored vessels, the Italian Government has made provisions favoring the establishment and development of the large steel plant in Terni, which is now in such a condition of efficiency as to produce on a large scale the highest grade of armor. Unfortunately, this private concern is the only one in Italy, and secure of its monopoly it has sought to raise its prices to the highest mark. This has determined the Government to give their latest orders for armor-plate to foreign shipbuilders, the Italians being outbid by foreign firms. There is also a plan to establish government steel works to check private avarice.

Present Conditions of the Italian Navy.—About 20 years ago the Italian Navy held the third rank as a naval power among the principal nations of the world, but heavy financial responsibilities had diminished the exchequer considerably just at a time when the other continental nations were awakening to the necessity of increasing their maritime power and directing all their efforts to the development of the navy. And thus it happened that in the course of a few years the Italian Navy retrograded to the seventh rank. But the marvelous progress in industrial commercial activity gives hope that before long there will be an improvement in this respect.

The period of economy in the war department added to a policy of retrenchment on the part of the government have not failed to bear fruit, for at present the national budget shows a period of increased prosperity and the naval exchequer including the special departments has attained the considerable figure of one hundred and forty millions of lire. It is true nevertheless that with this annual expenditure Italy might hope for a greater condition of efficiency in the navy, than exists at present; for the Austrian Navy with an expenditure which is to that of the Italian Navy as one to three, has at its disposal a naval force in the proportion of 1 to 1.15. This disproportion is, however, partly owing to the enormous number of government arsenals existing in Italy, the products of which are very costly. For territorial reasons it has been impossible hitherto to close some of these arsenals, but it is probable that in the near future some provision will be made towards this end.

The Italian Navy in 1906 consisted of: First-class battleships, 9; second and third-class battleships, 11; coast defense ships, 4; armored cruisers, 7; other cruisers, 32; torpedo boat destroyers, 19; torpedo boats, 141. Officers, 1,560; men, 25,800.

Thanks to the enormous amount of one hundred and fifty million of lire ($30,000,000) appropriated in 1905, the Italian Navy will have at its disposal in a few years 24 ships of the line (battleships and armored cruisers), and about 80 modern torpedo boats; and the wholesome awakening which in the latter time has come to the whole of Italy, in regard to the vital importance for her of a powerful navy, gives assurance that she will not spare attention and sacrifices in order to attain a naval efficiency, which shall be equal to the exigencies and the just political and commercial aspirations of the nation.

COUNT CANDIANI,
Admiral of the Royal Italian Navy.

16. Italy—Religion in Italy. To represent the present state and condition of religious life in Italy is a difficult matter on account of historical and ethnological considerations, and those who have tried to explain this religious life have given expression to the most varied and opposite opinions on the subject. There are some who say that in Italy there is not now and never has been a true religious spirit, but on the contrary a constant and universal indifference; that

the official religion and the rites of the Roman Catholic Church are nothing but a travesty of pagan ceremonies; that everything in worship is external and superficial and is a reflection of the sentiment of classic art, and of the political traditions of the Latin races. They say that the Church is a Christian embodiment of the Roman Empire, and of that instinct of government and of domination which Virgil immortalized in a memorable verse.

On the other hand, some maintain that there has always been a current of mystical inspiration through the ages of Italian history, together with the official religion; that evolutionary Catholicism has in Italy as large a following as elsewhere. This is evidenced by the interest aroused by the condemnation of Loisy, Bonomelli, and Fogazzaro; and that Christian Democracy, notwithstanding its recent condemnation by the Pope, still retains the same vitality as was shown during the pontificate of Leo XIII.

The famous formula of Cavour seems to necessitate the absolute divorce of Chuch and State; and the indifference of the State to all that concerns the religious conscience of the Italian people is undoubted.

In France the rupture of the concordat and the subsequent anti-religious proceedings of the government threatened to lead to an open conflict between the Church, jealous of her prerogative, and a government which was not only secular but even hostile to religion. In Italy, on the other hand, the secular sentiment of the government is indifference to all that concerns religion. Religious neutrality has been converted into religious annihilation.

This attitude of careless indifference induces political weakness, and is the cause of serious difficulties for the government, as well as for the Italian people.

The problem of divorce is one of many questions in regard to which the instability of our ecclesiastical polity is a source of danger to the country. There are also serious difficulties in Italy's international relations, especially with the heads of Catholic governments. Notwithstanding the Law of Guaranty the relations between Church and State still remain indefinite on many points. The responsibility of the ecclesiastical authorities for the care and protection of the works of art which everywhere adorn the churches has never been defined by law; religious instruction is imparted in the schools in some communities, while in others it is excluded. This confusion will result in obliging the State to take charge of the primary schools, owing to the fact that the government never took a firm stand on this problem.

The danger to public morals and to the family life of the citizens is still greater, on account of the uncertain relationship between civil and ecclesiastical marriages; and although there was a discussion in the senate a few years ago about the draft of a law advocating the precedence of civil marriages, matters remained as they were before, the senate relying on the old maxim, «Let sleeping dogs lie.» But in this case there can be no rest. As the clergy frequently perform the religious ceremony of marriage when there are previous obligations and liaisons, cases of civil concubinage are frequent, and there is no way of preventing eventual desertion. This deplorable state of affairs, equally lamented by both parties, can only be remedied by conquering the hostility to civil marriage; an unjustifiable hostility because in its religious aspect the sacrament with its solemn character would give the final sanction to a contract founded chiefly on personal interest.

For the Italians who have the artistic instinct and a taste for external display, ceremonials are living and substantial things, and not mere superficialties, as the Catholic Church knows well.

The difficulties created by this state of affairs is also felt by the Church itself. The Italian government has never shown by its actions that it understands the benefit that modern Italy would derive from having the support of the inferior clergy, particularly the clergy of the rural parishes.

Against the inflexible hostility of the higher ranks of the priesthood the government would have found a powerful ally among the inferior clergy for the reason that they are closer to the people and could attract them to their side in a thousand ways, thus resolving in a simple and practical manner the problem of elementary instruction—at least in the rural districts. The county parish priests and the curates in small cities are in a painful position as regards the civil authority, and more than one «Don Abbondio» would consider it a blessing to see the King and the Pope at peace, and the throne and the altar reconciled.

As the separation of the two authorities may explain, if it does not justify the indifference of the Italian government to all questions pertaining to religious and ecclesiastical polity, so the heated political discord after the occupation of Rome, confounding politics with a question of faith, gave a seeming excuse to the irreligion of many political men, and under the guise of a kind of patriotism condoned their frequent attacks on the interests of the Church, and at the same time constrained the great majority of Catholics, even to this day, to refrain from participation in political life, thus robbing parliamentary life of that rich interchange of ideas which would doubtless have restored its prestige which had sunk so low in the estimation of the public.

There was in truth a party widely diffused throughout Italy who sought to adjust the painful breach; and at one time—in 1887—it appeared as if a reconciliation would take place through the action of a number of persons whose representative was Father Tosti, and who believed it possible to be good citizens as well as good Catholics, to love and serve their country and yet to be devoted to the Church. But although there was no doubt of the advantages that the Italian government would derive from the new order of things, especially as civil liberty and the unity of Italy had always been an intangible possession, it was just as manifest that the Vatican could never officially withdraw its solemn and repeated declarations. Nevertheless experience has shown that a *modus vivendi* is not only possible, but that a silent renunciation has already taken place. It was so manifest that the fall of the temporal power had no evil effect on the spiritual power of the

Church; and the impossibility of a *restitutio in integrum* was so evident that the younger and more cultured clergy felt that there was a renunciation, and an implied understanding. The fact that the younger Catholic party, in accord with the encyclical of Leo XIII. *Rerum Novarum,* had entered into economic and social action as the *Christian-Democratic party,* signifies that a larger field was opened to their activity, and that the policy of revenge was abandoned.

It is true that the new pontiff hastened to restrain the impetuosity and curb the ardor of the young Christian Democracy; but while not revoking the *il non expedit* he himself agrees that the Italian Catholics shall take part, wherever it seems advisable to the local ecclesiastical authorities, in all political elections, and shall sit in the parliament at Rome. This attitude is a tacit recognition of Rome as the capital.

Thus it is that to-day the political question cannot excuse indifference on the part of sincere Italian patriots to the Church and to religion, as it could 30 years ago when the Roman question arose, and continued and violent protests were heard from the Vatican. With the deprivation of its temporal power, the pontificate, even in the eyes of Protestants and Freethinkers, has gained in spiritual authority and acquired a certain dignity. For that reason today the conditions are more propitious for a religious revival than it was ten years ago. The «Bank Scandals,» the corruption in many branches of Italian public life, and the more recent acts of violence, such, as in Florence when the iconoclasts of the extremist party induced a feeling in the minds of many that Italy needed, if not religion, at least a moral regeneration. Many public men of the new generation believe that it is not incompatible with their patriotism to give a religious education to their sons, and feel that the worship of patriotism and of liberty alone cannot satisfy all the needs of the soul and of modern life.

Thus there originated a moral union, which was initiated in Rome in 1894 by a group of chosen men as a result of the lectures of Paul Dejardins and in imitation of the Societies of Ethical Culture started in America, Germany, and other countries by Adler, and which are still active. Notwithstanding their noble efforts, the work of this Italian society was not a success, and the journal *L'Ora presente* («The Present Hour»), which was the organ of this praiseworthy society, although well conceived and edited in a liberal and enlightened spirit, did not succeed in revivifying and renewing the public spirit of the country, and was short-lived.

On the other hand, every attempt to reconcile the Catholic Church to the modern movement of ideas seemed to be futile. As regards its relations with international culture, whether in the line of thought, or of social life, it has that tendency to fortify itself behind the rigid inflexibility of dogma of authority and discipline at the least breath of modern thought, more especially in the land where it has its historical seat and centre of power.

The Roman Catholic Church, for long centuries marched with the times, and it had that marvellous power of adaptation which enabled it to survive the wreck of many empires, to hold its own amid varying events, and to issue victorious from the treachery of foes within and the persecution of enemies without its fold. In its apparent immobility, it progressed in doctrine and in action. The *nil immutetur in ecclesia* was rather a rule of internal discipline than a precept of its active life.

She welcomed the culture of ancient Rome and the political traditions of the empire. With that good sense that characterizes the Latin race and which was her strength, she knew how to gain advantage from the uprising of the orders of mendicant friars in the 13th century. Of the teachings of Aristotle she made the foundation of her philosophy, and in the humanitarian period welcomed Platonism. Under the name of culture she knew how to make use of the classical Renaissance through the *fine arts,* raising them to the magnificence of the Vatican chamber, and to the Sistine Chapel. This regeneration culminated in the Council of Trent.

It seemed as though its power of adaptation and assimiliation had been exhausted in that effort and the secular evolutionary tradition lost. The Church from this time smothered every live movement of free thought, although consenting to the work of literary and historical learning and—where they did not touch on dogma—the physical sciences. She would not affiliate with the three great movements of the 19th century—that of Italian national liberty, the socialistic movement, and the modern scientific movement. After the vain hopes of 1848, the Church contrasted the Unification with the Freedom of Italy, and if Leo XIII. in his encyclical *Rerum Novarum* appeared to arouse the Church to new social action, his succeeding encyclicals, and those of Pius X., discourage the Christian Democracy, thus extinguishing all socialistic vitality in the younger clergy and the Catholic laity. It was the same with the sciences.

It was certainly a great benefit to the students of history when Leo XIII. opened the archives of the Vatican, and that the Italian clergy have taken a notable place in the work of scientific laboratories. But as the Holy See and the doctrine of papal infallibility closed the door on all independence of thought, it was natural that philosophy should also be officially proscribed by the Church, and thus, by the act of Leo XIII. the scholastic became the only true and sane philosopher. We hope that it will not be the same with biblical criticism, and that the commission selected by Leo XIII. (in many respects liberal-minded men) will not risk the suppression of enlightened biblical study, of which the younger Vatican clergy have given praiseworthy examples.

However, the news that they have found a dogmatic confirmation of the Mosaic origin of the Pentateuch makes one fear that even in this respect she desires to close every channel to modern criticism, as was done in the condemnation of Loisy, in the retraction imposed on Mgr. Hulst and other liberal, energetic Catholics. Just so in the recent condemnation of Bonomelli, of Fogazzaro, and his novel 'The Saint,' and of Christian Democracy it is seen that the restrictive and irreconcilable attitude still obtains in the bosom of Roman Catholicism

towards every movement for freedom of thought.

Notwithstanding all these signs of rigid adherence to the central traditions of the Catholic Church, there is a noteworthy revival of religious life if not in the Church, at least all around it, in Italy. For this reason what Harnack wrote some years ago is not exactly true to-day—that Italians were two extreme poles, Papistry and Atheism. He did not know that there would be many Italians who would consent that Italy should to-day be at the head of the movement of religious reform in the Catholic Church, as Harrier Reid affirmed in reviewing Fogazzaro's ideal works (*Monthly Review*, Sept. 1906). It is not a question, if it ever was, in Italy, of a vague and unorganized aspiration. This is something more, and if the *Will to Believe* is not quite religious, it is nevertheless, as Nietzsche declares, not a negation; and there are not wanting among us signs of the need of a renewal of faith, or at least of a greater regard for religious matters.

Little or nothing can be hoped for from the government in this respect, as long as the political relations between it and the Church continue to be strained, and as long as the traditional policy lasts of abstention from all that concerns religion. The State could never be favorable to religious instruction in the schools by the clergy, who might educate subjects as rebels, or traitors. On the other hand, the general lack of theological culture among a cultured laity, especially after the abolition of the theological faculty in the university, may lead to a consideration of a serious and effectual form of instruction. The *bourgeoisie*, of which the government is only a reflection, is saturated with Jacobinism; and Italian liberalism is not only legitimately anti-clerical, but also anti-religious. The government, liberal and non-religious as it is, and should be, has never appeared to be aware of the social and political value of the religious life among the people that it governs, and of the great truth taught by history—that religion is the strength and the beginning of all national life.

In addition to all this we must remember that what was called the Popular Party in Italy, and more especially the Radicals and the Socialists, were at least the indirect supporters of each ministry, which, without them could not have long remained in power, and that they brought into Italian public life the most determined opposition not alone to the Church, but also to all religious matters; and their words were assiduously propagated among the people as the words that would free them from that religion which they looked upon as the traditional stronghold of authority and of the ruling classes. We notice, besides, that in science—official science, so to speak—in Italy, positivist theories and tendencies still generally prevail, whilst in more cultivated countries they have lost ground, as might be seen at the Congress of free thought held in Rome three years ago.

There is not much to be hoped for from the action of other religious bodies in Italy. In spite of the multiplication of evangelical centres and literature, especially the Waldensian, they remain only isolated instances, and the entrance of Protestanism into Italy meets with the same opposition to-day it encountered in the time of Luther. The nature of the Italian race which demands in addition to the religious sentiment the satisfaction of its vivid imagination and of the classic sense of beauty and of ceremonial form, is foreign to the inner spiritual individuality of the religious life, peculiar to northern races; it loves the association and social union of souls united in a common worship and solemn and magnificent rites. The enthusiastic words of Mortimer in Schiller's 'Marie Stuart' represent better than anything else can the Catholic sentiment for the arts, and the conservative value of external rites, as also do the words of the Catholic queen, herself, in the prayer she offered before her last confession:

"Es hasst die Kirche, die mich auferzog,
Der Sinne Reiz, kein Abbild duldet sie,
Allein das koerperlose Wort verehrend.
* * * * * * * * * * * * * * * *
Die Allgemeine, die Kathoi'sche heisst sie,
Denn nur der Glaube aller staerkt den Glauben
Wo Tausende anbeten und verehren,
Da wird die Gluth zur Flamme, und befluegelt
Schwingt sich der Gelst in alle Himmel auf."

Nevertheless, whoever should deny that there is a breath of religious life in modern Italy would be greatly mistaken. The discussions raised by Fogazzaro's book, especially since his condemnation by the Church, were not owing to the literary value of the work, which is but slight, nor to his acknowledgment that he had not the courage to retract, but to the idea formulated in the book of a reform of the Church. It is true that the promulgation of these ideas are limited to a group of cultured persons, and it is not to be expected that a successful move for religious regeneration can extend to the people from that source. Then again, the sympathy for «Francescanism,» whence arose the society of Saint Francis d'Assise, founded by Sabatier, is more historical, erudite, and artistic than religious. The true religious movements always originate in the minds of the common people.

We must distinguish between the operative masses of the cities, agitated by the irreligious propaganda of socialism, and the rural population among whom the religious spirit is a living reality. In the southern part of the peninsula and in Sicily, particularly in the rural districts, religious belief often becomes dense superstition. An idolatry of saints and images, a belief in signs, omens and fetichism rules the life of the people, sometimes accompanied by vicious customs, and personal violence. Centuries of poverty, illiteracy and oppression account for this in part; but the oriental character of these mixed races chiefly accounts for the frank sensualism, vivid imagination, intense emotionalism, impulsivity, semi-pagan worship of beauty and gorgeous ceremonial, and blind belief in Fate, which characterize their religion. Increasing education and better economic conditions will gradually alter all this; and even now those who look beneath the surface will discover much ignorance and simple virtue sustained and comforted by faith, by acts of abnegation and by admirable self-sacrifice. These are, of course, less *en évidence* than the more numerous social crimes and acts of violence; but they are there, as a source of inspiration and a guiding influence. In truth, this popular religious influence, especially en-

during in the rural districts, is like a groundwork formed by the old current mysticisms which, in times past, created in Italy an original form of sentiment and of religious consciousness.

Italy gave to Christianity Saint Benedict, and Saint James of Fiori, Francis Assisi, and Catherine of Siena, Savonarola and Saint Bernardino, Philip Neri and Carlo Borromeo. And from religion was drawn the inspiration that prompted the works of those «Spiriti Magni.» Dante and Giotto, Fra Angelico, and Petrarch, Brunellesci and Columbus, Michelangelo and Tasso, down to Rosmini and Manzoni. Now the popular form of Christianity—that of Francesco d'Assisi—is a purely original and national form, characterized by a serene and exalted temperance, far removed from all extremes of penance or ascetic discipline, as from all forms of doctrinal dogmatism and intolerance.

And one cannot better estimate the truly Italian character of this form of Christianity than by comparing the character of Saint Francesco with that of Saint Domenico, Catherine of Siena, or Ignatius Loyola.

It is noteworthy that in these saints, who were purely Italian, mystical virtue and religious inspiration were always combined with remarkable power of action in social matters. For that reason they were able to work in accord with the Church, which was able and knew how to make use of their influence in moments of grave peril. The Roman pontificate by its wonderful faculty of adapting itself to the moral, social, artistic character of the Latin races, and more particularly the Italian people, was truly for long centuries an Italian institution. But those who to-day claim that among the peoples of mediæval Europe the Italians were those whom Christianity found, and left the most pagan of all, speak truly of the past, but at present and possibly in the future an international industrialism is preparing for a great modification of the historical heredity of the race. They are equally extreme in asserting that the papacy will always be a *dictator to the consciences,* as it certainly has been in the past; a necessity in governing a people in whom the religious sentiment was never associated with a deep knowledge and liberty of inspiration and of investigation which gives such a diversified character to the Christianity of the northern races. It is well to remember that the papacy, though it had in history a national and official character, and though the Italian people by a species of historical instinct, felt that the Latin, and national spirit and traditions were really represented, not by the Empire, but by the Church, and it was therefore by nature Guelph, and anti-imperial, that is anti-Germanic. The Church was and it is still universal as an institution, and hence the Central Roman authority always accepts suggestions and ideas from the extremest limits of international Catholicism. The residue of this national spirit in the papacy, the last manifestation of which was in 1848, perished in 1870 when the Catholic Church was separated from what Dante calls «soma i gravame.»

For this reason and under the new conditions she can no longer respond to the exigencies and requests of a people who have the deepest inner religion. I do not think it prudent to affirm, as others have done, that «nothing living or new, can ever again arise through the spontaneity of the popular faith,» or that the Catholic Church is absolutely incapable of reviving in itself the religious spirit. Indifference characterizes the *bourgeoisie* who are not the truly representative Italian masses, who may yet prepare some surprises and an unexpected outbreak of faith inspired by that need of religion that Mazzini, himself one of the most deeply religious spirits of our age, called «the universal breadth of humanity.» Should a man of the ideal greatness of a Francesco d'Assisi, or of a Savonarolo, rise up not in the name of a dogma, but in virtue of active love and social charity towards its fellow creatures and speak words of freedom, the Italian mind might yet follow new phases of Christian idealism and civil greatness which would be incompatible with modern liberty.

The Italian Catholic is not lacking in religious ideality and spiritual potentiality. It is good to recall the romantic and spiritual Catholicism of Manzoni, Pellico, Rosmini, if only to convince ourselves that the Italian genius and the Christian spirit may unite to form a kind of intellectual greatness, and that the Christian conscience—in its Catholic ideal—may well be compatible with a certain spiritual liberty. It is doubtless true that among the Italian Catholics the performance of external acts such as are required by the Church too often goes hand in hand with intellectual incredulity or indifference, and sometimes as in the case of the rough, illiterate peasants, especially in the south, also with crime. The type of *Ser Ciappelletto* is ever alive and real; and of this union of outward religious observance with immorality of life, the history of the Renaissance gives us enough examples without quoting others.

There is no doubt that the profound sentiment of individual responsibility and of sin presented to the conscience by continual introspection, makes it less possible for those nations who have embraced Protestantism to understand this compromise with immorality. But we must bear in mind that that very imaginative faculty that prevails in the Italian mind may aid in keeping alive the sentiment of the divine, and in discovering it in every natural object (you recall the Canticle of the Sun by Saint Francis); and that in a Catholic family of good life, the purity of religious and Christian sentiment is not inferior to that in a religious evangelical family, notwithstanding that the latter is provided with more religious instruction. If in one there is more spiritual life, in the other there is a sense of authority and of discipline, and coefficient of moral greatness. However, if one considers the present conflict between Church and State in France, that kind of «Serrata» to which the French clergy lend themselves in obedience to the command of Rome, it shows a noble example of discipline and solidarity.

A phenomenon worthy of attention and a possible index of an internal Catholic regeneration in Italy is the importance that the laity are gaining in the life of the Church, as was pointed out to Germany in a notable book by Professor Ehrard. The Catholic activity of the last few years is owing greatly to this fact, and even today, although disapproved by the Pope, the «Lega Democratica Nazionale» is declared pub-

licly to be independent of the Church party, and thus assumes liberty of action in its economic and social programme. The motive of all this certainly was not a religious one, but it doubtless will exercise a salutary reaction on the religious life. Thus the laity may be the means by which the Church may unite with modern culture. By its means the central authority of the Church may contribute indirectly to reawaken the religious sentiment in Italy, as she is still in principle, if not in fact, the greatest spiritual power in the world. And in this the personal character and initiative of the Pontiff play an important part. Now while Leo XIII. was a diplomatic Pope and a politician, Pius X. is an essentially religious Pope. His main object is to strengthen the internal discipline of the church, or *instaurare omnia in Christo,* as he expressed himself. Meanwhile the history of the Church teaches us that popes of that temperament make many difficulties for the Church, for they look neither to the right nor the left but follow out their own idea. Leo XIII., a more liberal and more subtle spirit, who understood how to unite the Church with the States of Europe by *lenti giri e con maestri passi,* to quote Ariosto, would probably have succeeded in avoiding the present conflict with France. But from the simple and direct mind an impulse may be communicated to the religious conscience of Italy.

The condemnation of democratic Christianity although perhaps dangerous to Catholic interests and to the social organization of the Italian Catholic party is induced by fear that the younger Italian Catholic element, in its social and political action may lose sight of the true religious scope of the Church.

We cannot eliminate religion from our life. And as the State cannot but acknowledge the great power of social and political action, it belongs to the Church to contribute to the renewal of spiritual vitality, instead of yielding to worldly and political aims as she formerly did. The Catholic Church could also purify and simplify the ritual, bringing the liturgy closer to the intelligence of the people by the use of the vulgar tongue, limiting and rendering more intelligent the worship of saints, elevating Church music (as the present Pope has done by restoring the Gregorian music), instructing the clergy in the culture of the arts, and in this way the clergy and then the people would restore to the sacred images the dignity of religious art, in the place of all the paltry and unattractive ornaments that now disfigure it. External nature may lend its aid to the religious sentiment in a people born to art and beauty; and the crosses raised on the summits of the Alps and Apennines may prove to be symbols of this regenerated religious spirit.

But above all things the popular reading of the Bible and instruction in the New Testament should be diffused in order to destroy that indifference which is the greatest enemy of religion in Italy; and the people should be made to feel that the mediation of the priest cannot suffice for the needs of the soul, even of a Catholic; and religious truth should be presented in a manner to display more vividly than is now done the incompatibility of immoral life with a Christian conscience, and the inefficacy of religious rites alone to reform a sinful life.

But it happens also that the Christian Church, and more particularly the Roman Catholic Church, recognizes two fundamental necessities of the modern spirit; one that regards the system of faith, and the other that refers more especially to the Church organization as a social institution, which alone can bring it in touch with the life and culture of our day. The doctrine of the immobility of dogma, not alone in substance, but also in formula, and still more the papal infallibility, preclude all possible doctrinal development in religion. Now religious knowledge, like every other form of knowledge, should be open and capable of perfection in interpreting doctrines of faith; and the same concept of revelation for whosoever looks upon history as a divine education of humanity does not exclude, but rather implies a gradual progress. Whatever lives must develop and perfect itself; immutability means death; and if the doctrinal system of the Church is a living organism it must also submit to the general law of evolution. And this is necessary for the social equilibrium. Religion is the custodian of tradition and is tenacious of what Schiller, in Wallenstein, calls «the eternal yesterday»; while science and history woo the future of humanity. But as both powers are necessary to the economy of life, so science on the one hand profits by the continuity of the work which unites the present and the future with the past. On the other hand religion must seek in the past the germ of the future, and the strength of regeneration.

The Church must also be convinced religious life should reflect in itself spiritual liberty, the essential form and conditions of modern social life in all its manifestations. If it be true that where the spirit is, there is liberty, it is none the less true that where liberty exists there lives also the spirit. The institutional and confessional character of religion is what chiefly repels modern thought. In Italian society in which the individual is no longer a member of an organization or institution, but acts freely with the consciousness of his rights, no religion is possible but one that is founded on intellectual liberty and individual initiative. The Socialists also recognize religion as a *privat Sache,* and that is certainly what it should be, a personal and intangible right. Again, if religion as a universal fact would have the value of a social function and for that reason be always represented by an institution, the secret of its strength and the pivot on which it must turn in the future must ever be liberty of individual conscience. It is only by reconciling the cure of souls and the inherent spiritual need of the Italian race, with the profound and necessary exactions of modern civilization, that the Roman Catholic Church can exercise a beneficial social power according to the forms permitted by civil liberty and by the progress of human culture.

Alessandro Chiappelli,
Professor of Philosophy, Royal University of Naples; Commendatore della Corona d'Italia; Author of «The Philosophy of Religion,» etc.

17. **Italy—Education.** In the movement of modern culture, Italy has for many centuries maintained characteristics peculiar to herself. She forecasts and prophesies, but her

work is restricted to the few and has not the power of assimilation to the masses; it is a nursery of budding genius, which brings forth few flowers, or fruit in its garden. It is in Italy that new thought expands; that the world of intellect is quickened. But this new thought which she has always produced she has never enjoyed. Humanism and the Renaissance began at a distance from Italy with the reformation of the practical energies of life; in Italy, literary culture, the Belles Lettres, were the possession of the few. The philosophic trend of thought introduced by the Renaissance put an end in Italy to mediæval mysticism, discovered new relations between nature and society, affirmed with Bruno the Infinity of Nature (*L'infinita natura*), and with Campanella *Il senso come sapere*. But elsewhere Spinoza, Schilling and Hegel explained the philosophy of immanence; and elsewhere Cartesio, Locke and Kant propounded the new theory of subjectivity. In Italy, Galileo introduced the new experimental philosophy; but it was elsewhere, with Bacon, that it became a system of logic and was generally diffused. It was in Italy, some years later, that Vico discovered many of the fundamental laws which govern society, but it was elsewhere that Vico's ideas were developed to their fullest extent. For many centuries the whole history of Italian culture is the history of initiative genius, but it is also the history of prodigious energies that were made of practical value elsewhere, and that exercised little or no influence in Italy.

What causes progress, what transforms and regenerates the education of a people comes from above, from its ideals; from its conscience, from its intellect and its culture; from the permeating of its social life and its activities with the modern ideas.

But all this could not come to pass in Italy. Here, even as regards education, we have ideas and movements for regeneration without the power to carry them out, and make them general. Italy, even in the educative field, heralded the better part of Humanism, through Vittorino da Feltre; but the scholasticism inaugurated by him was of little benefit to the majority, and, besides, it was narrowed and spoiled by the meaningless verbalism of the Jesuits and the other monastic orders.

With the improved political conditions in Italy in the 18th century, and the new aspirations in regard to civil life, the educative idea acquired gained bolder recognition among Italian men of letters and philosophers, particularly with Genovesi and Filangieri; just as the effect of the French Revolution was felt at a distance, there were also signs in Italy of some new idea.

As Italy now found herself face to face with new educational needs, it was necessary that she should have the Revolution of 1860, the true national re-birth.

The political revolution of 1860 required a great popular educational reform, in order to make the life of the new nation and the new State orderly, strong and secure. And such a reform was all the more urgently needed inasmuch as all knew that the revolution, which gave Italy its independence and made it a united kingdom, was the work of a cultured few; the effort and the aspiration of the best part of the *bourgeoisie*, who knew how to harmonize their ideas with those of the people.

The revolution of 1860 thus affected philosophic thought, the arts, literature; but it did not affect the conscience of the common people. Nevertheless, the revolution represented one of the greatest crises of history, inasmuch as it was to give new scope to the moral consciousness of Italy, and of the world, since it was not possible to overturn the papacy and reconstruct the nation as a unity without touching the deepest life of the Italian consciousness. There was, and is still going on, a moral conflict: the laic government, destined to develope on liberal lines still finds itself in Italy, in the midst of an ignorant and superstitious population. The formula of Cavour «A free Church in a free State,» requires the education of the people on lines of moral, civil and political liberty in order to have concrete value, or historical efficacy. There still exists, a political conflict in the mind of the nation. For while the new States called the people to public life, they had been for centuries degraded and neglected, and were unprepared by special education to value either civil or political liberty. And this is the true reason for the apathy, the conflicts, the confusion and the anomalies of modern Italian life; and this is the true cause of the lack of good administration in Italian parliamentary life. How is it possible that political convictions should be formed; that there should be an interest in public affairs; purity and integrity in the exercise of electoral privileges, in a country where education is lacking in regard to the institutions by which it is governed?

There is also a serious economic conflict in the life of the nation. Italy is fertile; she abounds in natural wealth, and has, moreover, an abundance of the best kind of wealth: soundness of moral fibre and genius. But this does not suffice. For it is not possible, amid the economic competition of the civilized world, that an uncultivated, uneducated people should produce as much as those nations that are cultured and educated; or that their products should bear comparison with those of their competitors.

We do not wish it to be understood that Italy of to-day has done nothing for the education of the masses. She has done something, but ought to do a great deal more. It is true that Italy had to face an enormous task, complex and arduous. She had to found the nation and reconstruct every part of her administration. She had to give an impulse to the puny economic life of the country. She had to supply all the urgent needs of defence. She had to modernize an entire people; to reorganize the culture of the higher and middle grade institutes, and with all this to reconstruct the scholastic and educational life of the masses, without any precedents in liberal thought, or educational institutions. Thus the task of the United Kingdom was more and more arduous, and necessarily so on account of the preponderance in every society of the material over the moral life; on account of the traditional custom that the ruling classes should first provide for their own welfare, instead of pro-

viding for the culture of the masses. For these and other reasons, the reform in the education of the masses could not be radical, complete, effective; and therefore it could not have the impetus, the coherence, that it has elsewhere.

But if Italy has not done all that she should do, the example of other nations who have already achieved will incite the nation to do better. But satisfactory progress is impossible unless the government take charge of the common school education, instead of leaving it to Communal and local authorities.

In the last statistics, out of every hundred recruits an average of forty were found to be illiterate. Nevertheless there is progress and even to-day there is a rich field of primary moral instruction in the various regions. In the social order the importance acquired by higher culture and common schools necessitates a better education of infants and younger children. The deep moral crises which perturb the conscience of the masses, make an early cultivation of the heart indispensable; and democratic life renders necessary the provision at an early age of an education of equality and of reciprocal respect. But these elementary institutions are not in proportion to the social needs.

And progress has also been made in the education of the people for professions. There is a form of professional instruction, which makes part of popular education, for without it popular culture would not be effective, such as the learned professions, the arts, or the trades necessary to all. Modern Italy in this respect, has a legacy of institutions. There are industrial schools, art and trade schools, schools of applied art for industry and industrial design, professional and commercial schools for women, schools for viticulture and enology, field courses in agriculture. But although there is progress even here, these schools are not adequate to the needs of the people. The alumni of these schools number only about 60,000.

When we think of the great popular educational revolution, which required the political revolution of 1860, we must acknowledge that what has already been done is insufficient for the needs of the masses. Italy as regards popular pedagogy is a nation *in fieri*; a nation without harmony and equilibrium between its political institutions, its obligations, and the education of the masses. The agitation by the best element in the kingdom, and by the democratic party in parliament, shows that the nation feels the need of a more intense and more comprehensive popular culture.

The progress of modern Italy in the so-called «middle schools» and in the universities, and in the higher colleges has been very marked. After the beneficient law of Gianturco in the normal schools, these seminaries of the nation have acquired a great importance, both on account of the culture which they impart, and also on account of the attention given to the preparation of future teachers. The lyceums and the technical institutes continue to improve their teaching force; the universities also grow from year to year in the number of students and improve in scholarship and science.

And here we must turn our attention to Pedagogics.

Italian thought, philosophical, sociological and pedagogical, in the second half of the 18th century, owing to the political effects of the Revolution, approximated more and more to the French thought. At the dawn of the century Realism (Sensismo) prevailed with Borelli, Soave, Gioia; and even our pedagogical learning under Cuoco, Delfico, Capecelatro, and others, felt the influence of French thought.

As the century advanced, new life came into the thought and a new turn was given to pedagogy, and, as in Germany, France and England, so in Italy we find pedagogics and philosophy allied.

It was Pasquale Galluppi who showed Europe that there existed in Italy a new movement in philosophic thought; but it was the Romagnosi, the Rosmini, and the Gioberti who made it evident to Italians through their researches in philosophy and pedagogy.

Romagnosi (1761-1835) represents the greatest and most extensive results in civic philosophy and civic education. In his work 'Dell' indole e dei fattori dell' Incivilimento,' he gives a sociologic significance to education, considering it as one of the prime factors of civilization.

Romagnosi founded his pedagogical doctrines on social psychology, and not on the individual psychology, and all the minute and subjected analyses of the philosophers of his day. According to Romagnosi the mind while yet in its individual formation passes through three distinct phases: that of *sensation*, of *imagination*, and of *reason*. Romagnosi saw all the importance of spontaneity in the scholar, but he also knew when the mind should be permitted to function unaided, and when it should be directed by human art. He desired that educational culture should unfold from the exterior domain of sensation to the inner man; he considered literary and scientific culture necessary in the scholastic field and thinks that the State should take care of the education of the people. Romagnosi wrote argumentative treatises on education, and was also interested in special pedagogic-scholastic questions. Cattanes followed in his footsteps, as did Ferrari, Giuseppe Sacchi, and the famous writers of Crepuscolo, who from 1849 to 1859 reconstructed the consciousness of Lombardy. Romagnosi represents the laic professor of the universities in the Italian cities in the first half of the 19th century.

Even Antonio Rosmini Serbati, 1797 to 1855, did not dissever philosophy from pedagogical thought, but his mind had other motives, other scopes, other directions. 'Il Nuovo saggio sull' origine delle idee' (1835) lays the foundation of his whole system of philosophy, a system which he developed more fuily in successive works, in which there are frequently considerations relating to education, or dissertations bearing directly on the subject. While Rosmini inculcated an idealistic philosophy, which should be modern, catholic, and patriotic, he represented the neo-guelphian idea.—the idea which was to reorganize Italy with the papacy. He left incompleted his work on higher pedagogy, 'Del principio supremo della Metodica.'

Rosmini had an interpreter of his ideas in pedagogics in Giambattista Antonio Rayneri.

The philosophy of Vincenzo Gioberti, 1801 to 1852, is this same idealistic philosophy—a catholic philosophy which seeks to regenerate catholicism. 'Il Primato morale e politico degli Italiani' (1843), and 'Il Gesuita Moderno' (1845), may be considered as veritable treatises on national pedagogy. But Gioberti in the course of politics and pedagogics, after the misfortunes of the war of 1848-49, reconstructed his politicai convictions and in 'Rinnovamento civile d'Italia' (1851) he prophesied a new Italy and the end of Guelphism. He had an interpreter of many of his doctrines pertaining to scholastics in Vito Fornari. Meanwhile, it is remarkable that Gioberti and Rosmini, two philosophers who wished to found a catholic philosophy, were both opposed and condemned by the Church. They both combated Pantheism and both were considered pantheistic by the Church. The Church condemned the patriotism of both. Among the great and liberal army of thinkers, of heroes, and of martyrs of *La Giovane Italia* Mazzini was a genius and a hero. He was not a philosopher in the sense of belonging to a school, or of being limited to a school of philosophy. He was the most exalted soul, mind and conscience, and most laborious patriot of Italy. Are not philosophy and pedagogy included in these words of his? «Without national education there exists morally no nation. The national conscience cannot be awakened except by its aid. Without national education, common to all citizens, the equality of civic duties, and rights is an empty formula. The consciousness of duties; the possibility of rights of citizenship are left to chance or to the arbitrary choice of whoever may select the educator.»

La Giovane Italia educated the nation more than all the treatises on pedagogy of the day; more than all the professors. It coöperated in Italy's political reorganization more than all the neo-guelphian initiatives.

Italy had, nevertheless, treatises on pedagogy in the years preceding the national reconstruction and these were written in order to hasten and prepare the way for this reconstruction.

Niccolo Tommaseo, a man of liberal, universal mind, in his work 'Dell' Educazione-osservazioni saggi pratici,' published for the first time in 1826, had a wide conception of pedagogy. Tommaseo saw in education the root of all good. He felt the importance of the new methods and of schools for the masses.

Among the treatises on General Pedagogy, we may consider the 'Pensieri sulla educazione,' by G. Capponi (1792-1875), published for the first time in 1845. In this treatise, small in bulk, but full of ideas, Capponi considered under a new aspect the pedagogical reform, initiated by Rousseau's 'Emile,' and determined what there was of truth and value in it. Capponi combated educational superficialism, and pointed out the multiplicity of causes that might make the work of education effective.

Raffaele Lambruschini had a veritable worship for education, which he, like Capponi and Tommaseo, combined with a great love for Italy. His work as a pedagogist and educator was important, not alone in Tuscany, but in other parts of Italy. His 'Trattato dell' educazione' was published in 1850, together with his complete works, subsequent to the reconstruction of Italy.

Other treatises on pedagogy were published by Vitale Rossi di Spello (1782-1851) in his 'Manuale di scuola preparatoria'; by Luigi Alessandro Parravicini (1800-1880) in his 'Manuale di pedagogia'; by Domenico Berti (1820-1897) in his book 'Del metodo applicato all' insegnamento elementare,' published in 1849. But the most systematic and best arranged work on pedagogy is that of Giambattista Antonio Rayneri, 'Primi principi di metodica,' published in 1850. Rayneri (1810-1867) was one of those who took the most prominent position in the diffusion of pedagogical culture among teachers, and it was not long before his books became almost a gospel for teachers.

Those who compared foreign treatises on pedagogy with our own found that our pedagogical culture was too local and not sufficiently universal; that Italy needed a psychological revival so as to be able to place the science of education on a broader foundation; that there was a predominance of theological-metaphysical ideas; that the lack of the spirit of political liberty restricted to a great extent the action of social ideas of any kind, and even of the pedagogical idea; that the lack of scholastic life made pedagogy almost entirely formalistic.

And in this first half of the 19th century, with its new pedagogical ideas, and its new scholastic movement, we must note the literary revival in the schools through the works of Giannetto; of Luigi Alessandro Parravicini; of the 'Letture per fanciulli' by Lambruschini; of the 'Letture graduate' by Thouar; and of the many books of Cesare Canú, by Antonio Fontana, and by Vincenzo Troya. In all these new books for school reading there breathed a popular spirit, and it made one feel the need of harmonizing the school with the actual life of the people, and of adapting the life and teaching of the school to the life and thought of the masses.

The Institutions of Ferrante Aporti (1792-1857) brought into brotherhood men of various beliefs, and were also patriotic institutions. If these institutions were not new they at least derived benefit from the new Italian sentiment; and the asylums were coöperative in the Nation's reconstruction, and made it evident to the masses that Italy would arise with new and higher ideals.

Pedagogical literature was also represented by women in Italy at this period by Caterina Franceschi Ferrucci (1803-1867), whose chief work was entitled 'L'educazione morale della donna italiana.' Her work was highly praised, as it deserved to be. Giulia Molino-Colombini (1812-1879) also wrote on pedagogy, and her work is entitled, 'Sulla educazione della donna.'

But after 1860, when the greater part of Italy became unified, there arose a new life, the life of the nation; and with the new life of the nation, a new philosophy, a new pedagogy.

The philosophy which before the revolution had been mainly neo-guelphian, now became wider in its scope, more Hegelian through the

work of Ansonio Franchi Giuseppi; more positive in the writings of Andrea Angivari. The older schools continued, it is true, on the same lines, but the new life in the thought of the day made itself felt even here. The need of forsaking old traditions and placing the higher Italian intelligence on a par with the rest of the world; the need of making philosophy a free interpretation of the mind; the need of making the reconstruction of Italian speculative thought correspond to the reconstruction of the whole Italian life. Whilst before the revolution philosophy and pedagogy were strongly tinctured with Church doctrines, though perhaps ignorantly, there now arose a philosophy independent of all religious beliefs, a philosophy which sought nothing but the truth, and the interests of humanity.

But even after the revolution pedagogical teaching allied itself closely to philosophical doctrines. Fusco, Siciliani, Angiulli, Latino, Gabelli and Veniali were very prominent in the pedagogy of the day. Eduardo Fusco (1824-1872), professor of Anthropology and Pedagogy in the University of Naples, in his lectures, edited by his wife after his death, gives evidence of a high and varied degree of culture, and profoundly liberal sentiments He had a profound belief in education for refashioning Italian life and consciousness. Pietro Siciliani (1835-1885) combined more broadly than Fusco philosophic speculation with pedagogics. He sought in philosophy a certain *middle way*, which should merge into an eclecticism influenced by the positivist traditions of Galileo and Vico. He became, in fact, after his manner a solitary positivist. He wrote a great many works on philosophy. His pedagogical works were the 'Storia critica delle teoria pedagogiche in relazione colle scienze sociali'; 'La Scienza nell' educazione secondo i principi della sociologia moderna.' His writings on pedagogy had a great influence on teachers.

Andrea Angiulla (1837-1890) was constantly occupied with the thought of a regeneration of philosophy and pedagogy. Three of his works are 'La filosofia alla ricerca positiva'; 'La pedagogia, lo Stato e la famiglia'; 'La filosofia e la scuola.' These works are an honor to Italy. In no country has there been a higher conception of pedagogy than that of Angiulli. He was a great student of scientific philosophy and maintained his independence of thought in opposition to the greatest thinkers of the age. To all that he wrote, Angiulli gave the imprint of his personality, and even the things said by others acquired a new value when spoken by him.

Emanuele Latino (1845-1890) wrote 'Dell' educazione letter-aria'; 'Il lavoro manuale e il problema educativo'; 'Della pedagogia nelle sue armonie ed antinomie'; 'L'ultima mostra universale e i nuovi bisogni della vita scolastica (Le Malattie della scuola e la riforma igienica net rispetto igienico, pedagogico e sociale'; degli arredi scolastici'; 'Frammenti pedagogici.' Latino had not the philosophic and universal mind of Siciliani and Angiulli. He dealt with the most prominent questions of pedagogy, but he treated them from a critical scientific standpoint.

Aristida Gabelli (1830-1891) was the author of 'L'nono e le scienze morali'; 'Il metodo di insegnamento'; 'L'Istruzione della donna in Italia' 'Pensieri'; 'L'Istruzione in Italia'; 'Il mio e il tuo'; 'La nuova scuola di diritto penale in Italia'; 'Gli scettici.' Gabelli had a great insight in regard to schools, and promoted the regeneration of their methods. His works, 'Il metodo di insegnamento,' had a great share in the regeneration of the Italian schools. Whilst among the teachers of the period preceding 1860 the Pestalozzian reform reached in through the interpretation of Girard, with Gabelli the system of Pestalozzi entered the schools stripped of all unimportant elements, and in its living and vigorous substance.

The teachers of this system, the schools and the scope of pedagogics were very effectively influenced by Francesco Veniali. The questions in regard to the importance of the common school, and the social standing of the teachers in new Italy was considered by him. By him, also, the new didactic method was discussed in a practical manner; and he was the first to lay bare the defects in the existing school administration, which left the common schools to the commune, upholding, according to Italian tradition, the direct action of the government. Francesco Veniali had the affection and esteem of all the educators of his day. It was he who placed the various systems on a practical basis; it was he who promoted the improvement in normal schools, and who contributed very largely to the higher culture of teachers.

Adolph Pick established in Italy the Froebel Kindergartens, which met with favor. Thus we find the Asylums of Aporti and the Kindergartens which Giuseppe Sacchi established and sought to improve.

Italy boasts to-day living pedagogists of great ability who honor her. We may cite Allievo, Cololla, Credaro, Fornelli, and Sergi.

Saverio De Dominicis,
Professor of Pedagogy, Royal University of Pavia; Author of Works on Teaching, Schools and Universities.

18. Italy—Schools and Universities. Public instruction in the kingdom of Italy is essentially of three grades: (1) Primary and popular; (2) intermediate and secondary; (3) high school grade. The fundamental laws which govern it are in force to-day, in spite of the modifications that have been brought to bear through later laws and regulations, and the observance of special local laws, such as the Sardinian law of 13 Nov. 1859, No. 3725, commonly called the Casati Law, from the name of the Minister of Instruction under whom it was passed.

1. Primary and Popular Instruction.—Primary instruction is given, in general, in the elementary schools, and the course, under the care of men and women teachers under the direct superintendence of school inspectors and directors of instruction, lasts five, or even six years, under government control which determines the syllabus, the examinations and every other *modus operandi*. The elementary schools are supported by the communes.

Compulsory elementary instruction, prescribed by the law of 15 July 1877, No. 3961,

for all those who were not under private instruction, was through a later law of 8 July 1904, No. 407, extended to the 12th year of age; this is restricted to the primary elementary course (the first three years) in those communes where the compulsory higher elementary course is lacking, and in other communes is extended to all the compulsory classes of the high schools that may exist there. The same law of 8 July 1904, ordained, besides, that illiterate youths under military levy, of the third category, whether fit or unfit for service, should attend the night, or vacation schools (reading, writing, arithmetic, and the elements of the metric system); of which, of course, all other illiterate adults could also take advantage.

The subsidiary branches of the elementary schools are: the *Patronali;* the *Educatori* and the *Recreatori,* the kindergartens, and the professional schools, all of which are very little under legislative control or regulation. The government, for the most part, does little but exercise the right of instruction and supervision of institutions founded by local enterprise, or by the bequests of private citizens. The kindergartens, for instance, have for the most part been established by public or private beneficence; hence, as works of charity they are dependent, to a certain extent, on the Ministry of the Interior. These kindergartens number more than 2,000 public institutions, with 140,000 boys and 132,000 girls; and more than 1,300 private institutions with 42,000 boys and 43,000 girls.

A new institution of a free popular school lately established in Italy through private initiative is the People's University, the scope of which is to diffuse scientific, literary and artistic culture among the people. The new people's universities date from 1900. That of Turin, which may be called the original one, gave the key-note to what was to be the Italian type of the institution, having as its scope: (1) To popularize the most reliable conclusions of science, making them accessible to those who had not received a special scholastic training; (2) to impart in a simple and lucid manner instruction in the literature and history of the arts, with a view of accustoming the students to the conception of the noblest ideals of life. Rome and Bologna took up this movement almost contemporaneously. At present the institution is more or less general throughout the kingdom. There are in upper Italy about four universities in Piedmont and Liguria, seven in Lombardy, five in Venetia, eight in Emilia, one in Rome, one in Naples, three in the rest of southern Italy, three in Sicily; and many others are being established in various parts of Italy. They are also to be found beyond its confines. Italian people's universities have been founded in Innspruck, at Trieste, Trent and Zurich.

2. *Intermediate or Second-grade Instruction.*—Intermediate or second-grade instruction is of three kinds: (1) classical; (2) technical; (3) normal, or pedagogical.

1. Classical instruction is carried on for five years in the gymnasium, and for three years in the lyceum, and comprises the following subjects. In the gymnasium: Italian, Latin, Greek, French, history and geography, descriptive geography, mathematics, natural history, gymnastics. In the lyceum: Italian, Latin, Greek, history and historical geography, philosophy, mathematics, natural history, physics and chemistry, gymnastics. According to the data furnished by the «Annuario del Ministero della pubblica istruzione,» there were altogether in Italy in March 1906, 215 royal, or government institutions of this order, of which 117 were lyceum-gymnasiums, 7 lyceums and 91 gymnasiums; and 86 pareggiati, *i. e.* institutions maintained at the expense of local communities, but of the same grade as the government schools as regards the course of study, 26 of which are lyceum-gymnasiums, 9 lyceums, and 51 gymnasiums.

2. Technical instruction is imparted: (a) In the technical schools; (b) In the technical institutes; (c) In the nautical institutes.

(a) The technical schools aim to give technical instruction of the highest grade; that is, to complete and extend the knowledge acquired in the elementary schools in such a manner that the students may succeed in conducting a business, and in minor administrative offices, and may be enabled to pass the examination for admission to the first class of the Technical Institute. The years of study are three, and cover 10 branches of study: Italian language, French language, Italian history, geography, instruction on the duties and rights of citizens, elementary mathematics, instruction in the natural sciences, accounting, designing, caligraphy, besides gymnastics.

(b) The technical institutes have as their scope to impart technical instruction of the second grade, that is, to furnish the instruction necessary to prepare the student for higher studies, to qualify him for certain professions and for positions in the government, in industry, commerce and agriculture. The course of study is, therefore, divided into several sections: a physico-mathematical course; surveying; a commercial and bookkeeping course; a course in agriculture; an industrial course. Each of these is adapted to some special end, and for that reason differs from the rest in the character of the instructions imparted. The course of study in each branch lasts four years.

(c) The nautical institutes have as their object to give intermediate technical instruction to those who intend to dedicate their lives to navigation, and maritime arts and industry. The nautical institutes include three branches: one for captains; another, machinists; and another, for shipbuilding. Each branch comprises two courses; one of two years for sea-captains on larger coasting vessels; one for machinists, and for naval instruction of the second grade; another of three years for deep-sea captains, for high grade machinists, and for naval construction of the highest grade. A preparatory course of two years, to which the elementary school certificate gives admission, precedes each of these courses.

There are in operation in the current school year 192 technical government, and 105 technical pareggiati schools; 18 nautical government schools, and one nautical pareggiati school.

3. Normal, or pedagogic instruction, is imparted in the normal boys' schools, and in the normal and complementary girls' schools. Of the former, 29 are under government control and three are pareggiati; of the latter, 78 are

government schools, and 22 normal and six complementary pareggiati. There are besides three Regie Scuole normali di ginnastica in Rome (boys), at Turin and Naples (girls). The normal boys' and girls' schools are of two grades, elementary and high school. In the lower grade the studies are with a view to obtaining the certificate of teacher of the first three elementary classes; in the higher grade the studies are carried on with a view to obtaining a certificate as teacher of all of the five or six classes, and in the female department also a certificate as teacher or directoress of a kindergarten. The course lasts three years for each grade. The complementary school course is also three years for each grade.

Other institutions of minor importance under government control are: (a) The Convitti Nazionali, the aim of which is to give to young boys a moral, intellectual and physical education to make them worthy citizens. There are 43 such schools for boys, with over 4,000 boarders.

(b) Female institutes or female asylums. These may be divided into three categories: (1) Shelters to provide temporary assistance for poor children, orphans, deserted children, etc.; (2) Educandati, for children (girls) of refined and wealthy families; (3) Misti (mixed schools) which partake to a certain extent of the nature of both.

Special institutions of the second class dependent on the Ministry of Agriculture, Industry and Commerce are: 34 schools of practical agriculture (especially for viticulture and enology); about 260 industrial and commercial schools; two schools of mines (at Iglesias and Caltanissetta); three intermediate schools (at Bologna, Genoa, and Rome).

3. *Higher Instruction.—Universities.* Higher instruction is imparted in the universities properly so-called, and in other special institutes equipped similarly to the universities in the character of their instruction. The Italian university consists fundamentally of the Faculty. The Faculty comprises four chairs: (J) Jurisprudence; (M) Medicine and Surgery; (S) Science—Physics, Mathematics and Natural Sciences; (L) Literature and Philosophy.

Certain schools may form an integral part of the university, or be annexed to it, as the following: (E) Applied Engineering; (A) Agriculture; (P) Pharmacy; (V) Veterinary Medicine; (O) Obstetrics.

There are, properly speaking, 21 universities, of which 17 are royal or governmental, and four free universities, numbering in all an attendance of 24,038 students in the scholastic year 1905-1906. These are enumerated in alphabetical order, according to the name of the city in which they are situated. There are given also, according to epochs, the faculty and the schools that belong to each respectively, and the number of students enrolled in each university (in the given school year).

Royal Universities.—(1) Bologna.—J. M. S. L.; E. A. P. V. O.* Students enrolled, 1,616; not including E., 113. (2) Cagliari.—J. M. S. P. O.; enrollment, 243. (3) Catania.—J. M. S. L.; P. O.; enrollment, 832. (4) Genoa.—J. M. S. L.; E. (1st year) P. O.; enrollment, 1,193. (5) Macerata—J.; enrollment, 357. (6) Messina—J. M. S. L.—P. O.; enrollment, 570. (7) Modena—J. M. S.—P. V. O.; enrollment, 474. (8) Naples—J. M. S. L.—P. O.; enrollment, 5,740. (9) Padua—J. M. S. L.—E. P. O.; enrollment, 1,385. (10) Palermo—J. M. S. L.—E. P. O.; enrollment, 1,094. (11) Parma—J. M. S.—P. V. O.; enrollment, 695. (12) Pavia—J. M. S. L.— E. (1st year) P. O.; enrollment, 1,514. (13) Pisa—J. M. S. L.—E. (1st year A. P. V. O.; enrollment, 1,083. (14) Rome—J. M. S. L.; P. O.; enrollment, 2,660. (15) Sassari—J. M.; P. O.; enrollment, 199. (16) Siena—J. M.; P. O.; enrollment, 225. (17) Turin—J. M. S. L.; P. O.; enrollment, 2,892.

Free Universities.—(1) Camerino—J. M. (1st four years); P. O.; enrollment, 355. (2) Ferrara—J. M. (1st four years); S. (Mathematics alone) P. O.; enrollment, 226. (3) Perugia—J. M. (1st four years); P. O. V.; enrollment, 305. (4) Urbino—J.; P. O.; enrollment, 267.

The scholastic year begins in the universities on 16 October and ends on 31 July. Each university publishes an 'Annual,' in which, in addition to the list of names of professors and students, the statistics, calendar and hours of study, are inscribed the inaugural discourse of the academic year, and a catalogue of the works published during the year by the professors and assistant professors.

The government of the university with its varying duties, and always under the supervision of the Minister of the Interior, is in the hands of the following authorities: (1) The Rector; (2) The Academic Council; (3) The Presidents of Faculties and Directors of Schools; (4) The Council of the Faculty; (5) The General Assembly of the Professors.

There are three distinct classes of instructors: (1) Official instructors (in ordinary and extraordinary); (2) Teachers in charge; (3) Unattached, or private teachers.

In conformity with the law of 12 June 1904, No. 253, the nomination of professors in ordinary and extraordinary is, with two unimportant exceptions, by competitive examination.

The appointment of those professors who give instruction in certain higher branches is only for one scholastic year, but the appointment may be renewed.

The official teachers (in ordinary or extraordinary) may hold private or outside classes; also the associate doctors and those who have qualified as unattached teachers. The courses in private instruction may be : (1) Pareggiati, and for the students have the same value according to law, both in the number of hours of study and the course of study pursued as the corresponding government or official courses; (2) Incomplete courses of study and not pareggiati correspond to a portion of the official course; (3) Supplementary courses of study which serve as subsidiary or as the complement of obligatory studies.

The official courses in instruction are public, except the practical exercises and the experimental demonstrations which the teachers

*Note: For explanation of letters see above, e. g. "J" stands for chair of jurisprudence; "M" for medicine, etc.

may limit to those alone who are enrolled in their courses.

A distinction is made between students and those who attend the lectures (*uditori*). The students, at the close of their studies, have the privilege of obtaining the academic degrees, conferred by the faculty or school to which they belong; the studies pursued by the *uditori*, on the other hand, are of no value in obtaining an academic degree. In order to matriculate, students must have obtained the diploma of graduation granted by a lyceum, or some other equally valuable certificate according to the general regulations, or the special regulations of the faculty or school, concerning admission to the various courses of study. Under specific conditions laid down by Art. 12 of the General Regulations (relating to the disposition of Art. 140 of the Casati law) both foreigners and Italians may matriculate, or continue their studies in the Italian universities, even though not natives or sons of Italian citizens, having or having had their usual domicile in foreign countries.

In the various faculties, or schools, there are held special examinations and examinations for certificates, for bachelor's degrees, and for diplomas according to the special regulations. The special examinations and the examinations for certificates are held in two sessions; the first, begins on 16 June; the second, on 16 October. The examinations for the degree of Bachelor and for diplomas are held during the scholastic year at certain times appointed by the Council of the Faculty. All the examinations are public.

Every scholastic year a competition is opened between the young Bachelors of the various universities and the institutes for higher instruction dependent on the Ministry of Public Instruction for a sum of money (scholarship) intended to place them in a position to perfect themselves in their studies at a national or foreign university, or to undertake a course of travel for the sake of study.

The following rules must be observed in the various Faculties:

Faculty of Jurisprudence.—The complete course of study lasts four years: a lyceum certificate is necessary before enrollment. The obligatory studies in each of which it is necessary to pass special examination in order to gain entrance to the examination for the degree of Bachelor, are 18.

At the suggestion of the Council of the Faculty, there may be in addition to these established courses—other courses. The course for aspirants for the diploma of notary lasts two years, with examinations in seven subjects. The course for aspirants for the diploma of procurator (attorney or solicitor) lasts about two years, with special examination in five studies.

Faculty of Medicine and Surgery.—The entire course is completed in six years. A lyceum certificate is necessary for enrollment. The essential studies which are obligatory before entering for examination for a Bachelor's degree are 20 in number. At the suggestion of the Council of the Faculty, acted on by the Superior Council of P. I., other complementary studies may be added. All the instruction is accompanied by demonstration and practical examples. «Institutes» or «Schools for Proficiency» may be established where various studies may be grouped together, according to their affinity, and even instruction in other branches may be associated with them.

Faculty of Physical Sciences, Mathematical and Natural.—The complete course of study (for every Bachelor degree in the Faculty) lasts four years. All those may be enrolled who have the lyceum certificate, as well as those who have a certificate of the physico-mathematical course from the technical institutes, and others who fulfil certain specified conditions established by Art. 9-11 of the General Regulations. The studies that constitute this course are 20 in number. Two degrees are conferred in this Faculty; that of Licentiate (Graduate), and that of Bachelor. Two years of study are required for the degree of Licentiate, and two years in addition for the degree of Bachelor after obtaining the degree of Licentiate. There are four certificates: two for physico-mathematical sciences, and one for natural sciences, and one for chemistry. Of the two certificates for physico-mathematical science, one leads to the degree of Bachelor in the university; the other to the school of applied engineering. The Bachelor's degrees are four in number: (a) In mathematics; (b) In physics; (c) In chemistry; (d) In natural science. The special rules of the Faculty determine the examination, and the Council of the Faculty indicate the studies that are required for the attainment of each degree.

Faculty of Philosophy and Literature (Belles Lettres).—The complete course of study covers four years. A lyceum certificate is required before enrollment. The course of instruction comprises 14 branches. At the suggestion of the Council of the Faculty, acted on by the Superior Council of P. I., complementary studies may be introduced. In this Faculty two degrees are also conferred, the degree of Graduate and that of Bachelor. For the former two years of study are requisite, and for the latter two additional years after obtaining the first degree. There are two Bachelor's degrees, one for philosophy, and the other for belles lettres. The students must have passed 15 special examinations, 10 of which are in fundamental studies indicated by the Faculty, and five in allied and complementary studies selected from the course, or from allied or complementary studies in the course of philosophy and belles lettres, and from other university courses. To gain admission to the examination for Licentiate (Graduate), the students must have passed at least seven of the 15 examinations obligatory for the degree of Bachelor of letters or for that of philosophy. The study of allied branches may be ordained in institutes, schools and seminaries of philosophy, pedagogics, history, philology, archæology, and art; and it may be made an integral part of the instruction with other branches, according to the special programme approved by the Ministry, and acted on by the Superior Council of P. S.

Schools of Teachers.—To the faculty of philosophy and belles lettres, physical science, and of mathematical and natural science are

annexed schools of teachers, whose object is to perfect the alumni in the art of teaching philosophic, literary and scientific discipline in the lyceums, in the gymnasiums, in the technical and normal schools and in the technical institutes. These are presided over by a director nominated by the Ministry for three years. The lectures they hold are private. The school of teachers annexed to the faculty of philosophy and belles lettres includes four departments, and requires a two year attendance of each student who is enrolled in it.

Royal Normal High School of Pisa.—The Royal High School of Pisa deserves particular mention whether on account of its special discipline, or on account of its importance. «Its object is to prepare and equip for the position of professor or teacher of Intermediate Schools.» It was established in Pisa motu proprio, by the Grand Duke, 28 Nov. 1846; or, to speak more correctly, re-established. For already at the end of 1813, by a Napoleonic decree (29 January) there was established in this city an ancillary of that Normal School of Paris which was rebuilt by the same Napoleonic government in 1808 on the site of the ancient French Normal School, founded in 1795 under the supervision of the Convention. The government of the school is entrusted to a council of managers presided over by the rector of the University of Pisa. The director of the school is chosen by the Minister of Instruction from among the professors in ordinary of the faculty of philosophy and belles lettres and from that of mathematics, physics and natural science of the same university. The school consists of two departments.

Schools of Pedagogics.—By a royal decree of 1 Feb. 1906, No. 30 (intended to correct and modify the Royal Decree of 19 Jan. 1905, No. 9) there was established near the Royal University of the Kingdom (in the faculty of belles lettres and philosophy) a course of higher studies (in proficiency) (*perfezionamento*) for the licentiates (graduates) of the government, or pareggiate, normal schools, with the view of preparing them for the position of school inspector, and school principal. The course covers two years, but may be completed in one year by anyone who, in addition to the requirements of the enrollment, has also obtained a Bachelor's degree or a diploma in Italian literature, history, pedagogics, conferred by the Royal Higher Female Institutes in Rome and Florence.

University Institutes.—There may be named in this category: (a) The Royal Institute in Florence for higher practical study and proficiency. This comprises three departments:—(1) Philosophy and Philology; (2) Medicine and Surgery; (3) Physical and Natural Science, and two schools, a school of pharmacy and a school of obstetrics. The administrative government of the Institute is entrusted to a council of managers consisting of five members, two of whom represent the municipality of Florence, and three the Royal Government; and the department of instruction to an academic council composed of five members—the president of the council of managers, the presidents of the three departments, and the director of the school of pharmacy.

(b) The Royal Scientific-Literary Academy of Milan. This has a University Faculty of Philosophy and Literature. By a Royal Decree of 18 Aug. 1880, there was added to the school of teachers annexed to this academy a department for qualifying students to teach modern languages and literature in the intermediate schools of the kingdom, to which are also admitted students who are not enrolled in the branches of philosophy and literature.

(c) The Royal Higher Institute of Technology of Milan. The obligations and government of this Institute, maintained by the State with the aid of the province and commune of Milan, are determined by the Royal Decrees of 13 Nov. 1862, 5 March 1863, 3 Sept. 1865, 5 Nov. 1875, 24 Jan. 1897. The institute comprises eight departments. The course in the preparatory school covers two years; that in the special schools, three years, and that in the Normal department, four years.

(d) The Royal Polytechnic High School of Naples. This school was established by Royal Decree of 30 July 1863, which at the same time abolished the pre-existing school of hydraulic and field engineering. It comprises courses in civil engineering, mechanical engineering, and architecture; and in addition a special course in electro-technics, and a course in hygiene as applied to engineering. Each course covers three years.

(e) The Royal Schools of Applied Engineering (not dependent on their respective universities) of Bologna, Rome and Turin.

(f) The Royal Naval High School of Genoa (hitherto dependent on the Ministry of Marine).

(g) The Royal Schools of Veterinary Medicine of Milan; of Naples and of Turin.

Institutes and Special Schools.—(a) The Royal Higher Institutes for Female Instructors in Florence and Rome. These were founded by the law of 25 June 1882, and their object is to provide for and to augment the literary and scientific culture of women, on the one hand, and on the other, to qualify them for teachers and instructors of special branches in the female normal schools, in schools of the highest grade, and in all the other intermediate girls' schools throughout the kingdom. The course covers four years.

(b) The University Schools annexed to the Lyceum Gymnasiums of Acquila, Bari, and Catanzaro.

(c) The Royal Institute of Social Science «Cesare Alfieri» in Florence with the annexed provincial School for Notaries. The course covers three years.

(d) The Royal Schools of Theoretical and Practical Obstetrics of Milan, Novara, Venice and Vercelli.

(e) The R. Oriental Institute of Naples. Here they have courses in Hindoostani, Arabic, Amaric, Turkish, Modern Greek, Albanian, Chinese, Japanese; in the Geography, Religion, Legislation of Oriental nations, and their commercial relations with Italy; and complementary instruction in English and Russian.

(f) The Business University, Luigi Bocconi of Milan. This was founded at the pious suggestion of the Milanese merchant, Ferdinand Bocconi, the elder, in honor of the memory of his son, Luigi, who lost his life in the

disastrous battle of Adua,—an Institution that should take its name from him and should be an ornament as well as a work of utility to the city and country at large. It was built as a public institution by Royal Decree of 29 Sept. 1902, and inaugurated on 10 Nov. of the same year. A regulation approved by ministerial decree 21 March 1905, made provision for the management of the institute.

(g) The Institutes (or Schools) of Fine Arts, maintained by the government, of Bologna, Carrara, Florence, Lucca, Massa, Milan, Modena, Naples, Palermo, Parma, Rome, Turin and Venice; and those not supported by the government, of Bergamo, Ferrara, Genoa, Novara, Pavia, Perugia, Piacenza, Pietrosanta, Ravenna, Tiena, Urbino, Vercelli and Verona.

(h) The Musical Institutes and Conservatories, under government control, of Florence, Milan, Naples, Palermo and Parma; and those not supported by the government of Bologna, Pesaro, Rome, Turin and Venice.

(i) There are some higher institutes dependent on the Ministry of Agriculture, Industry and Commerce, such as: (1) the three commercial high schools of Bari, Genoa, and Venice; (2) the two high schools of agriculture of Milan and Portici; (3) the higher Agrarian experimental institute of Perugia; (4) the institute of forestry of Vallombrosa.

Military Institutes.—Those dependent on the Ministry of War are: (1) The War School of Turin; (2) The Military Academy of Turin; (3) The School of Artillery and Applied Engineering, of Turin; (4) The Military School of Modena; (5) The School of Applied Military Hygiene, of Florence; (6) The Military Colleges of Naples and Rome; (7) The Central School of Infantry in Parma; (8) The Cavalry School of Pinerole; (9) The Central School of Artillery on the Poligono del Nettuno near Rome; (10) The Military School of Instruction in the Use of Arms, in Rome. Those dependent on the Ministry of Marine are (1) The Naval Academy of Leghorn; (2) The School for Apprentice-machinists in Venice.

VITTORIO PUNTONI,
Rector of the Royal University of Bologna.

19. Italy—The Education and Social Status of Women. One of the most remarkable features of progress in Italy is the advance made in the education of women. Formerly there were a few highly cultivated women, some even distinguished as writers or artists, especially as musicians and actresses, but until 1860 the great majority of Italian women were purposely condemned to ignorance, especially in the southern provinces. Women were not even taught to read and write; married or single, they were expected to take a subordinate position in their own families and in society. The ancient Roman law was still observed, which made the man the absolute master of the household, the *pater-familias*, whom even adult children obeyed as their supreme head. To-day education is compulsory and elementary education is given free to all children of all classes and of both sexes; the expenses are borne by the local authorities, assisted by the national Government, which exercises a general supervision over elementary culture. A movement is at present in progress for the entrusting of elementary education entirely to the State, and to secularize all schools for the lower classes. Elementary education is also imparted in private schools, authorized by the Government, and these are under the direction of lay or clerical teachers, duly qualified.

Educational institutions for women are divided into colleges and day schools; some of these are supported by the communes, some by the Government. Girls can pass from elementary to normal schools, these being usually the highest grade passed by women. This enables them, like men, to obtain positions of teachers in elementary schools. Women, however, have an advantage over men, as after their Normal degree, they may enter for four years' higher training in the Institutes of Superior Studies, where in addition to advanced literature, they are trained in several branches of science and in foreign languages, French being compulsory and a part of the programme, and either German or English, according to choice. The degree taken in these Superior Institutes enables the young women to teach in the Normal and Technical Schools. Education may be either technical and commercial, or classical. Women are admitted to all educational Institutes and can follow the same courses of study as men; they may take a University degree, and may profess and practice medicine, chemistry, arts, and philosophy, but a legal career is not open to women, even when duly qualified. About 25 years ago, the first student in law, Lydia Poet, obtained her degree, but was forbidden to make use of it. The Tribunals, which are a part of the Government Department of Justice, object to women-pleaders; hence legal training is of use only in a lawyer's office, not in Courts of Justice. Recently a woman-lawyer, Teresa Labriola, obtained permission to lecture in the University of Rome, where another very learned and brilliant young woman, Maria Montessori, M. D., has a chair of anthropology. In the University of Naples, Professor Ogliarolo is helped in his work and teaching of chemistry by his wife.

Technical, commercial, and professional schools prepare girls either for teaching in such departments or for becoming bookkeepers, cashiers, dressmakers, lace-workers, etc. It has at last been recognized that woman should undertake her share of work and contribute to the support of herself and her family. In Italy the woman question is much nearer solution on the economic than on the moral side; it is not usual to prepare for a profession a girl who has or will have private means sufficient to relieve her from the necessity for work; hence woman's education is not the same for all classes of society. Young girls of aristocracy of birth or wealth leave the convents or colleges where they have been educated with a fair equipment of general information: many of them acquire an equivalent education at home by private tuition; but such an education being uncontrolled by any sort of examination, and conferring no degree, does not enable its recipients to follow any career, should she some day need to work.

The Institutes of Fine Arts have also been

thrown open to women during the last 16 years, and many girls take their degree as teachers of drawing; some, very few, become painters or sculptors; many more work in the field of decorative art. The industrial arts have made much progress of late in Italy; there are three excellent Industrial Museums, the one in Naples being renowned for its important production of delft-ware. But where women excel to-day in such industries is lacework. It is scarcely 20 years ago that a Venetian Countess, Adriana Zon Marcello, a Lady of Honor to Queen Margherita, conceived the idea of reviving the lost art of lacemaking, for which Italy had once been so famous. Encouraged by the Queen, the work was revived, at first, in Venice, and has since so much interested the Italian ladies of the upper classes that the production of all kinds of hand-made laces and embroideries has been established in different provinces, reviving in each the special characteristic designs. A few years since the ladies conducting the work established an incorporated Association of Italian Feminine Industries, having its headquarters in Rome. The work exhibited is of exquisite character. Literature and journalism offer a large field of labor to women, but these professions are in Italy scantily remunerated.

No one who has not lived in Italy during the last 20 years can realize the wonderful advance made in every department of woman's life. Women's associations have been started, women's papers circulate, women work in new fields of labor, and they are fully recognized as able to take care of themselves. Such a remarkable advance surprises one most of all in Rome where it seemed well-nigh impossible that modern ideas could ever take root.

Twenty years ago Countess Salozai started in Rome the first review in Italy devoted to woman's interests. Though encouraged and supported by the Queen and by members of the highest circles of society, the time was not yet ripe; Italian women generally took little interest in the undertaking, which was finally renounced.

When Lady Aberdeen was president of the International Council of Women in 1898, she asked Mrs. Sanford, who was then coming from Canada to Italy, to invite Italian women to the great International Congress which was to be held in London in 1899. Mrs. Julia Ward Howe, who was then in Rome, greatly helped Mrs. Sanford in her mission. A meeting was held in Rome in 1898 and the Italian ladies present were deeply touched by the interest in Italy evinced by American women. They promised to draw up a programme that (adapted to the circumstances, habits and needs of their country) should make it possible to do something practical towards starting a National Council of Women in Italy. It was decided to federate in one large association the principal co-operative societies of woman's activity; and the aims of the General Federation of Woman's Work were defined as follows: To create a current of mutual understanding and kind feeling amongst women interested in this or other good works; to make widely known to the various existing enterprises of women; to bring about, by the force and influence of the union of Women's associations, the most desirable reforms.

Since the Congress in London, the first programme has been greatly enlarged, but it contained the central idea, around which the delegates of different associations grouped themselves. Countess Lavinia Taverna, a Lady of Honor of H. M. Queen Margherita, was unanimously named president and received the valuable help of Miss Dora Melegari, who was the first General Secretary of the Federation; she is one of the strongest of modern writers and a woman of very superior character.

When 60 different organizations, created and supported by women, had joined the Roman Federation, it was decided to begin with them a National Council of Women. Three years after the first Federation of Woman's Work was organized there were 60 different institutions, whilst in the same number of years American women organized only 11.

Italian women carry their aspirations further than philanthropic schemes; they aim at a social activity in the fullest meaning of the word, but avoid every sort of political action. They study the condition of woman, comparing it with her condition in other countries, taking into account the rare virtues of Italian woman, virtues that often, by the force of circumstances, reveal themselves in silent self-sacrifice more than in positive and efficient action. They acknowledge that woman in Italy has in all social spheres much to learn economically, morally, intellectually. The Italian woman is only now beginning to recognize and develop her moral sense and her social personality; and every effort is made to further this aim. By lectures, many of which treat of the different aspects of the woman question.—her culture, her social, judicial and even political rights,—through books, papers, reviews,* etc., Italian women are led to recognize that a high standard of social duties is necessary.

The majority of women do not believe that their active co-operation can be of any use in politics and are not desirous of the right to vote, for they know well how efficacious their indirect action can be, through their influence over the men of their own family and their friends. The influence of woman in the family is so strong in Italy, that the woman question in Italy is of the utmost importance and has to be solved in a manner essentially different from that of other countries. The Italian woman understands that she cannot and must not remain inactive in the fervor of the moral resurrection of her country, and if at times she seems inert and uninterested, it is because she works in silence, without pomp or parade.

It may be safely asserted that when properly educated the Italian woman is inferior to none. She differs only in temperament and its manifestations in daily life. Averse from participation in public affairs, she is yet an important factor in them owing to her personal influence, and there is no doubt that woman in Italy is becoming an important social power. Freed from many prejudices and misconceptions

---

A very good one *Vita Femminile* "Womanly Life" was started in Rome, January, 1907. It is edited by Sofia Bisi Al Bini, who edits also *Rivista Della Signorine*, an excellent periodical for young girls.

which have kept her far from the vital interests of the nation, she is now advancing in the full promise of a brilliant future.

COUNTESS FANNY ZAMPINI SALAZER,
Professor of English in the Royal Institute of Higher Learning for Women in Rome.

20. Italy—Language. *I.—The Literary Language.*—The Italian literary language has for a foundation the Florentine dialect, with which, more than with any other, it has in common not alone phonetics and morphology, but also syntax and vocabulary. In regard to its phonetics, which in this matter is of the greatest importance, it will be enough to say that Siena, which has had a certain desire to dispute the first place with Florence, has, as characteristics of its dialect, the examples,—*conseglio, gionto, cavallaria,* etc., which resemble the other Italian dialects and remove it from the Florentine (and literary) types:—*consiglio, giunto, cavalleria.*

It was proper (because of Dante, and also of Boccaccio and of Petrarch) that the Florentine dialect should become the language of Italy; and of these three great names, Petrarch deserves a place quite by himself, because the language of his 'Canzoniere' (Book of Songs) is generally much less idiomatic, and hence more largely Italian.

The literary tongue of Italy is founded, then, upon that Florentine dialect, a trifle archaic, of the 14th century, and has changed but little, partly from the respect for tradition, but more because the Florentine himself has not changed. The language of Dante is, without any serious differences, the language of today: there is no such thing as an old-fashioned Italian and a modern Italian.

Italian literature was the last to emerge among all the great Romance literatures, and its cradle was not in Tuscany. The cause for this tardiness can be found in part in the greater attachment which the Italians had for Latin. But probably certain negative conditions had more importance, namely, that in Italy there had not survived political and social conditions necessary for the development of the poetry of the laymen, or popular epic poetry. At all events, the language of the first school of poetry, of the time of Frederick II., which contains the southern elements and also to a certain extent the language of the later schools, of Arezzo and Bologna, left also evident traces in the language of the Florentine school of the *dolce stil nuovo* (soft new style), which quickly seized the sceptre of poetry, and these traces, although they are hardly discernible, have never entirely disappeared from our own poetic tongue.

The first document in that dialect, which from about 1290 down predominated in Italian arts, appeared in 1211, and naturally is not at all a literary document, being «Fragments of a Book of Florentine Bankers.» But after Dante, the Florentine had no serious adversaries. The linguistic unification proceeded slowly at first, so that Ariosto, not only after Boccaccio and Petrarch, but also after Poliziano and Pulci, by following in the steps of Boiardo, was able to write 'Orlando Furioso' in a hybrid tongue, which though seeking to be purely Italian, yet preserved phonetically and morphologically a great many Emilian elements.

However, now arrived the time when it acquired its rich vocabulary, its clarity, and so to speak, its theory, and that the language of the people (as used by Dante, by Boccaccio and by Petrarch) should become the new language of Italy, capable and worthy of a grammatical system as regular and as rigid as Latin. These three great Tuscan poets are Italian classics and are accessible to all Italians. And a kind of grammar of the popular tongue, founded upon their example, is the 'Prose' by Bembo in 1525. Ariosto, following the movement, changed the 'Orlando' written in the dialect of Emilia in the editions of 1516 and 1521, into the 'Orlando' of 1532, which was written in the Tuscan dialect and above all tried to be grammatically correct. The period of hybridism was finished, although some traces of it, not only morphologically, but also phonetically (*fameglia, gionto per giunto,* etc.), are continually found in writers who were not Florentines, and above all not Tuscans, during the whole of the 16th and also the 17th centuries.

It was then a question of vocabulary and particularly of style, and has so continued until our time. In discussing the name to be given to the language, whether Florentine, Tuscan, or Italian, etc., the earliest 16th century writers naturally did not distinguish in a particularly clear manner between phonetic hybridism and the rest; neither the Sanesi, who, against the exclusiveness of the Florentines, defended the customs of the whole of Tuscany and especially of Siena (and this continued rather late even to the time of Girolama Gigli, a writer of the 17th or the 18th century), nor Giorgio Trissino of Vicenza who desired to do his share in everything Italian. In the beginning of the 19th century, as a reaction against the ultra simple and colorless language of the 18th century, there arose a most strict school of the purest 14th century—a revival, which, although it was contested by Monti and by others in the name of a greater breadth and modernity in the choice of models, yet, having some merit, it helped to strengthen the weak and artificial academic quality of Italian prose.

Alessandro Manzoni, in his 'Promessi Sposi,' first issued in 1827, succeeded partially in restoring the model set by Ariosto; but so much the more for Manzoni was it a question not of phonetics but of style, and of vocabulary so far as it is necessarily connected with style. In place of a language which had become too literary, he wished to substitute a language which, like the French, should be fresh, natural, precise. Thus he became the most enthusiastic and convincing, and altogether the most logical and coherent of the advocates of living usage and consequently of Florentine speech. He thought that all the Italians, in order to possess a language not only alive and copious but free to all and by all equally understood, no matter how delicate or slight the meaning, and in all its more specialized usage—just as the French have done—should follow the usage of cultivated persons of Florence. Thus there came, before all, a renewal of the vocabulary; but following on this were added naturally some phonetic

modifications, such as the substitution of *o*, which to-day the Tuscans pronounce, for *uo*, an archaic survival from the literary language. From this resulted (due to the work of the followers of Manzoni) a frenzy, so to speak, of Florentinism. But of all the noise made about it, there remains to-day only an echo in some recent books. Without any doubt, through his work and his example, even more than by his theories, Manzoni has assisted tremendously in reviving and infusing with new blood the ancient tongue, or—to speak more accurately—the ancient academic Italian prose; although it may be that their traditions have not entirely disappeared, and that the vocabulary of the members of the Florentine Academy of Letters (the Crusca) is too loyal to these traditions. And no one can doubt for a moment that he who wishes to speak or write well should pass a longer or shorter period at Florence or at least in Tuscany, because the language used in Italian conversation, being meagre or inexact in almost all the provinces, it happens frequently that even cultured people lack the habit of thinking with energetic spontaneity in Italian, whatever may be the subject of their thought. On the contrary, it is well understood to-day that a language is not renovated by those mnemonic exercises which were so dear to the followers of Manzoni, but only by copying and following beautiful and powerful examples. An entire nation, which lives in the present, can never entirely forget its past; and the unification of the language cannot be brought about by artificial means but only by the progressive and ever ascending blending of Italian spirit and Italian culture.

From the standpoint of philology, Italian is one of the Romance languages, which are a continuation of the Latin, of which they are, so to speak, the present phases; and, for certain qualities, for example, the loss of the final *s*, it could unite itself with the dialects of Rumeno and of Dalmatico (or the Roman language of Dalmatia now almost entirely disappeared), forming an eastern group to oppose the western group, composed of Latin, French, and Spanish.

Literary Italian, which belongs to Central Italy, is one of the Romance tongues which has preserved more abundantly and with fewer alterations the traits of the Latin as regards phonetics and the dictionary. One or another of the sister languages may have some partial advantage over this one; for example, the tongue of Sardinia, opposed not only to Italian but to all the dialects derived from the Roman, has preserved in its Tonic vowels a phase of Latin vocalism more archaic, we might say the phase of the time of the Republic, as opposed to that of the Sardinian Empire; and the preservation of the final *a*, which set to the French and to the Provençal the fashion of preserving more at length the traces of the Latin declension. But this and other similar observations cannot change appreciably the result of judgment as a whole; it must be remembered that Italian has preserved faithfully almost all the internal consonants, so that it can present an almost unchanged series such as *amate*, amatis, *mutare*, *credo*, *vidi*, *fedele*, *ripa*, *nipote*, *amico* (as opposed for instance to *segare*, etc.), *legare*. For the rest, the dropping of the final *s*, which undoubtedly once had a place in Latin vulgate, is not of special importance except as a part of a general phenomenon, *i. e.* the loss of all the final consonants; and this phenomenon, combined with the preservation of all the final vowels (to say nothing of the weak vowels in the middle of a word), has given to the Italian language its new and special character.

As to the dictionary, the Italian certainly comprises a goodly number of German derivatives, but incomparably less than the French, and furthermore, has no other ancient or foreign roots, in the way that Arabic is found in Spanish.

Among the preëminent qualities of Italian must be put that inner power of preservation which we have already mentioned. Whatever may be the cause—and only in certain parts can it be attributed to the power of literary tradition, that is to say, because its greatest masterpiece, the 'Divine Comedy,' was written originally in that tongue, and afterwards the 'Decameron' and the 'Canzoniere,'—but this among all the known tongues is the most tenaciously conservative, which is undoubtedly a great advantage, both morally and practically.

Italian is the literary language of the entire kingdom of Italy (with some restrictions among the Valdesi and the French-Provençal of Val d'Aosta), and also of some Italian subjects in Austria, some in Switzerland and some in Malta. Corsica alone prefers French for its literary productions.

The Dialects.—Italy is, in regard to its language, one of the countries most compact and homogeneous. According to the last census (1901) there were 32,413,647 subjects in the kingdom, of which only 261,500 were considered as speaking other languages; and they were 10,500 Germans (5,000 in Piedmont, 5,500 in Veneto); 34,500 Slavs (30,000 Friuli, 4,500 Molise); 96,000 Albanians and 30,700 Greeks; besides 80,000 of French-Provençals altogether; and 9,800 Catalanians in Alghero (Sardinia). There remains then 32,152,147 speaking Italian.

To these should be added, according to the computations of the best official reports, 702,173 in Austro-Hungary; 138,638 in Switzerland; 460,000 in France and England (Malta); a total of 1,300,000. The number of Italian subjects outside the kingdom may be roughly calculated as about 3,500,000.

Not all the heterogeneous population of the kingdom of Italy, can be considered as «colonies» or as «islands.» The following may be considered as «colonies» linguistically: (a) Germans of Veneto, of Tyrol origin (in the 13th century there was an emigration), who reformed themselves into the Thirteen Communes of Verona (reduced, it seems, now to two) and to the Seven Communes of Vicenza (now five at the most) and of Piedmont, around Monte Rosa and at the Simplon (12th and 13th centuries); (b) The Albanians, who form the most important group of foreign languages, not romance, in Sicily, in Calabria, in the southern provinces upon the Adriatic (from about half of the 15th century excepted); the last colony was Badessa in Abruzzo Teramano (1744); (c) The Slavs in Molise (but the Slavs in the Province of Udine continue to the Austrians); (d) The Greeks, from Otranto (9th and 10th centuries); and reduced to very

few in Bova in Calabria (11th century). In Corsica, at Cargese, 650 Greeks settled in 1675.

Roman Colonies: The Catalanians of Alghero, of Barcelona origin (1353–72); the few French-Provençals of Faeto and Celle (of the time of Carlo d'Angio) near Foggia (see following text for the Provençals of Guardia Piedmontese in Calabria, for the Lombards in Sicily, etc.); and finally about 3,000 Rumeni in eastern Istrie, now strongly Slavic in its language.

But to pass over the Semitics in Malta, we cannot call colonies the Provençales and the French-Provençales of the Alps, who keep up the idioms of the other slope. The boundary between the Ligurian and the Provençale is to be found at the Roja: Mentone, and around there, is more Provençal than Ligurian. They may become Provençals—or they may continue many of the Provençal expressions, mixing with them Piedmontese and local words — the dialects under the Maritime Alps and the Cozie, down to the Monviso—to the right of which are the Valli Valdesi (Pral, etc.), with a dialect allied to that of Delfinato more to the east,— and also more south toward the high course of the Clusone and to the sources of the Dora Riparia. A colony of Valdesi (about 1,400), is Guardia Piedmontese in the province of Cosenza.

From the district so influenced by the Provençal, we pass by some intermediate grades, to that which is plainly French-Provençal, above all in the valleys of the southern Stura, of Orco (Val Soana), of the Dora Baltea (Val d'Aosta). In the Val d'Aosta the French-Provençal has its stronghold, so that the language of culture is French. Then follows the Valsesia, plainly Piedmontese or Piedmontese-Lombardian, which forms a sort of dividing wedge between them and the successive Alpine districts of various linguistic types. It is the Ladin dialect which is found in these parts, and the mountain inclines to the Ladin dialect more or less from Mount Rosa farther. From these Lombardy valleys, and especially from the more western, from Toce and from Maggia, alike, come the so-called Lombards of Sicily, of Sanfratello, etc. (11th to 13th centuries).

The Ladini of the southern slope of the Alps are to-day reduced to very few in number (40,000 Grigioni), losing touch with the Ladini of Italy. To these belong entirely the small central zone, or Tridentine-Bellunese, and that which is incomparably the most considerable, the eastern, that is the Friuli. In official documents the Ladini are considered to be among those who "speak Italian." Here, in fact, there is no sign of that literary language which the Ladini of Switzerland have; and on the other part nearly half a million Friulani (with about 11,000 in the central zone), form up in the southern part of the Alps a so strong, flourishing, linguistic union, opposed to the few Grigioni, that man could well consider the Ladin an Italian language. At a time not so far distant there was a Friulano dialect as well as a Trieste dialect and a Muggian, now Veneto; at Trieste they still spoke Ladino in the first half of the 19th century; and at Muggia also in the second half.

We now come to the dialects which are accustomed to be considered as Italian.

Dante, in his division of Italian dialects ('De Vulgari Eloquentia,' I, x fg.), which is perhaps the first attempt at any classification of dialects, divides them according to the two slopes of the Apennines, the Tirrenian and the Adriatic, and counts them off into 14 principal types, seven for each slope. It was without doubt a happy thought, and almost everywhere throughout southern Italy the division of Dante's is similar to our own. We will commence with a general division into four groups: Northern, central, southern and Sicilian, and finally, by itself, Sardinia.

A. *Northern Italy.*—1. The group so-called Gallo-Italiano, that is, (a) Ligure, (b) Piedmontese, (c) Lombard, (d) Emiliano (including the Romagnolo dialect). The most "Gallic" is naturally the Piedmont; the nearest to the Tuscan is the Ligure, but Liguria, Piedmont and Lombardy form the territory of the *ü* and the *ö* continuing the French type. Emilia in turn is the true home of the *e* for the Latin or Tuscan *a*. This peculiarity appears until we reach Metauro, and pass into Tuscany, into the Aretino dialect. Let us not forget the Genoese colony of Carloforte in Sardinia, and those Emilian colonies in Lucchese, of Gombitelli and Sillano.

2. Eastern Dialects: (a) Istriano, little better preserved at Rovigno and Dignano. It is a very characteristic dialect, with features which recall the Veglioto or Dalmatian dialect, and the dialects of the southern shore of the Adriatic. (b) Veneto, or better Venetian. And among all the dialects, none that arose has had more conspicuous fortune, following upon the arms and the commerce of the great Republic; here certainly its progress followed its family resemblance with the Tuscan, for the most part original but to a certain extent borrowed. To say nothing of its fortunes in the Levant, we must make mention that it conquered territory everywhere, in all the cities of the country that surrounded Venice, in Friulano and Istriano. In Venetian, which in its oldest documents shows a trace of Ladino, neither *ü* nor *ö* ever appears; nevertheless there is a strong tendency to drop out the weak vowels; they have the diphthongs *ie*, *uo*, etc. Very characteristic of this dialect is the aversion to double consonants, that is to say that there, as in Rumeno, the vowel is as long again as before the simple ones.

B. *Central Italy.*—1. Tuscan, with the dialects of Florence and those to the west, Pisa, Lucca and Pistoia; a little aside the southern Senese and then Aretino, of which we have spoken. The western dialects have, for example, *giunto*, like the Florentine, but especially at Pisa and Lucca is the use of *s* for *z* very noticeable, and at Lucca *r* for *rr*, which recalls the Ligurian dialect, etc. For the rest, the cities are all strongly under the influence of Florence. The quite prevalent opinion that at Siena they speak an Italian better than that of Florence, comes perhaps from an arbitrary interpretation of the old saying, already common in the 17th century, "Tuscan tongue in a Siennian mouth." The characteristics of the Florentine and Tuscan language of to-day which most strike one accustomed to the Italian of the other provinces, are perhaps the substitution of the simple *o* for the diphthong *uo*, as

bono for *buono;* the aspiration of the guttural *c* among the vowels, *baho,* for *baco, la hasa;* and, we may add, also the pronunciation of the palatal *c* between two vowels, *fece, la cena,* which differs from the explosive *c* following a consonant, as *calce,* etc. But if the Tuscans themselves freely recognize the aspiration of the guttural *c,* as pertaining to a dialect, they will with difficulty arrive at a recognition of the same thing in the Fricativo *c,* and it displeases them that the latter substitute the explosive *c.* We must also mention the doubling in syntax, as *a ccasa, a rRoma.*

2. Umbro, Marchigiano, Sabino, Aquilano, Roman. This is a group somewhat roughly formed. Dante distinguished, besides the Tuscan, the dialects of Ducato, namely the Spoletano, and those of Rome on the right slope; Marca Arconitane (between Calabria on the south and the Romagnolo toward the north). Especially, the Romagnolo (as they appropriately term the Tuscan-Umbro), descends much further down the southern marches, and though it loses its more pronounced characteristics, like the *é* for *á,* it joints with its latest offshoots at the Ésino, at Jesi, (*amigo, pagado*) and also at Ancona (*poga,* poca, *fighi; sonéto,* sonetto, etc. Perhaps the Spoletano appeared to Dante characteristically for its final *u,* which is usual from the Umbria of the southeast to the edges of Tirreno, and also belongs to Sabino and Aquilano, but not to the western zone of Orvieto, Viterbo, Rome, Velletri. Certain southern characteristics, such as *nn* for *nd, mm* for *nv, mb,* etc., may be said to be common to all of central Italy, except Tossana.

3. Corso.—If it were not for its geographical position, it would be better to place it in this group between 1 and 2, but it has also very close relations with the Ligurian dialect, and naturally as we go further south it comes closer to the Sardinian tongues.

C. *Southern Continental Italy.*— Tirreno Group, or Neapolitan, which extends to the other slope with Molise. The final vowel determines the accented vowel, but this final vowel which at one time had to be *u* or *o, i* and *e,* is now restricted uniformly to an *e,* which we will call mute, according to the French custom: *ome* from *omo,* man, *uomene* from *uomeni; parente,* plural *pariente: porte* from *porto,* I carry, but *puerte* for ports; *negra* but *nigre,* black and blacks, *sposa* but *spuse,* bridegroom and bridegrooms. We pass over the fact that it has besides *nn* from *nd,* etc., and also *nd* from *nt, mb, ng* from *mp, nc,* but everyone knows nevertheless the characteristic types *chiane* and *sciure* for the Italian *piano, fiore,* which continue in Sicilian, *chianu, sciuri* (also in Genoa, *cian, sciu*); and finally that splendid example of synetical phonetics, *ne vasce,* un bacio (a kiss), or *a bbasciá,* etc.

2. Adriatic Groups.—Types of the Abruzzi, which comprehend the Capitanata. The foundation is the Neapolitan type, but the examples of the modification of the vowels are more than ever varied and complicated, and the accented vowels disguise themselves and become diphthongs in the most singular manner. Here, as in Sicily, the accenting of the period plays an important part, so that the tonic vowel is treated as being weak, if the accent of the entire phrase is not placed upon it.

D. *Sicily,* with which we will unite Calabria: some of their peculiar traits extend to Terra d'Otranto. The consonants are often treated as in Neapolitan, but nevertheless display their own peculiarities. But the Sicilian type has its own peculiar forms for the vowels especially; for instance, in place of the closed *e* or closed *o* of the Italian and the Romance tongues it employs an *i* or a *u: pilu,* pelo, *suli,* sole. As for the diphthongs *ie, uo,* they depend rather upon the accent of the period rather than that of the words. (See C, 2.)

E. *Sardinia.*—The language of Sardinia can be considered as a type by itself, at least as much as the Ladino. Here Dante expressed the truth very delightfully: "(Sardi) qui non Latini (=Italiani) sunt, sed Latinis adsociandi videntur." ("The Sardinians are not Latins but are seen to be associates of the Latins.") The most unmixed type of Sardinian, and hence the furthest removed from the Italian, is that of Logudorese or the dialect of the central part, to which nevertheless the southern or Campidanese dialect joins itself very closely; on the contrary, we are far removed with the Gallurese which forms an intermediate passage from Sardinian to Corso, and hence to Italian; and it is a most excellent example of the rapidity with which, in so short a geographical space, one linguistical type can be joined to another absolutely different, and also of the uncertain and arbitrary character of each classification. Characteristics fundamentally Sardinian, which distinguish it from all the other Romance tongues; it preserves intact the quality of the Latin tonic vowels, that is, each *e, i, o, u,* is here preserved as *e, i, o, u: fide,* instead of *fede, ruge, croce;* no fusion, therefore, of the long *e* and the short *i,* of the long *o* and the short *u;* and, moreover, no diphthongs. In the consonants, it is most noteworthy that the Logudorese preserve intact the guttural pronunciation of the Latin *ke, ki, kelu,* cielo (sky); although probably the course is only that like the Sardinian dialect, after having inherited from the Latin vulgate, like all the other Romance tongues, a *ke ki* somewhat influenced by the palate, did not go any further in that direction; and, in short, at a relatively late date, that is, toward about the 13th century, the Sardinian tongue lost also the above mentioned traces of the palatal pronunciation of the Latin vulgate. As an instance which connects the Sardinian district with the Iberico, which has the effect of giving it a certain right to be considered as common ground of transition between the eastern Roman group (Rumeno, Dalmatico, Italian), and the western (Ladino, French, Spanish), and especially of the transition from Italian to Spanish; the Sardinian preserves intact, in the very same way as the Spanish, the final *s* of the Latin; for instance, *fizu, figlio* (son), *fizos figli* (sons), that is *filios.* As an article the Sardinian has adopted *su,* from *ipse,* rather than a derivative from *ille.*

The dialects, of which we have finished the catalogue, are all, except the Tuscan, sufficiently alive and important from the standpoint of culture, because in Italy even well educated people usually speak the general dialect with their companions; but not particularly the local dialect, because each of the many small

states into which the Peninsula was divided for so many centuries, or at least each of the principal states, developed to a certain extent a language particularly for conversation, which is at the bottom the dialect of the capital city; thus the cultured Piedmontese usually speak the language of Turin, the inhabitants of Veneto, Venetian dialect, etc. And many of these dialects have had a rich poetical literature; although the writers in these dialects were almost always conscious of having produced works purely local in character, and considered their own writings, in opposition to those in the literary tongue, almost like a joke, so that generally they wrote only in a facetious tone. None the less it should be for us to make some distinctions; for instance, the Venetian, which was also the official language of the Republic, was certainly in the mind of Carlo Goldoni, something more important than a simple local dialect, since in this he wrote some of his best comedies; Sardinia and Sicily also show special conditions. On the other hand, the tone and playful intention take away nothing from the artistic seriousness of a true poet; and Carlo Porta of Milan and the Roman Gioacchino Belli were certainly poets of the first rank, marvellously representing with cunning satire, the life of their time in Milan and in Rome. To-day the flowery dialect continues; but the Venetian theatre has an importance more than local, and to-day is supported, both from the excellence of the dialect itself, easily intelligible to all, and because of the happy continuation of Goldoni's comedies, as Gallina was above all, and also because of the splendid acting. Little is heard of the Piedmontese theatre, which enjoyed much favor at the time of the formation of the Kingdom—and the theatres of Milan likewise depend upon a Milanese actor. The Neapolitan dialect is carried throughout Italy by the charm of its melodies and its voluptuous but sad little songs, but Roman poetry has acquired great popularity everywhere, and this is partly due to the ease of the dialect of to-day, and partly to the Roman poets, especially Belli, but above all to that great and noble artist, as rich in epic and lyrical powers, as in popular and pleasing comedy—Cesare Pascarella.

E. G. Parodi,
Professor of the Comparative History of the Classic and Neo-Latin Languages, Royal Institute of the Higher Studies, Florence.

21. Italy—Italian Literature. This article deals with (1) The beginnings of Italian Literature; (2) The age of Dante, Petrarch and Boccaccio; (3) The Renaissance and Humanism; (4) Classicism and Decadence; (5) Arcadia and Rennovamento; (6) Contemporary period, the *Terza Italia.*

FIRST PERIOD.—FROM THE «ORIGINS» TO THE 14TH CENTURY.

Italian literature was late in its beginning, although manners were more refined and the intellectual level higher in the Italian Courts and *Communi* than in the feudal castles of France of the same period. And the League of the Northern Cities against Barbarossa's invasion, the *Vesperi Siciliani,* the organization of *Communi,* the struggle against the encroachments of the Roman Church, the commercial activity of Italian seaports, the establishment of Tribunals of Justice and City Councils, all testify to a comparative maturity of the national spirit. In France 'La Chanson de Roland' was familiar to the Norman invaders of England in 1060; while the first original piece of Italian poetry, 'Il Contrasto di Ciulo d'Alcamois,' is approximately dated 1231.

This late development of Italian literature is chiefly due to the persistence of Roman civilization, and the general use of Latin as the written language. For in spite of the many invasions of the Peninsula, the Italian stock is not a recent blend. It is the permanent Roman nationality, and the permanent Roman character. That the tradition of intellectual culture was never interrupted, is evidenced by the number of Latin writings even in the darkest periods of the Dark Ages, showing that the Peninsula has never been without some intellectual light. The Empire and the Church, those two supreme powers of the Middle Ages, encouraged respect for the Latin, by using it as the official language, and thus contributed to the contempt in which was held the spoken language,—*Volgare.* Even after the noble compositions in Italian, of *Trecento* (14th century), both Dante and Petrarch used Latin in their scholarly writings. This Middle Age Latin literature and the gradual change from *Latino Rustico* to *Volgare Rustico* are considered in the article on the Italian Language. Though the *Volgare* was the latest of the Neolatin idioms and was everywhere used, even by the learned in familiar conversation, it was not until 1231 in the *Contrasto* that it found its way into literature. Yet so rapidly was it perfected by Dante, Petrarch and Boccaccio, that in Dante's *Commedia* (1300) Italian attained its splendor and perfection earlier than any other European language.

The feudal ideal of chivalry, imported from France and Germany and unsympathetic to Italian tradition, also retarded the development of a national literature. The *trouvères* of *langue d'oel* and the *troubadours* of *langue d'oc* poured across the Alps and were welcomed by princes and common people. Everywhere these invaders scattered the ideas of their country, and the ideals of their legends. So numerous, noisy and popular were they that the city of Bologna in 1288 passed a law forbidding *quod Cantores francigenarum* from dwelling near the Town Hall and disturbing the Council. Imitators of the French *gaie science* flourished everywhere, as Albertino Malaspina, Rambertino Buvalelli and the Mantuan Sordello whom Dante mentions. After the bloody *croisade des Albigeois* many troubadours sought the protection of the Emperor Frederick II. of Sicily. Many other intellectual forces sought the support of that enlightened prince who welcomed *Gli uomini che avevan bontade giucolicre, sonatore, e trovatori.* On account of the learning and culture that came pouring in from all parts of Italy, the *volgare* used at the Court of Frederick was more refined than that used in Naples or in the northern part of Italy, and more free from Latin than the Florentine dialect. And here in Sicily arose the first school of Italian poetry.

There was little originality and less genuine

sentiment in these first productions of that school variously named *Provençal, Sicilian,* or *Aulico cortigiana.* It was an imitation in both matter and form from the French model. The sonnet alone where two *strambotte* are joined, is original; otherwise the forms are the *ballade,* the *pastourelle* and the *sirvente* of the troubadours. Probably anterior to these is the much discussed *Ciulo d'Alcamo,* or *Cicto Dulcamo,* with its charming dialogue between an eager lover and a reluctant but finally yielding sweetheart. The first entreating lines *Rosa fresca aulentissima C'a pari in ver l'estate* are better remembered than the realistic and more sincere conclusion. The name *Scuola Siciliana* survived the quickly vanished magnificence of the Court that fostered it. The Tuscans who had lived in Frederick's Court, or corresponded in *Tenzoni,* were known as «Sicilians.» Folcacchiero dei Folcacchieri in Siena and Monte Andrea are remembered as «Sicilians» of the second period. To Guido Guinicelli (1240—?) Dante allows the merit of opening a new field of poetry and of giving in the celebrated *canzone Al cor gentile ripara sempre amor* a new ideal afterwards called *Il dolce stil nuovo.* Guinicelli, whom Dante calls *Padre mio e dei miei migliori,* went from Bologna to Florence, and inspired poets who introduced the *spiritelli* (impersonations of love), in which there is some psychological analysis and much mannerism. The *Canzone* 'Donna miprega' of Cavalcante (1260—?) is the most perfect of these. It is a complete scholastic treatise on love's psychology.

The asseveration that the Italian mind is never deeply religious is disproved by the mystic religious poetry which blossomed during the Middle Ages. It was almost localized in Umbria and was chiefly inspired by that gentle apostle of poverty and love, Saint Francis of Assisi, and his followers. Like manna to the hungry were the verses of the *Cantico del Sole,* and many a humble soul was inspired to imitate the *Laudi* of which every religious Brotherhood had its own sacred stock. Jacopo Benedetti, known as Jacopone da Todi, is the best known of these religious poets. His 'Laudi' which he called *sacra pazzia* (holy madness) consist of endless exclamations and repetitions of tender worship of the Madonna and supplications that God should severely punish his sins.

The prose works of this period were mostly written in Latin or French and do not form a part of «Italian» literature. 'Tristano' is perhaps the earliest Italian version of those *Chansons de Geste* usually written in poor French. The 'Buovo d'Antona' and the 'Storietta di Troia' are mere translations and adaptations. There is more originality in the 'Novellino,' where, though the Bible and French *Fableaux* furnish most of the material, there is also mingled a certain amount of local color. 'Il Libro dei Sette Savi,' the Italian version of the Seven Wise Men, first told in India, and repeated in all the literatures of Europe, is an interesting example of the common source of all literature, and the intimate relations of migratory peoples. The few *Croniche* are historical works where imagination frequently supplies the place of fact. The *Fiori* are confused and pretentious aggregations of information about many things. Guittone d'Arezzo's 'Epistles' are the first example of that pompous Latin elegance and correctness so often affected by later writers of Italian prose.

IL TRECENTO, 14TH CENTURY.

If the 12th century was the early springtime of Italian literature, a time of seed-sowing and germination; followed in the 13th century by the first fruits of the harvest; then the 14th century may be considered the glorious summer of fruition. Before the opening of *Trecento* the foreign forms and ideas had been assimilated, transformed by Italian genius. Epic and lyric poetry, romantic and historic prose, were now Italian in character. Guido Guinicelli and Guido Cavalcanti had initiated the *Dolce stil nuovo;* Guittoni d'Arezzo had written the first pure and stately Italian prose. And now began the century made glorious by Dante, Petrarch, and Boccaccio.

DANTE.

The facts of Dante's life belong to history, but the vicissitudes of his love, the evolution of his soul, stand within the compass of literature, they explain and reveal his immortal work. He was nine years old when first he met Beatrice, a child of eight; nine years later he again met her in the street, and was favored with her gentle *saluto.* In that instant love mastered his soul, Beatrice was the only object of his thought. The death of Beatrice did not break the charm, though for a moment Dante was attracted by a gentle dame who with him bewailed his great loss; but soon he returned to his worship of Beatrice's memory. 'La Vita Nuova' records the incidents and emotions of his love for Beatrice. Through these sonnets and *canzoni* linked together by prose comment, runs a vein of tender melancholy, a spirit of transcendentalism. The canzone *Donne che avete intelletto d'amore* is in the *Dolce stil nuovo* introduced by Guido Guinicelli, with a metaphysical deification of feminine beauty as an emanation of Divine Love as a means of salvation. The sonnets 'Vede perfettamente ogni salute,' and 'Tanto Gentile' are gems of lyric poetry, and the vision *Donna Pietosa* is of classic simplicity. After telling of his grief at the death of Beatrice, he describes his vision of her soul rising to the glory of Paradise amidst a choir of cherubims singing praises. In Dante's 'Canzoniere' are other beautiful lyrics, some with the same inspiration as in 'Vita Nuova' and others, known as *Rime petrose,* composed in a different spirit; perhaps inspired by a woman named Pietra. 'Convivo' (as the name signifies), is a «banquet» of spiritual food in the Italian language, for those who could not read Latin. Philosophy, astrology, morals, religion, a compendium of the Ptolemaic system, and a dissertation on the destination of the human soul, all are included in this feast; all presented in noble poetry and splendid prose. The *Canzone* 'Voi che intendendo il terzo, ciel movete' show how genius can transform dry dogmatic into a noble hymn of beauty. In 'De Monarchia' the question which then divided the world—whether the Church should dominate

the Empire—is argued from the Ghibelline (or Imperial) standpoint.

LA DIVINA COMMEDIA.

Though doubtless his other writings suffice to place Dante among those illustrious Italians whose composition will always be read, it is because of 'The Divine Comedy' that Dante ranks as the chief glory of his nation, crowned with the same immortality as belong to Shakespeare and Homer.

'La Divina Commedia' was called «Commedia» by Dante, «Divina» being added immediately after his death by his admirers, and since universally accepted.

Poets, painters and preachers before Dante had attempted uncouth description of the three realms of Punishment, Expiation, and Reward. Orcagna's frescoes in the Campo Santo of Pisa are a familiar illustration. From these Dante appropriated freely; his rich imagination and stern logic transforming all into a complex yet balanced harmony. The structure of the poem is simple and symmetrical in its *ensemble*, but elaborate in its detail. The *Inferno* is a huge inverted cone, opening directly under Jerusalem, its outside edged by *Anti-Inferno*, which in its turn is circumscribed by the river Acheron. The interior of this cone is divided into concentric rings (*cerchi*). In the upper, which is also the outer circle, the punishment is least, and increases in severity as in each successive descending concentric circle the sins to be punished increase in turpitude. The bottom of this cone is formed by the funnel in which Lucifer became wedged half way, hurled down head foremost from the *Emperio*. His beastly triple head is in *Inferno*, while his legs form the central point of the opposite mount of *Purgatorio*.

Opposite to *Inferno*, in exact but inverted symmetry, rises the mount of *Purgatorio*, divided into a sequence of terraces corresponding to the *cerchi* (circles) of *Inferno*. Each terrace contains a certain category of sinners, the lowest being the worst. As *Inferno* had an Anti-Inferno and a final city of *Dite*, so *Purgatorio* is preceded by *Anti-Purgatorio*, surrounded by the Eden or Terrestrial Paradise encircled by the rivers of Lethe and Eunoe that wash away every recollection of sin. *Paradiso* is also imagined on the plan of concentric circles, in accord with the Ptolemaic system. Only in these spheres of splendor the Blessed are not constrained to any fixed place, but soar freely from one circle to the other, and they all have their appointed seats in the mystic Rose, whose centre is God Himself.

The symmetrical harmony of the 'Divine Comedy' extends to every detail. Nine circles in Hell and Anti-Inferno, nine terraces in Purgatory and Anti-Purgatory, and nine spheres in Heaven and the Emperio. The two outer circles of Hell form the city of Dite, the last two of Purgatory the Terrestrial Paradise, and the last two spheres of Heaven the mystic Rose. The 33 Cantos are divided into three parts, the repetition and multiplication of these leading up to nine, the perfect number composed of the Trinity multiplied by itself. Each of the three parts ends with the word *stelle*. The material unity of this hugely imagined construction is shown in the line which, straight from the centre of the mystic Rose (centre of Paradise) forms the axis of mount Purgatory, passes through Lucifer's body and reaches Jerusalem. This symbolic line, reaching from God Himself, through the realms of glory, expiation, and punishment, to Jerusalem, uniting the Church triumphant with the Church militant, typifies Redemption. Lucifer, in falling from Heaven has formed the hollow of Hell, and the opposite mount of Purgatory was formed by the horror which made the very earth recoil at his passage. Salvation for a sinful world, starting from the Cross of Calvary at Jerusalem, conquers Hell and by the purifications of Purgatory reopens Heaven, the dwelling-place of God, to redeemed mankind. This unity of conception is continued in the three allegorical significations of the *Commedia*, the personal, moral, and political. Considered as personal to the poet, Dante's journey begins on Easter Day 1300, the Year of the Jubilee, and lasts seven days. Dante, then in middle life, finds himself in a forest in sight of a hill, sun-illumined at the top, his path opposed by three beasts,—his sins;—he is rescued by Virgil, who by Beatrice's command shows him the realms of punishment and expiation. In the political allegory Virgil, typifying the Power of the Empire, leads mankind through the realms of punishment and expiation up to the Terrestrial Paradise from whence Beatrice, signifying religion, conducts him through Heaven. In the moral allegory Virgil is human reason, Beatrice is Faith and all the Scholastic controversy is developed by Saints Thomas, Dominique and Peter. In *Inferno* these ghosts or shades endure pain in the flesh, hopelessly conscious that pardon is past praying for. In *Purgatorio* the expiating soul is comforted with the certainty of ultimate pardon and with bright visions of happiness. In Heaven the souls are no more shades but lights. It is an ocean as full of brightness as Hell was black.

Of the myriad beings who people these three realms of hell, purgatory and heaven, Dante's supreme creation is Lucifer. Indeed, this personification of Evil is the supreme intellectual conception of the Fallen God of all literature and of all time. Dante in some measure attained to and completed what Æschylus essayed. Dante's Lucifer is as repulsive as Milton's Satan is fascinating. All glory is alien to him; all things of sin are a part of and have their source in him. He is all-evil, Evil, pure and infinite, the author of all the sin mankind endures, the loathsomeness of his person, the vileness of his acts, the futility of the motion of his vast bat-like wings, the worst of the hugeness and horror are indescribable. "At each of his three mouths he with his teeth is crunching a sinner in the manner of a brake." Brutus, Cassius, Judas Iscariot! These are the three arch sinners whom Satan's teeth are champing. The first betrayed his king, the second betrayed his friend and king, the third betrayed his friend, his king and his God. And all about is ice and life-congealing winds, the intense darkness of the vast cavern in which the strange voices of Dante and Virgil sound alien, hoarse and hollow.

There are many other stupendous descrip-

tions in the *Commedia,* powerful apostrophies, withering invectives; the haughty words of Farinata degli Uberti, rising from his tomb; the piteous stories of Francesca da Rimini, and of Pia dei Tolomei; the description of the serpents growing into men, then burning down to ashes and forever repeating this atrocious torment; the appalling picture of the forest of withering branches weeping their intolerable misery in drops of blood. Shakespeare has more chords to his lyre, and Homer often rises to supreme heights, but with Shakespeare and Homer will ever be associated in an immortal triumvirate the name of Dante. He remains the chief glory of Italian literature, and a world poet of the highest rank. Cino da Pistoia, after Dante, the most delicate of poets *del stil nuovo,* has left many sonnets, ballads and *canzoni,* in which he sang his love for fair *Selvaggia.* His passionate verses alternate moods of joy and grief, and show some psychologic observation. Cecco Angiolieri writes with humor, despair and gaiety. There is also ample and interesting material in the prose writing of the time. The 'Fioretti di San Francesco,' a compilation of legends and sayings about Saint Francis of Assisi or attributed to him, are exquisitely simple and of deep piety. Dino Compagni's *Cronica,* and the *Cronaca* of the Three Villani's describes the world in which Dante lived.

Francesco Petrarca, 1304-1374.—If Dante was the last splendid representative of the Middle Age, Petrarch was the rising sun of the Renaissance. The first sang the mystic contemplation of other-world ideals, the second initiated the study and observation of the human heart and of terrestrial beauty, and was a prey to that contrast of moods which make him the first victim of pessimism in literature. Petrarch's love for Laura, his habits of elegance, his affection for rare manuscripts and classic authors, his craving for perfection of literary form, jarred cruelly with the religious sentiment which became supreme in his later years. In Petrarch's poetry there is a cry of human suffering, a sincerity of expression which separates it from any previous composition. 'Il Canzoniere' is a searching analysis of a single sensation, the psychology of a single soul. When Laura dies Petrarch's grief is a brooding melancholy, less ascetic and more tender than the devotion professed by other poets of the *stil nuovo.* There are many chords in Petrarch's lyre, and Laura's praise is sung in many moods.

'I Trionfi,' an allegorical poem mostly in *terza rima,* narrating the triumph of Love, Death and Fame, is a continuation of the *Canzoniere.* Petrarch is the poet of love, but he is also the first Italian poet who has intensely felt and sung of patriotism. He dreams of an Italy direct heiress of the Roman Republic of Scipio, powerful in the liberty of Communes; yet he perceives that a national monarchy is the best available form. In Petrarch's writings there is an exaggerated attention to form, though it never quite becomes mannerism as it does with his imitators.

Giovanni Boccaccio, 1313-1375.—Boccaccio was a scholar possessed with the imagination of a poet, a ready wit and the charming manner which secured for him, the bastard son of a merchant, the welcome of princes and the love of a princess. His comprehensive soul and rich nature epitomizes his age and country. He is delighted with the discovery of an ancient manuscript, first realizes the greatness of Dante's poem and spreads the knowledge broadcast; yet though abounding in literary work and scholarly study he finds time for business and also for public affairs. 'Il Filocolo,' 'Filostrato' an 'Il Ninfale Fiesolano,' are praiseworthy stories, overcharged with ornament; but 'Fiammetta' is a literary event, the first psychological novel. Only Dante's 'Vita Nuovo' had contained such subtle investigation. 'Fiammetta' is Boccaccio's own love story, and possesses an accent of sincerity that all the borrowed elegance of Latin models cannot disguise.

The 'Decamerone' is Boccaccio's immortal masterpiece. Over Florence (1348) hangs the horror of the plague. In a delightful villa outside the city a company of gallant youths and gentle maidens have gone for safety, and to seek distraction from thoughts of death and disease through present enjoyment, and the telling of tales. The party of ten, during ten days, tell one hundred stories. A crowd of personages are introduced; the diversity of situation, the fertility of invention or of adaptation, the abundance of familiar detail give us unsurpassed pictures of Neapolitan and Florentine life of the time. Knights and princes, artists and poets, gentlewomen and merry wives, friends, friars, hostel-keepers, shrewd merchants and lusty clerks, all move and speak in the gay medley of real life. The attacks on the clergy were warranted by their immorality, and Boccaccio's obscenity completes his picture. He borrows from all sources, chiefly from French *fableaux,* with the one purpose of correctly representing the real world around him; its interests, its virtues, its vices. He is a pagan, as are the shrewd, prosperous Florentine pagans about him, those whom Carducci calls *il popolo grasso,* enjoying life and indifferent to any future finality. His only reverence is for Art, which he worships so ardently as to have given to his own work a correctness which ranks him as one of the intellectual triumvirate that molded the Italian languages, and even the very spirit of the Nation.

In perfect contrast with the irreligious and artistic world of Boccaccio and his imitator Franco Sacchetti, and their disciples, loomed a great ascetic spirit, an inspired apostle, who subdued the fiercest and humbled the proudest, by declaring the simple message of Jesus Christ; an illiterate woman of humble birth, Santa Caterina da Siena. Unquestioned faith in herself and her holy mission gave authority to her word, eloquence to her epistles and reminiscences, most uncommon among Italian writers of that or any other period. It is another miracle of the power of Faith.

IL QUATTROCENTO—15 CENTURY. THE RENAISSANCE.

If the *quattrocento* (15th century) seems to have produced little that is memorable in Italian literature, the barrenness is only seeming. It was a seed germinating century, wedged in between the glorious 14th and the brilliant 16th

century. A century of progress in classical studies, a period notable in the evolution of the National conscience. Petrarch and Boccaccio only a little forestalled their countrymen, and 'Humanism' soon spread over all Italy.

Whether the word «humanism» be given its Latin signification of gentleness, courtliness; or is understood as emphasizing the human rather than the religious ideal, it equally accorded with the Italian 15th century spirit. A spirit of rebellion against the papal and imperial influences which dominated the Middle Ages. Italians have always claimed to be the inheritors of the Roman world, and to have uninterruptedly continued the classic tradition, and the claim was certainly justified at this time, when Latin civism was asserted in the free *Communi,* when emphasis was given to the Latin language, and when under the patronage of Cosimo de Medici, in the *Accademia Platonica,* meeting in the villa belonging to Marsilio Ficino, learned scholars and philosophers in purely pagan spirit, disputed respecting Plato's and Aristotle's dogmas. Some timid priests, it is true, opposed this humanism, which, with its pagan myths, philosophic inquiry and sensuous beauty, threatened the Church's supremacy. But soon scholarly and epicurian prelates and popes (Niccolò V. and Pio II.) were themselves seduced by humanism, and turned the current of reviving philosophy and letters to the adornment of the Church, if not to the increase of her faith.

These literati were obsessed with admiration for letters and ancient manuscripts and especially for elegance of Latin style. Yet they were more than mere pedants. Working away from the individualistic ideal of the *trecento,* they broadened the range of studies, in the universal Latin language which they called *Lingua Nostra,* opened a large field of investigation to the human intellect, now released from the limitations of scholasticism, helped the progress of humanity, and taught princes and potentates to pay homage to learning. The second half of this century was marked by the fall of Constantinople, which left Italy the sole surviving warden of classical tradition and its princely Courts the only asylum for fleeing scholars and philosophers. The invention of printing spread learning and literature among large numbers. The splendor of newly established courts, each eager to make the people forget their former liberty; in Rome the returning Popes, in Naples the House of Aragon, in Ferrara the Este, in Florence the Medici, and others only less bright because of their lesser importance, all exerting their influence for the glory of letters.

Neapolitan literary life was in the beginning aristocratic, Latin, and scholastic; a concourse of rhetors, grammarians and linguists, of whom Gioviano Pontano (1426-1503) and Jacapo Sannazzaro (1458-1530) are types. Pontano's hexameteric 'Lepidina,' and hendecasyllabic 'Seu Baiæ,' imitate Ovid and Catullus, and sing of lustful love. Sannazzaro's 'Arcadia' presents with more refinement scenes of pastoral life, pictures of innocent gaiety and simple stories of love veiled in melancholy. Florence was not more world-famous for her commerce, than for her glorious triumvirate of *trecentist* poets, and for possessing the literary language. In the Florentine crucible classic and Christian ideals were fused, and from her alembic issued the most perfect examples of humanistic literature. Lorenzo de Medici correctly represents these Florentines over whom he ruled. His admiration for every form of beauty, every phase of human thought; his preference for classic forms, his predilection for pompous and bright pageantry, even the drinking songs (*I Beoni*), which he composed in the solemn, almost religious metre of *terza rima,* are typical. Because he so completely impersonated Florence, Lorenzo de Medici loved Angelo Poliziano (1454-1494) and Luigi Pulci (1432-1484). Poliziano, beginning with Virgil, rifled his gems from all poetic caskets; yet with such gift of assimilation that his *Stanze* are more than mere stolen mosaics. Pulci's 'Morgante' is also a rare product of imitation and assimilation, an endeavor to make ideals imported from chivalric feudal France blossom in democratic Italian atmosphere.

But this chivalry of the North, which in the two preceding centuries had so poorly flourished in the soil of Roman civism, in the 15th century degenerated into the vulgar poetry of wandering *cantastorie,* catering for the amusement of unheroic *popolani* in the piazzas; and of such farragoes of heroic episodes and pseudo-history as 'I Reali di Francia,' which even in this 20th century is still read in many rustic Italian households. Sceptic scholars like Pulci used these popular errant knights, giants, and enchanters as a convenient framework for their own image weaving. Count Matteo Boiardo (1434-1494), of aristocratic Ferrara, treats his chivalrous heroes with respect. He adorns his stories with classical embellishments, and prefers the gentle knights of the Round Table to the stern warriors of the *Chansons de geste,* as is indicated by the very title 'Orlando Innamorato.'

There could be no lyric poetry in this age which ignored the charm of intimate self-communion and was content with the popular *canzonetta* and *rispetto,* or with pedestrian imitations of Petrarch. The religious drama (in a century in which the solitary voice of Savonarola cried in the desert) became an anachronism. Soldiers with muskets stalked through the scenes of the Sacred Passion and angels lisped the prologue. Even the popular 'Santa Uliva' is without literary value. Discarded by scholars, used only for familiar epistle or merry *novelle,* Italian prose only reaches terseness in the instructive writings of artists like Leon Battista Alberti (1407-1472) or Leonardo da Vinci (1452-1519), careless of literary form; and in a few such passionate orators as Savonarola and San Bernardino da Siena, whose eloquence is inspired by the intensity of their convictions.

IL CINQUECENTO.—16TH CENTURY.—CLASSICISM.

The *trecento* which witnessed the disintegration of feudalism and the partial destruction of ecclesiastical domination—those two foes of Italian Nationalism—produced Italy's chief literary glory, Dante's 'Divine Comedy.' The

quattrocento replaced the mystic Christian Idealism of the Middle Ages with purely pagan ideals of human happiness and beauty. It established Italian as the literary language in place of the discredited Latin, witnessed a literary assimilation of classic ideals with modern observation, saw an unparalleled development of the artistic sense, a refinement of manners and a fastidious taste which penetrated every part of the Peninsula. The *Cinquecento* witnessed the decline of Italian Nationalism. A French army invaded Italy (1494), Rome was sacked (1527), Florence fell (1530) and Charles V. was crowned in Bologna (1530) by Clement VII.; strange contrast with so splendid an era in Italian Arts and Letters! Political disintegration coincided with the integration of the national language, and the spread of national literature. This age of foreign and civil wars, of broken confederacies, of traitorous leagues, is the age of the establishment of new æsthetic ideals and forms of composition, and of that sense of finality which indicated the maturity of Classicism. Erudition, disciplined by antiquity, curbed extravagant attempts to create new literary forms. The *Cinquecento* had all the perfection and all the limitations of undiscussed classicism and aristocratic culture. Popular elements of inspiration in stories of chivalry, sacred dramatic representations, and popular forms of composition, like the *ottava,* the *canzonetta,* the comedy, were assimilated by courtly men of letters and the common people retreated from important participation in literary productions.

Machiavelli, Ariosto, Aretino, Cellini, Tasso, represent this 16th century.

Niccolo Machiavelli (1649-1527) is the product of this age. He impersonates that fundamental element of the Italian character—the spirit of ancient Rome. His admiration is for strength and its result—success. The greatest sin is weakness and failure. The weakling, possessing velleity without power to compel accomplishment, is despicable. Careless of religious dogma, indifferent to moral teaching, the end always justified the means: The welfare of the State is the *suprema lex* under his intent observation personages become meaningless appearances, events become important, and beyond the passing phenomena he perceives the everlasting law.

The Florence of the Medici shared Machiavelli's unprejudiced views, and even his apparent contradictions. He planned the institution of a republic in his 'Discorsi,' yet in 'Il Principe' hailed the advent of the masterful tyrant, who like Cesare Borgia would shake off ravenous invaders feeding on the vitals of Italy, and, unrestrained by any obstacle or moral consideration, would accomplish the unification of Italy; and Machiavelli's fellow-citizens connived at his partiality in retracing historical events in 'Storie Florentine,' since the inaccuracy best served their purpose. In the comedy 'La Mandragola,' Machiavelli, with genuine psychological observation satirizes contemporary society. Though the argument is obscene, there is excuse for unmasking perverted and perverting friars like Fra Timoteo, and in exposing the evil influence of an immoral priesthood on simple-minded women. Francesco Guiciardini (1483-1540) though his history is better constructed than Machiavelli's and more accurate, is an opportunist. He submits to the oppression of unavoidable despotism, and impersonates a weaker generation. The 20 volumes of his 'History of Italy' comprises the important period of the competition between France and Spain.

If Machiavelli typifies the intellectual Roman element of the Italian race, Ariosto, Machiavelli's contemporary, represents those foreign elements, medieval and poetical, which are also a part of the Italian mind. Though he, too, is familiar with classicism and Latinity, they are acquired qualities. It is the legends of chivalry, the *chansons de geste* and epic poems, which fire his imagination; and he expresses his poetry in the popular rhyme of the *ottava.* Ariosto's poetry is bright, spontaneous, sparkling. *L' art pour l' art* was the ideal of this diligent toiler, who without passion, faith, patriotism or religion, yet labors unweariedly to produce artistic beauty. The world he represents, the society that first inspires and then admires his work, equals him in indifference to moral and religious ideals. The 'Orlando Furioso,' Ariosto's masterpiece, is an accurate résumé of *Renaissance* sentiment. The paradise of pastoral simplicity which he describes, is opposed to the Court slavery under which he is restless. In Italy chivalry was not a tangible reality but a traditional fiction, a fabric of the imagination to inspire popular minstrelsy and courtly poets, and held together by the gossamer links of a code of gallantry. Chivalry, like *Cinquecento* mythology and religion, could no longer inspire heroic deeds or write epic poetry. Raphael with equal earnestness painted a Madonna, or a Galatea, and Titian a Venus or his sweetheart; so Ariosto utilized tradition, legend, imagination, in his poem; eager for beauty, and indifferent to the moral content.

'Orlando Furioso' opens with the Saracens in France; they have defeated Charlemagne and are besieging Paris. The episode of this war, ending in the victory of the Christian Emperor, and the flight of Agramonte and his death in combat with Orlando, is the plot which binds together the many stories and endless episodes. The story of Prince Ruggiero the Saracen, and his marriage after conversion, to Bradamante the Christian heroine, is a glorification of the House of Este, issue of this marriage. The episode of the fair and frigid Angelica rescued from the sea monster is very popular. Crowds of personages swarm in this poem, so full of imagination and actuality. Some of Ariosto's heroines are veritable amazons testifying to their love by feats of warlike valor, and contrasting with other heroines, full of sweetly touching timidity. Ariosto's style and versification are faultless. To have written with such perfect cadence and just management of measure, it is said he must have thought in *ottave.*

No history of *Cinquecento* literature should omit the shadow typified by Pietro Aretino (1492-1556), the cynic pamphleteer, whose impudence in selling his defamatory verse, or his

silence, is equalled by the immorality of the Popes and princes who bought and flattered him. Machiavelli the philosopher has an ideal of virtue; Ariosto the poet has an ennobling vision of beauty; even time-serving Guicciardini lives an unblemished life and believes that virtue is a good policy; but defamatory Aretino, son of a courtesan, bullies and blackmails; like a ravenous wolf he seizes his prey with violence and impudence. He wears his pen like a dagger, ostentatiously; he wields it like a coward. He surpasses the villain in the villainy of his libels, and is chief among braggarts. Yet, if we are content to take his viewpoint, his picture of his times and contemporaries is true. In this consists its value in a history of Italian literature.

LYRICS, TRAGEDY, COMEDY, IMPROMPTU, FARCE.

This *Cinquecento*, so intellectual and learned, gay and witty, betrays its emptiness in a flood of insipid lyrics, produced in imitation of Petrarch and Sannazzaro. Brightest exception is Michelangelo, who whether voicing his wrath at political corruptions or singing his passionate friendship for the widow Princess Vittoria Colonna, has always strength and nobility of utterance. That same Vittoria Colonna herself wrote praiseworthy sonnets, full of feeling. Tragedy went limping in a moral atmosphere that neither inspired nor could appreciate tragic feeling. The 'Panfila' of Pistoia is a clumsy adaptation of Seneca, and is typical. Giraldi's (1504-1573) 'Orbecche' is more original and shows good intention. Aretino's 'Orazia' lacks genuine merit and would have passed without honor in a less barren moment.

There arrives in the development of every race, as well as of every individual, a certain period characterized by great curiosity to behold itself as in a mirror; an inordinate desire for self-knowledge. The *Cinquecento* led the Italian people up to that stage of self-consciousness, hence the popularity of comedy, a form of composition that vividly pictures society, and presents its manners and spirit in the idiomatic language of familiar conversation. Lewdness characterizes all these plays, because cynical and unconcealed debauch was characteristic of the age. In the palaces of princes, in the halls of Academies, in the *Parlatorio* of every worldly convent, the occasional stage was prepared; and famous artists assisted in the creation of gorgeous scenes and costumes; while the common people delighted in the popular dialogues (*gliommeri*), of the Jugglers. Out of this varied material finally evolved two sorts of composition, each having its own audience. If the dulled palate of the intellectual *blasé* in princely halls preferred the idyls of the Pastoral drama, the larger audiences of the common people delighted in the rude wit and impromptu dialogues of the 'Commedia a Soggetto,' spoken in the local dialect. Satire is also a mirror in which the complacent society of *Cinquecento* delighted to observe its own reflection. Francesco Berni (1497-1535) held up just the reflection to please his contemporaries. The correctness of his style, the elegance of his verse, made the dainty frame. Berni wrote for the enlightened *bourgeoisie* of whom he was a part. In that style known from him as *Bernesca*, a parody of Petrarchism, a mixture of classicism, mannerism and realism; apparently rude, really fine art. In his *Capitoli* sonnets he laughs at the rudeness or obscenity he records, and without bitterness satirizes the immorality of all churchmen, from Pope Clement to the poor parish priest; the comfortless hospitality of whose parish house is wittily described in 'Fracastoro.'

The prose writings of *Cinquecento* may be briefly summarized in the unassuming composition of story tellers, biographers and essayists. Giorgio Vasari's (1511-1574) 'Lives of Painters' is a storehouse of information from which even modern critics are obliged to borrow. Benvennto Cellini (1500-1571) in his 'Life,' even better illuminates the varied aspects of an artistic career, and the strange relation between *Cinquecento* patrons and their *protégés*, Cellini wields his pen as he wields his chisel, masterfully. In both cases his figures stand in relief. He professes and lives up to the moral standard of his time. His imprisonment is a misadventure which broods no introspection and arouses almost no protest. Cellini's prose style is free, flowing, terse and picturesque, equally removed from vulgarity and pedantry. Baldesan Castiglione (1475-1529) in his 'Cortigiano' with classical elegance discourses of good manners. So does Giovanni della Casa (1503-1556) in 'Il Galateo.' 'Il Cortigiano' is the paragon of courtiers; 'Il Galateo' is the hand-book of every polite person, and has been republished many times. The *Novelle*, or stories, amply illustrate the infinite variety between different regions of Italy, they abound in local color and allusion, and diversely mirror the different localities. Lasca, bright, witty, and plebeian, correctly displays the character, life, instincts and ideas of the Florentine citizen. Bandello, once a friar, then a bishop, pompous, courtly and refined, in his 200 stories reproduces in another series of pictures the customs and life of his times.

The second half of the 16th century witnessed a great change in this bright Italian world. The long gathering darkness settled in the double pall of Spanish servitude and Catholic obscurantism. The Italian intelligence has always been either Roman Catholic or rationalist. Some, like Machiavelli, have considered religion as a question politic or artistic, neither to be discussed nor denied; others, like Savonarola, have demanded a reform of clergy but not of dogma. But while other countries were shaken by religious storms and persecutions, in Italy there was no strife and consequently no victory. The heavy hand of the victorious papal power was accepted indifferently. The Council of Trent (1545-1563) enforced discipline, which was resumed in the axiom *Si non caste tamen caute*, and encouraged hypocrisy. The institution of the «Index» comforted timid souls, scandalized by the current freedom of thought and license of expression. The Cardinals in Council could neither create a religious spirit in Italy nor seriously reform the clergy; but they did try and partially succeeded in creating the appearance of this double reform. In the country where

Savonarola had been an anachronism, and where Socinius found neither disciples nor opponents, there could be no real revival of faith; but society asserted the appearance of decency; and literature, assuming the forms of religion, without altering the paganism of its informing spirit, declined into the vacuity and affectation, hypocrisy, pedantism, and mannerism, which culminated in *secentismo*.

Yet two genuine poets and one immortal masterpiece brighten the gloom of the closing *Cinquecento*. Guarini's 'Pastor Fido' and Tasso's 'Aminta' mark the momentous parting between classical *Cinquecento* and rococo *Seicento*, and they gleam with the beauties of both. This is a new and delicate art. Sensualism is veiled in sweet melancholy, a melancholy as indefinite as it is alluring; a modern expression and delicacy of images.

There have been privileged poets whose souls have vibrated in unison with an environment, which they have identified and represented in the serenity of mutual comprehension. There are others, the martyr poets, who have been doomed to live in times and places in bitter contradiction with their own nature: of these, the most unhappy is Torquato Tasso. Both the exterior and the spiritual conditions of his life were intolerably miserable. As a man—whether as courtier or as lover, as a spiritual being—both as Christian and as poet, there was eternal warfare between his character, his circumstances and his environment. There was ample cause for his insanity and for his subsequent pitiful death. Tasso's heart, full of tenderness and sentiment, craved love in the loveless circle of court life; Tasso's soul craved the comfort of Faith and of a spiritual religion; and the Church gave him sophism and formalism. He was a feather, beaten and tossed upon a stormy sea. When at last after pitiful misfortune, imprudence and illness, he is visited by a gleam of glory, cheered by a ray of hope, then he dies: he dies, and the bells of the Capital peal for his incoronation: the laurel crowning of the author of 'Gerusalemme Liberata.'

Tasso's great poem glorifies the second Crusade, the battles between the Christian army under Godfrey of Bouillon and the Infidel under Aladin. The love of Tancredi for Erminia, of Olindo for Sofronia, the enchantments of Armida's garden; how eagerly have they been read, how freely imitated! The weakness and yet the charm of 'Gerusalemme' is that this poem, having the heroic or epic form, is lyric and sentimental in inspiration. Modernity characterizes Tasso's poem; a sympathizing introspection. It thrills in the immortal smile of Armida's eyes, it is beautifully analyzed in that scene of beauty, the death of Clorinda. 'Gerusalemme' was the last glory of *Cinquecento* before the gloom of *Seicento*.

IL SEICENTO.—17TH CENTURY.—DECADENCE.

In his 'Promisi Sposi' Manzoni has vividly portrayed that wretched contrast in Italian seventeenth century life between the actual poverty and weakness, and the inflated magnificence and insincerity which in art produced *barrocchism*, and in literature produced *marinism*. What the over-ornamented statues of Bernini, or the *façade* of San Mosé in Venice are in sculpture, the poetry of Marino is in poetry. Productions vacuous in conception, lavish in embellishment. But life is more than poetry and the plastic arts, and these do not completely represent the evolution of the Italian people. Though the *Seicento* is the most barren in the history of Italian literature, it is also the century of such solitary souls as Giordano Bruno, Tommaso Campanella, and Galileo Galilei, and Paolo Sarpi; a period of travail from which was born the modern spirit and the beginnings of a new era in Science and Letters and experimental philosophy; the more beautifully bright when contrasted with the surrounding meanness and spiritual poverty.

Secentism in Italy, *euphuism* in England, *le style précieux* in France, *gongorism* in Spain are all equivalent phenomena. The mannerism of this period can be traced back even to Petrarch, and is seen in Tasso, but it only became overwhelming under the double pall of Spanish and Papal oppression that now weighed upon Italy. It was not the special fault of any individual poet or prose writer, though some were greater sinners than others; it was the characteristic of the century, this moral inertness, this soul vacuity, this pretension, this imbecility, virtuosity and affectation of glitter that was not gold, nor even pure brass. Love, that informing spirit of all lyric poetry, which had been allegorical and mystic in the Middle Ages, æsthetic and sensual in the Renaissance, now became a mere rhetorical artifice, a *leit motiv* for infinite melodious and fantastic variations and multitudinous images, and minced and prated in sensual trifles. In the pages of the crowds of epic poetasters striving for immortality along the path of Tasso and Ariosto, the word «heroism» echoed as sounding brass and tinkling cymbals. The more religion, morality and patriotism—those great lights of inspiration—grew dim in the souls of men, the more did the marshlight of imitation elaborate with emptiness the pages of these versifiers.

Yet never had the forms of composition been more elaborate and finished; all the spoils of the past, all the treasures of classicism and Renaissance, were at the command of these witty, refined, but sceptic, wearied and unspiritual poets; incapable of either Pagan or Christian ideals. Giambattista Marini (1569-1625) is the epitome of *Secentism*. What Bernini is to Michelangelo, Marini is to Tasso and Petrarch. The same fatuity which multiplies the flowing draperies around the sculptured figures of the one, fills the poems of the other with strained images, extravagantly expressed. Marini, with his ample imagination, familiarity with classic models, facile devices of lewdness, grossness of detail, excessive ornamentation, extravagant metaphors; remains a curious document of the degree of aberration into which a civilized society can fall at some turning point in its evolution, when the intellectual lights of the past have grown dim and the beacon fires of the new age are not yet perceived. *Toute société a la poésie qu'elle mérite*, and Marini's 'Adone' was as low as the society for which it was written. Even the pulpit caught the infection

and the cheap rhetorical *falbalas* of Padre Segneri were greatly admired. At least these writers and orators gave to their most meaningless sentences the charm of melody, they possessed the gift of style.

Alessandro Tassoni was a man discontented with his own lot and who perceived the emptiness of the world about him. Witty, pungent, impudent; his invectives, libels and satires struck everything he disliked, especially the Spanish oppressors of Italy and the sometimes subservient Savoian Princes. His 'La Secchia Rapita' was the sort of ridicule which could prove effective, but his critical essays 'Pensieri' have slight literary value.

Francesco Bracciolini's 'Scherno degli Dei' is a parody of mythological legends, and Lorenzo Lippi's 'Malmantile' is still a mine for students of old Tuscan customs, proverbs, traditions and popular sayings. In Florence, Francesco Redi (1626-1698) unearthed the antique dithyramb. His 'Bacco in Toscana' is still quoted. If Vincenzo da Filicaia's 'Canzoni' are forgotten, his sonnet 'Italia Italia o tu cui fea la sorte' is remembered for its genuine patriotism.

On 5 Oct. 1690, in San Pietro a Montorio was held the first meeting of the *Academia della Arcadia*. The patron saints were Theocritus, Virgil, and Sannazzaro, the protecting deity *Gesu Bambino* (the Child Jesus) as a symbol of purity; the emblems were a rustic *zampogna* wreathed with laurel, the constitution a mixture of archaism and affectation, the aim a return to Arcadian simplicity, the means an artificial refinement of both manners and language. 'Arcadia' has had many literary sins laid to its charge, and justly; nothing could be worse than its axiom that nobility of literary composition was to be obtained through imitation; but the follies, puerilities, affectations and dilettantism of Arcadia was a symptom rather than the cause of the current literary corruption. Giambattista, Zappi, Eustachio Manfredi, and Paolo Rolli are among the less forgotten poets of 'Arcadia' and Carlo Innoceuzo Frugoni (1692-1768) the last and most extravagant.

Seicento produced no Italian tragedy worthy of consideration, though the attempts were numberless; usually imitations from the Spanish drama, or founded on some episode of the *Gerusalemme* or the *Orlando*. Giambattista Andreini's 'Adamo' provided some scenes for Milton's 'Paradise Lost.' So, too, the literary comedy chiefly consisted of imitation or translation of Plautus and Terence. Popular comedy (the *Commedia dell' Arte*) extended its success even to the Court of France, though of the *Arlecchino, Truffaldino, Brighella* and the extravagant enthusiasm for the charming *Isabella* and *Columbina*, there has nothing come down to us but *scenario*, the plot; stripped of the witty impromptu and brilliant dialogue. Initiated by Poliziano's 'Orfeo' Italian opera was gradually taking form. In 1600 Rinuccini's 'Euridice' set to the music of Peri was received with favor, and was succeeded by Chiabrera's 'Rapimento de Cefalo' with Monteverdi's music.

Justice to this much despised 17th century demands that credit be given to the vigorous writing of the martyr philosopher, Giordano Bruno. A spirit preoccupied by such lofty thoughts could only be eloquent and forceful. The candle he lighted at the stake has continued through the centuries to illumine the lamps of the heirs to his ideals. Tommaso Campanella, another victim of religious obscurantism, paid with twenty-six years of prison and seven applications of torture, for his faith in man's perfectibility through science and the help of wise government, as set forth in his Utopian dream, 'La Città del Sole': Galileo Galilei (1564-1642), whose wonderful discoveries and miserable fate are familiar, in his famous 'Dialogues' is a master of prose composition. Fra Paolo Sarpi (1552-1623), the champion of Venice and antagonist of Papal supremacy, in his 'History of the Council of Trent' presents a remarkable example of well-balanced historical information in pure and noble language.

IL SETTENCENTO—XVIII CENTURY. ARCADIA—RINNOVAMENTO.

Mannerism, affectation, and pretension characterized seventeenth century Italian literature; the emptiness of the early years of the following century was not less depressing. The Academy of Arcadia loudly proclaimed a return to pastoral simplicity, a reform of manners and literary taste, and a refinement of language. *Jesu Bambino* was the patron, and the Pandean pipe the emblem of the puerile association. Among the few silly sheep who have escaped oblivion are Vincenzo Gravina, Paolo Rolli, and Carlo Frugoni. There were, however, a few prose writers worthy to be precursors of the *Rinnovamento*. Ludovico Muratori (1672-1750), in 'Annali d' Italia,' recalls his degenerate countrymen to patriotic ideals, Girolamo Tiraboschi wrote the first complete manual of Italian literature, and the philosopher Giambattista Vico (1668-1744), seems to have had prescience of much that has lately been proved by experimental science.

After the Peace of Aix-la-Chapelle (1748), and the return of the Italian Princes to their thrones, ensued an era of social reform and intellectual activity. The influence of French philosophers, especially the scepticism and humanitarianism of the *Enciclopédie* spread rapidly; in Milan, in the hospitable *Casa Verri*, a group of young and eager intellectuals inaugurated *Il Caffè*, a periodical which from 1764-1766 exercised real literary influence, and Cesare Beccaria wrote his great treatise on 'Crime and Punishment,'—*Dei Delitti e delle Pene*. Galiani, Algarotti, Baretti, and Gozzi were worthy critics; on the subject of «purism» literary controversy was vehement. The conservative *Accademia della Crusca* opposed the admission of neologisms and foreign words to the language, and proscribed popular phrases; while the revolutionary *Caffè* insisted upon enriching the classical idiom by free foreign borrowings. Melchiorre Cesarotti (1730-1808), in his 'Saggio sulla Filosofia delle Lingue' dictated the theory of this rebellion against linguistic tradition.

Metastasio, Goldoni, Parini, Alfieri, are the great writers of the Italian *settecento*. Pietro

Trapassi, known under the hellenized name of Metastasio (1698-1782), was a facile versifier, and understood the human heart. His tragedies are still admired, and his mannerisms and stage arrangements so universally copied, that with slight alteration of names and appearances, his heroes and heroines still strut the stages of Europe. Carlo Goldoni (1707-1795), in his 250 plays accomplished for Comedy what Metastasio did for Melodrama. His faithful presentations of life are seasoned with smiling humor and indulgence, and make no attempt at philosophic generalization, pathos, or passion, while he represents his corrupt age with a delicacy that is not hypocrisy. He preserves the familiar figures of *Arlecchino, Brighella, Colombina* and the other *maschere,* but gives them new characteristics, and observing the classic unities his plays move rapidly, with few episodes or secondary characters. *Bottega del Caffè Rusteghi. Pantalon de Bisognosi* and *Tita Nane* treat every rank of life with equal indulgence, and their serenity, gaiety and winged epigrams still amuse Italian audiences. In the second half of the 18th century the poet Giuseppe Parini (1729-1799), preached the new gospel of humanity. In Parini's chief poem, 'Il Giorno,' he satirizes the empty life of a fashionable dandy, whose morning occupation is the toilet; the second part, including the *Giovin Signore's* attendance on his fashionable mistress «*La pudica d' altrui sposa a te cara,*» enlarges the scene.

Alfieri (1749-1803) and the Tragedy.—When Alfieri read 'Plutarch's Lives,' and contrasted that early heroism with the pusillanimity of his own Italy, he shed bitter tears; and resolved to rouse his countrymen to a love of liberty and hatred of tyrants. He chose the theatre platform in order to reach the largest audience. Discarding all secondary personages, all episodical ornament, he surpasses his model, Corneille, in the simplicity of his composition; the dialogue is abrupt, long speeches being reserved for declamation against tyrants and grandiloquent expressions of patriotism. Alfieri's tragedies all consist of contrasts between heroes and tyrants, as Don Carlos against Philip, David against Saul. This eloquent appeal came at the crucial moment, the closing years of the 18th century; it sounded as a resurrection trumpet to the Italian Nation, and the dead became alive. Alfieri's writings possess literary qualities, but they are chiefly important for their patriotic purpose and political effect.

OTTOCENTO—XIX CENTURY.

CLASSIC,—ROMANTIC,—MODERN.

The revival of Italian letters was closely associated with those political events of the 19th century which changed a mere *expression géographic* into a great and independent Nation. Never in the world's history has the reciprocal influence of literature and political events been greater than during the Italian *Rissorgimento.* This literature was both child and parent of the Italian cry for freedom, both product and inspiration of the national revolt: the three periods of national evolution correspond with three phases of literary development. A first period of «classicism» answered to the Napoleonic shadows of glory and dreams of universal Empire (1800-1820); following close on the disappointment of the Congress of Vienna and the restoration of the Austrian Princes to their Italian thrones, the aroused spirit of rebellion assumed the literary form of «romanticism» (1820-1859). When the union of Italy was accomplished and reality failed to fulfill the promises of phantasy, came a third period, one of disillusion and depression, of which the literary expression was «realism;» followed finally by the *Terza Italia* in which republicans and neoguelphs became reconciled to the monarchy, and literature found its present natural and national channel. Classic with Carducci, æsthetic with D'Annunzio, religiously mystic with Fogazzaro; with as many divergent tendencies as there are masterful writers to indicate new ideals, Italian literature has become an Art; worthy of the present, promising for the future.

Vincenzo Monti (1754-1828)—represents the conflicting tendencies of the first period. 'La Bassvilliana,' written in 1793, echoes the general reprobation of republican violence; 'Ritorno d' Astrea' welcomes even an inglorious peace after the horror of war. Monti gathered honey and perfume from every flower; Shakespeare, Alfieri, and the Greeks, suggest the heroic note in his tragedies 'Aristodemo' and 'Caio Gracco;' his 'Bardo della Selva Nera' is imitated from Gray's 'Bard' and Klopstock's 'Messiad' furnished material for 'Bassvilliana.' But Monti's assimilation and sensibility save his imitations from servility.

Foscolo, Niccolini, Manzoni sang the name of Italy. Their alarum rang out in the silence of a Nation's night, they appealed to abstract ideals and aroused some emotion, but Ugo Foscolo's novel 'Ultime Lettere di Jacopo Ortis,' awakened the Nation. Foscolo's nature was of pure Greek classicism, yet when in this novel he attempted to imitate Goethe's 'Werther,' his production thrills with a romantic passion for liberty. Though classic eloquence inspires the speeches of Jacopo Ortis, the approaching wave of «romanticism» is felt in the sentimental story of the lovers. It was the beginning of the duel between «classicism» and «romanticism,» which was continued at Milan between the reviews *La Biblioteca Italiana* and *Il Conciliatore;* the former being paid and controlled by the Austrians to reconcile Italians to their bondage, pretended to defend classicism and the purity of the Italian language; while in the opposing review *Il Conciliatore,* Pellico, Gioia, Romagnosi, Melchiorre and other liberal writers strove to rouse their countrymen to a knowledge of foreign thought and literature. Their battlecry was «romanticism», because romanticism meant rebellion against every literary, religious, or political yoke; and opposition to classicism, and everything else favored by the Austrian oppressor.

In the midst of this turmoil loomed Giacomo Leopardi (1798-1837). With craving for beauty, love and glory, with seething mentality, soaring imagination; this solitary soul, without faith or the consolations of religion, beats and breaks his wings on the iron bars of his spiritual prison-house. One by one all ideals, all aspirations drop from him; virtue, love, patriotism, crumble; a poet's heart is desolate, empty, despairing;

each new pang, each bitter disillusion evokes a poem. 'Le Ricordanze' is the mournful story of love unattainable, 'Consalvo' and 'L'Ultimo Canto di Saffo' voice the deepest agony; welcome death is the only refuge from the torments of cruel love. Leopardi does not reproach God, he ignores Him. Brute Nature, *Il brutto Poter che a commun danno impera,* is the enemy. In 'La Ginestra' nature is a perverse will planning the misery of men; 'Canto del Pastore Errante' reveals a darker despair, a deeper penetration of the mystery than does even De Vigny's 'Maison du Berger.' Leopardi's suffering differs from the sentimental romanticism of Manfred, Werther, or René; he is essentially classical, his vision of beauty has the simple outline, the grace, of Greek statues. What antique elegance and serenity are in 'La Quiete dopo la tempesto,' 'Il Sabato nel Villaggio.' Because of this truly Italian classicism and introspection Leopardi's fame survives as the founder of the school made illustrious by Carducci.

Alessandro Manzoni (1785-1873) wrote two tragedies, 'Carmagnola' and 'Adelchi,' admired for their resounding verse; and his 'Inni Sacri' are true hymns of Christian faith; but Manzoni's fame is founded on his novel 'I Promessi Sposi' ('The Betrothed'), which is the only great novel of the Italian romantic school. 'I Promessi Sposi' is a faithful mirror of the moment, though modern Italians dislike to admit that the passive endurance of oppression there described truly represents the national spirit of that period. It is a simple story of love, with homely figures and characteristic types, round which is constructed a large and life-like historic picture. Once every novelist was a Manzonian. Grossi accepted the master's guidance, D'Azeglio his advice. Romagnòsi, the deepest sociologist of his time, and Rosmini the opponent of Jesuitism, and many poets, novelists, and philosophers formed the Milanese literary group of which Manzosi was the centre.

Manzoni and Ippolito Nievo will always be contrasted, as will 'I Promessi Sposi,' and 'Le Canfessioni d'un Ottuagenario' ('The Memoirs of a Man of Eighty'). These novels are the beginning and end of the romantic period. Manzoni lived to see his romance an abounding success, Nievo died before his was published. The very name Ippolito Nievo is an evocation of the romantic, rebellious, heroic Italy of which he writes. Like a hero of some legend, Nievo uttered a cry, wielded a sword, loved and was loved, and then in words vibrating with passion, pathos and sincerity, he created a marvelous picture of his period, a wonderful presentation of the double evolution of himself and of his Italy. Nievo's life, his novel, his country, each explains the other.

The romantic tragedy was attempted by Giovan Battista Niccolini. His 'Arnaldo da Brescia' is an epic of symbols ringing with war trumpets, rather than a play. Italy is here represented by Arnaldo, the Papal power by Pope Adrian, and Imperial tyranny by Federigo III. Patriotism also inspires the poetry of Berchet, Giusti, Carlo Porta and Poerio. Gioacchino Belli (1791-1863) is a master of humorous and patriotic poetry; his sonnets sound the inextinguishable laughter of the Roman people; the tavern and street corner, the priest and Pope, the mendicant and parasite all pass by, as he unrolls his panorama; it is Life,—Roman life. The poetry of Giovanni Prati and Aleardo Aleardi fanned a flickering flame into the dying embers of romanticism, Giacomo Zanella was applauded for his short poem 'Sopra una conchiglia fossile;' but soon these pale stars were extinguished by the rising sun of Carducci's classic splendor; and romanticism fled from Italian literature when Nationalism, the patriotic purpose which inspired it, was attained. Though true as representing a psychic moment, «romanticism» was false as a representation of Italian temperament.

Third Period.—After the occupation of Rome as the capital of Italy (1870)—fulfillment of hope long deferred,—Italians faced many discouraging political, social, and financial problems incident to the amalgamation of many petty states unto one united kingdom. Literature reflected this moment of peculiar perplexity. In Giosuè Carducci *Terza Italia* found its voice; his soul was the soul of the people, his genius the genius of his race; the classicism, earnestness, patriotism of his poetry, are those of the complete and complex *Italiano;* 'Juvenilia' is purely classic, 'Levia Grava' is not free from foreign reminiscence, in 'Decennalia' and 'Giambi ed Epodi' are the impulses of Juvenal, the grandiloquence of Hugo; 'Rime Nuove' is the greatest poetry of modern Italy, and is composed in every variety of metre; 'Odi Barbare,' so-called because they lack the *arsi e tesi* of the Latin, are classic reconstructions; 'Ça ira' is an approach to a modern epic. Always Carducci adores Italy; his landscape, his characters, are purely Italian. What beauty in *Maria Bionda* whose smile is like the sunbeam of *April novo* on fields pied with flowers! How far from «Arcadian» mannerism and frisky lambs, is the life of the Maremma (*Idilio Maremmano*) plentiful in primeval plowing, with young men lustful and brave, vaulting on wild horses!

While poetry flamed prose literature plodded. Paolo Ferrari and Achille Torelli wrote popular plays and Giuseppe Giacosa held the boards for 30 years. His plays 'La Partita a scacchi' and 'Il Conte Rosso' pleased Italian audiences and 'Come le foglie' and 'Il Piu Forte' display feeling, and perception of the Italian problem of a sceptic Nation with an ancient civilization and an outworn faith, facing modern civilization. Pasquale Villari's authoritative histories, 'La Storia di Girolamo Savonarola e dei suoi tempi,' 'Niccolò Michiavelle,' and 'I primi due secoli della Storia di Firenze,' are not less known through English translation than in Italian; they are a part of the best Italian literature of the century.

The Novel.—The last Manzonians and some pedestrian imitators of the French were issuing a few scarcely read novels when the dispute about 'realism' aroused attention and stimulated writers. Zola's claim of having lighted a new lamp was not questioned; yet Italian literature in every age has shown a direct observation of life. What more realistic than some passages in Dante, Boccaccio and Ariosto? Except for the first few imitations from the French, Italian realism,—or «naturalism,» as they call it, de-

veloped in a purely Italian manner. Individualism is the keynote of the Italian character, and is reflected in that mirror of society, fiction. Love, to the Italian, is the effect of physical sensation, though this often afterwards develops into a sentiment. In Rovetta's novel 'Mater Dolorosa,' Lalla loves her husband yet accepts a lover; Serao's *Ballerina* is the slave of desire for a man who has never mentioned love to her; Neera's maidens are all swayed by physical sensation; Fogazzaro's 'Daniele Cortis' is almost the only successful Italian novel in which love is conquered by duty.

Giovanni Verga and Luigi Capuana were the first champions of the realistic Italian novel. Verga's representations of simple semi-civilized Sicily are truly Italian. De Roberto, a follower of Verga, has traced an historic picture of Sicilian life. Matilde Serao, after attempting the sentimental novel and the Zolian methods of observation, has successfully blended these two fictional elements in 'Suor Giovanna della Croce.' Enrico Butti has given remarkable studies of the modern conscience. Antonio Fogazzaro's novels are an honor to Italy, they unite realistic observation and spiritual insight. Gerolamo Rovetta faithfully represents a society lacking in noble ideals; his characters are as often sordid as wicked. Salvatore Farina is optimistic, Grazia Deledda feelingly describes her own Sardinia, and De Amicis presents familiar scenes of soldier life and street car episodes.

In the beginning of the 20th century Gabriele D'Aunnuzio occupies the first position among Italian writers. He is the most widely read and the most imitated, and he has made incursions into almost every form of literary composition. In his lyric poetry bright images and harmonious rhythm partly conceal the coldness; adopting Greek elements in his tragedies, a vague theory of heredity replaces classic fatality, and the undaunted will is substituted for heroic virtue. But D'Aunnuzio the complex, refined, egoist and sceptic, cannot grasp the grandiose simplicity of antiquity, — the transcendental self-abnegation which is the finality of tragic art. The pathos of *Mila di Codrio*, the sentiment of *Francesca*, even the devotion of *Maria Vesta* are tainted with artificiality.

The immorality and cruel individualism of D'Aunnuzio are less repugnant when read in his novels than when spoken in his plays. 'Piacere' is a prose poem to the goddess Aphrodite. 'Il Trionfo della Mortè' is D'Aunnuzio's greatest novel. What reintegration of life in symbols, what evocations of beauty! Yet what emptiness! What half-truths. Half-truths presented with beauty, harmony and *volupté* in gorgeous golden pictures. 'Le Vergini delle Rocce' is dream-stuff, impersonations of virtues; the castle, the landscape, the glory of spring-blossoming, the symphony of water, the grandeur of majestic hills, the splendor of sunsets! It is a new species of literary composition. 'Fuoco' is also a dream of beauty. Venice, has never been sung with more complete comprehension of her seduction. D'Aunnuzio is the apostle of the pagan interpretation of life and beauty. He satisfies the Italian craving for elegance of style and purity of language. But he gives a false impression of life; he generalizes from accidentals; though he is keenly alive to the lesser sensations he is ignorant of the majesty of the human soul, and his glittering phrases contain no solution of life's great problems.

Satisfactory criticism by the Anglo-Saxon of Italian literature is difficult, the view-points, both moral and æsthetic, are so different. In the Italian psychology there is much latent paganism, this is evidenced in the persistence of classicism in literature; it accounts for the popularity of D'Aunnuzio. In Italy it is often asserted that the national literary development tends towards a return to *Cinquecento* ideals, the ideal of the artist careful only for the precepts of his own art. But since no nation does ever return to a previous state, and since those predominant factors of modern literature, the novel and the drama, must inevitably reflect the nation's life and be occupied with the themes which appeal to the national conscience, Italian literature will doubtless give increasing attention to social and economic conditions and the relations of the individual to society. Writers on these subjects will seek for a philosophy of life and emphasize rather the emotion of ideas than the emotion of sentiment. For others, like Fogazzaro, the soul of man will be the arena of supreme strife, and the law of the soul, the relentless despotism of conscience, the subject of supreme interest; while still others, of D'Aunnuzio's school, will insist on the «humanist» ideal of «Art for Art's sake,» and find in Joy, Art and Beauty, the «fullness of life,» and the subjects for literature.

22. **Italy—Art in Ancient Italy.** Italy's geographical situation, extending from north to south and reaching far into the Mediterranean Sea, nearly midway between its eastern and western extremities; open on all sides to the migrations of peoples and the activities of commerce, has from the earliest times been influenced by the civilizations of the various nations, «The Peoples of the Sea,» Phœnicians, Egyptians, Etruscans, Greeks, the inhabitants of the Balkan Peninsula, and all dwellers on the shores of that great inland sea, and even the teeming life of the Orient. Indeed it was the movement of this Oriental civilization westward which retarded the progress of Italy in Art as compared with Greece. Nevertheless some of the primitive Italian peoples developed peculiar artistic manifestations worthy of consideration.

There was no true art in the paleolithic age, although some primitive Italian manufactures reveal a certain æsthetic sentiment for form and considerable skill in the making. Liguria, the Valley of the Vibrata and the Island of Capri, are the chief Italian districts where are found relics of human industry of the paleolithic age, but these scanty remains do not permit of the minute classification which is possible for the same periods in France.

The neolithic period was more productive. Its remains are similar almost everywhere in Italy and in its objective manifestations it does not differ from the *facies* which this period of civilization presents in the rest of Europe. In architecture we have not immense megalithic constructions as in England and France; perhaps because the civilization of the neolithic age was not prevalent in Italy at the time in which these megalithic constructions were in vogue. Notwithstanding this, there are Dolmens in the province of Otranto; the caves of Liguria are full of neolithic remains and the islands preserved for a long period the remains of the population and of the civilization of the neolithic period, and especially of the latter phases of that civilization what is called cupro- or æneolithic.

Throughout Italy may be found weapons of elegant form, both in stone and in copper. Ceramics attained to artistic forms more than any other manufacture, as in the bell-shaped cups and bowls decorated with ornaments crudely cut with a knife, or stamped with wormlike designs, and then filled with a coloring matter; the decorative element is always geometrical. The most beautiful works in neolithic ceramics are found among the insular populations, the Sicilians and the Sardinians, who had for a longer time tried to develop their civilization. And, thus, even architecture made noteworthy advances in this period, perhaps through the influence of the Orient. We do not know if the dwellings of the living had already assumed artistic forms; although the ceilings of the dwellings in the neolithic and æneolithic ages indicate great progress in roof construction; they were circular or oval and partly sunk and covered with a kind of cupola. The artificial crematory vaults of Sicily are complicated systems of tombs, which may be compared with the oriental tholoi; the nuraghi, the domus de gianas, etc., of Sardinia, similar to the megalithic construction of the Balearic Isles, or of Malta, and of Pantelleria, are an ulterior and characteristic development of the monuments of neolithic civilization; there is an oriental suggestion in the cupolas, the rare spiral decorations, and in some exceptional instances of fortified walls, or of encorbellement.

In Sicily (probably owing to Aegeo-oriental influences), the development of a ceramic art is to be noted which in the subsequent period substituted painting in place of incized decoration, with the richness of polychrome ornaments.

In regard to architecture the new people of roving habits, accustomed to living in marshy plains, or on the lakes, brought with them a knowledge of building which was better adapted for buildings of wood than of stone. The palisades and the «terremare» of Lombardy, which are but the continuation of these, are constructed on strict principles of exactitude, defence and permanence, which we find later in the Etruscan cities (for instance Marzabotto); or in the intrenched Roman camps. Indeed, it is even a matter of doubt with some whether the architectural portions of the *terremare* should be attributed to these primitive people at all, and not rather to the subsequent Roman buildings. The fact is that the rude manner of life and the low development of the arts, do not well accord with such a perfect system of land surveying. The ceramics of these people are of coarse and imperfect paste, of a dark color, for the most part not well moulded, scantily decorated, generally with protuberances or applied ornaments, more rarely with engraven or stamped designs.

The bronzes, on the other hand, show more advanced artistic forms; daggers, lances, arrows, and personal ornaments in molten bronze, among which at length appears the fibula, while there may still be found ornaments of bone, ivory, amber, and other natural substances (shells, teeth), or artificial substances, imported glass compositions, etc.

Whilst in the Aegean archipelago and in Greece the civilization called Mycenean flourished, in the third and second thousand years before Christ, there was in the Mediterranean basin a continual coming and going and mingling of people, in active commerce. During this period must have been formed the principal nuclei of Italian populations that figured in the dawn of history. A great part of Northern and Central Italy was occupied by the Umbri: the East centre and the South by Osco-Sabine populations; in Liguria, in the islands and the extreme Southern portion there survived primitive stocks such as the Liguri, the Siculi, early Sicilians, and the Sardinian and the Messapii. In the upper eastern corner the Illyrian migrations continued which gave rise to the civilization of the Veneti; then in the central part on the Mediterranean, or Tyrrhenian, there arose the splendid power of the Etruscans; while, later, there descended from the Alps, the Celts and Greek colonies that invaded the South.

Each of these peoples for a time held a certain supremacy over considerable territory and represented a certain phase of Italian art and civilization. The most splendid and most characteristic phase of the iron age in upper Italy is that found in the Felsinean (or Bolognese) territory corresponding to that on the other side of the Alps called *Halstatt* civilization.

The incinerating tombs in the last period are ornamented with *stelai,* or narrow slender slabs of sculptured stone above the surface of the ground. The metallic ornaments and bronze weapons are partly of molten work, some filed, some in relief, and some carved and engraved.

The ornamental designs are evidently inspired by the geometric forms of contemporaneous Hellenic civilization. With the progress of Mycenean decoration we have the gyrate, the wolf's tooth and the double spiral.

The broadsword belts of laminated bronze are beautiful; the swords with hilt in form of antennæ; the poniards, etc.

Almost contemporaneous was the civilization of Venetia. The shapes of the vases are various; their characteristic decorations are first the bright stripes of red and black, then the impressions, then the incrustations of metal bosses. Great is the variety and richness of the pendants, tassels and amulets: sometimes fantastic animals double bodied, in evident geometric style. Later appear the laced garments, and the famous *situlæ,* finely worked in relief in long circles representing living scenes, festivals, hunting parties or simply animals running, as on the Corinthian vases.

In Central and Southern Italy, «Umbria», the people who dwelt there in the first iron age were represented in the industrial age by similar forms, which had no time to develop as did those of Bologna, because of the super-imposed Etruscan work. In the Adriatic watershed, the more ancient ethnical foundation prevailed, and the Illyrian influence made itself felt; in the Mediterranean watershed, before the Etruscan invasion, the civilization of the Oscoli, the Sabini, the Falisci, and the Latini was more simple. Thus are manifested the remains of the Albanian necropolis, of Campania and Tuscany, before the appearance of the Etruscans.

In the South of Italy, before the Greek colonizations, there was an extended Italian civilization; but it fused with Sicilian elements which always predominate. In the extreme Eastern limb, the Sallentine peninsula, we find among the Messapii survivals of a local civilization which developed under the Mycenean influence. Characteristic, for instance, is the ceramic art which lasted until a late epoch with forms of a *conca,* or water vessel, of *trozzelle* and with vivacious bright-colored painting, consisting of elements, in part geometric, in part flowers, and a phenomenon which goes *pari passu* with the advance in Sicilian ceramics in which exactly at this period polychrome art found its widest and most varied application.

Another element of Italian art which started in the South and extended to Central Italy is the civil and military architecture. In Lucania we find more rustic, and perhaps more ancient, instances of these constructions, called Cyclopean or Pelasgic, which are found in a more perfect, or earlier phase in Central Italy. Here are also found walls of support for terraces, such as the Cretan, streets sustained on sloping sides, bridges, *hierons,* altars, or central temples, etc.

Exhaustive researches are still necessary to finally settle the disputes as to the antiquity and origins of these constructions. There are three hypotheses: either they derive their origin from the megalithic constructions of the neolithic age, or are an importation of the Aegæo-Mycenean architecture; or are an imitation of the Hellenic fortifications of later times.

Central Italy was soon made to feel the influence of a people who, more than any others, inhabiting a beautiful country, were endowed with a love of life and the artistic spirit.

The Etruscans represent a problem in the history of ancient Italy, which the unwearying efforts of learned men of two centuries, and vast and profound excavations, have not yet been able to solve. It seems, however, as though the better theory considers the Etruscans a people differing from the other Italian races, as immigrants perhaps from Asia Minor. All students agree that the ancient inhabitants of Tuscany developed on Italian soil a peculiar form of civilization in which art had a great field of expansion and which exercised a powerful influence on the neighboring or subject peoples.

At the end of the 10th century B.C., or before that, we find in Etruria new forms in architecture; and in the industries, which are the most ancient arts.

Civil and military architecture in Etruria was displayed in the fortified cities, where they had not the structure and the archaic forms of the so-called Pelasgic cities, although the same roof construction prevailed. The most ancient instances are those of Rusellæ, Cosa and Fiesole; at Populonia we find the intermediate phase, and at Volterra and Cortona the more progressive form.

In architecture, and especially in sepulchral architecture, there are remarkable survivals of Mycenean architecture. The decorations of the gate of Felsina with two heraldic animals facing each other has a parallel in the Gate of Lions at Mycene, and true and regular *tholoi,* or circular buildings such as the sepulchral chambers of the Tumulus of Petriera near Vetulonia and the tomb of Cuma, recall as do none others the barbican vaults in the celebrated treasuries of Mycene. Still more characteristic bee-hive forms are seen from the ancient Tullianum in Rome, and ogival sections of the fountain at Tusculum are direct and indirect remembrances of the Mycenean roof structure. Later on, as in Greece, the sepulchral vault was more commonly in rectangular form with sloping roofs, copied from the houses, of which we have effigies on several urns and sarcophagi.

One of the merits of Etruscan architecture is, that it developed curved lines in roofs, following a principle of oriental architecture, that is to say, the invention of the arch and the dome formed by wedge-shaped pieces of the building material converging toward a common centre.

The most ancient examples, however, do not appear to go farther back than the 7th to the 6th century B.C., as for instance the so-called Tomb of Pythagoras near Cortona.

On these principles the Etruscans were able to build roads, bridges, subterranean tunnels for drainage or aqueducts, to build gates in their cities of enormous size, as, for instance, that of Volterra, or the later one of Perugia.

As regards the edifices we must suppose that the early wooden structures continued un-

til considerably later times and we see imitations of them also in stone, as in the section of a tomb of Carveto. Through their maritime commerce with the Orient and Greece the Etruscan architecture developed on Greco-Ionic models, of which the Tuscan style affords an example.

Recent discoveries prove that even in more modern buildings the foundations were constructed after the Mycenean pattern. The excavations at Marzabotto show the plan of the Etruscan cities. The city faces east and west, its two principal streets, the *Kardo* and *Decumanus,* dividing it into a cross; in the centre of the cross is the *Templum,* and the four principal gates are at the extremities of these two cross streets. The Etruscan temple was rectangular upon a high base, sometimes a simple cell with *pronaos* or portico in front of the cella, but more often with three alcoves for the three idols, Jove, Juno and Minerva.

The form of the Italic and Etruscan dwelling differs from the Greek dwelling, is oriental in its origin and was brought into Italy by the Etruscans. This is the origin of the Roman *domus,* though so modified that the primitive form is almost unrecognizable.

In Etruria, plaster was used chiefly for the ornamentation of edifices, especially of temples, in which terra-cotta ornamental designs in different colors were applied. But whether owing to the lack of a material suitable for sculpture, such as marble, whether through the practice gained in this decorative sculpture, coroplastic made great progress in Italy, as we see in the written traditions which celebrate, for instance, Damophilos and Gorgasos, the decorators of the temple of Ceres, and in the museums where it figures as the principal art of the Etruscans. Remarkable examples of the archaic period are the sarcophagi in the Louvre, the British Museum, and the Museum of the Villa Giulia in Rome, and the Ionic decoration discovered in recent times on the face of the temples of Luni, of Falerii, and of Arcevia.

Modelling gave the Etruscans special opportunity to practice the art of portraiture. Naturalism, sometimes carried to caricature, may be seen on some of the most ancient *busti,* on the cinerariums, called «Canopi,» as those of Chiusi. The Tyrrhenian sculptors knew how to accurately trace physiognomical traits; they were the true creators of the art of drawing from nature, which we find later in Roman art, and renewed again in the *Renaissance* in the works of Donatello, on Etruscan ground. The *Ius imaginum* in the noble families encouraged this characteristic side of Italian art, but the true incentive was in the peculiar disposition of the Etruscan stock.

Next to coroplastic, but more rare, is the sculpture in soft stone, clay, rotten stone, *nenfro,* and *peperino;* which acquired a more dignified aspect by means of plaster and colors. In time these materials were also substituted for wood in the construction of more important buildings.

Painting was also extensively used by the Etruscans. The immoderate luxury of their life and the special care devoted to the dwellings of the dead, caused them to place their tablets inside the tombs, concealed from public sight. From this it is argued that painting was also frequently used to decorate public and private buildings, of which no remains have been preserved.

The most ancient examples of mural painting are found in the tombs of Veii, depicting animals of oriental form, and in the slabs of Cære in the Louvre, with scenes relating to the religious ceremonials of the dead.

The richest and most varied sepulchral paintings of the beginning of the 6th century are found to-day in the necropolis of Corneto (Tarquinia), Orvieto (Volsinii), and Cervetri (Cære). The favorite subjects are those which, while representing material joys of life, as well as the basest and most cruel, seek to enliven the Elysium of the dead, perhaps with scenes of funeral ceremonials or historical events or the terrible scenes of Inferno, peopled with demons, evident prototypes of the Tuscan religious paintings of the Middle Ages. These paintings reveal the influence of Greek art, especially of Ionic art; the imported vessels (cups, bowls, etc.) served as an inspiration to the local artists, but the sentiment expressed in the subjects, full of mystery and ferocity, and the heavy and vulgar style of the faces are sufficient to reveal the different character of the Etruscans.

The Etrusci tried also to imitate the beautiful ceramics which were brought from the best Greek manufactories; but it is hard to say how far they succeeded. They rather became specialists in the manufacture of the *bucchero,* a dark pottery for funeral uses. Certain copies of metal house utensils derived from the Italic clay paste, but perfected on Græco-oriental models, soon became an Etruscan specialty, and in later times acquired the delicacy and lightness which is lacking in the more ancient type.

They were recognized as masters in the fusion of metal, even by the ancient Greeks. They executed a great number of works of industrial art, rising even to great sculptures, as in the Capitoline Wolf at Rome, the *Arringatore* of Florence, and other statues and statuettes scattered about in the different museums.

They were unsurpassed artists in the working of gold. It seems as though they had inherited from all the ancient people their special arts; from the Aegæans, filigree work and granulated work and glyptics; from the Egyptians and the Phœnicians, enamelling and glass compositions (pastes); from the Syrians and other Asiatics, moulding and carving; from the Ionians, the ornamental designing of fantastic flora and fauna, already reduced to decorative use; from the celebrated arts, the art of blending different woods, of soldering metals, of wood carving, and *ageminatura.*

From the most remote times we find in the Etruscan tombs ornaments of oriental character, finely worked in gold, electron, silver, etc., mostly fibulas, belt clasps, necklaces, etc., as at Vetulonia, Cære, Præneste, Cuma, about which there has been much discussion; some archæologists maintaining that they are of Græco-Ionian, or Phœnician manufacture; others, that they are of local art. This last opinion seems now to be the most trustworthy. Later we find, especially in Southern

Etruria, chests decorated with the finest engraving, an art which became localized through the Latini of Prænestе, a technical art which was greatly employed in the manufacture of mirrors, and succeeded in imitating the celebrated Phœnician drinking cups.

In all the industrial arts, the Etruscans excelled. The few remains we have of carved ivory show a perfect knowledge of intaglio. They were less happy in the manufacture of money, which they learned probably from the Greek colonies of Southern Italy.

Altogether, the Etruscans were a people eminently gifted with the artistic sense; they had the merit, through their conquests, by which they dominated a great part of Italy, or through their commerce, of diffusing also this branch of their civilization, the first true historical civilization of Italy, upon which was laid the foundation of that Roman power that conquered the world.

The Etruscans had as competitors for the domination of Southern Italy the Greeks, and as rivals in commerce the Phœnicians, especially those of Carthage. But these had no standing in other countries but a commercial one; their influence was not that of colonizers and a people that is essentially practical, and with precise ideals, can never have a true and individual art of its own. Hence the Phœnician influence in art in Italy is quite inconsiderable, if we take some of its special manifestations in the colonies of Sardinia (as in Nora), and of Sicily (for instance, Eryx, with its walls). Besides this, the Italians and the Etruscan spirit were profoundly diverse, and agree only in anti-semitism.

The Greeks, on the other hand, who colonized Sicily and the extreme lower part of Italy in the 8th century, and who also had perhaps a commercial influence, if they were not true colonists in the earlier times, entered as the principal factors into the classical civilization of Italy, investing the Etrusco-Italian civilization with elegance and refinement of form, without changing the substance.

We must remember that in one period of Greek history, *Magna Græcia* found itself in a more flourishing condition than Continental Greece, and that artists found in the West a better field for the exercise of their art than in their own country. The principal Greek colonies in Italy were of Doric or partly Doric origin; hence Peloponnesian art was readily diffused in Italy. The Doric temples of Segeste, of Selinunte and of Posidonia of the 6th century recall those of Olympia and Egina.

Sicilian sculpture is similar to the works of Olympia; is seen also perhaps in the less archaic metopes of Selinunte, resembling the works of Kritios, and the acroterii (Ionian) of Locri.

The numismatic art of the Syracusans was unexcelled, and their coins stamped with the signature of Euainetos are the most beautiful specimens ever executed, even when compared with those made in Greece itself.

Tarentum was not only the commercial but the artistic centre. There are said to have existed manufactories for bronze moulding, for gold work and for ceramics, the products of which are found all over Italy. One of the most singular manifestations of Greek art on Italian soil is ceramics. This western ceramic art differed from that of Greece, as well in a freer, clearer design, as in a greater richness of coloring and greater size, suitable to a barbarous style. The subjects, even the mythological ones, deal chiefly with funeral ceremonies, for which they were exclusively destined.

Meanwhile the power of Rome increased, and its dominion extended, and in it was gradually concentrated all the Italian spirit, laying the foundation of its various elements. Rome, originating in small Italian beginnings, had soon received with Etruscan domination the spark of civilization and prepared itself now to absorb Hellenism. The outcome of this was the classic western civilization, the civilization of Rome.

Early art in Rome was essentially Etruscan. That is shown by historical tradition and by the earliest, most archaic, monuments. Let us take, for instance, the tomb of Romulus in the Roman forum, the temple of Jupiter Capitolinus, etc. The mural paintings of the Exquilinus preserve the Etruscan character, although of more recent date (2d century). They belong to the historical class, and in this class, to be exact, we must place the works recorded by tradition, naming as artists Fabius, the Painter, Pacuvius, M. Plautius, Lycon, etc.

The monuments of the period of the Republic partake of this Etruscan character with the Greek habiliments; such as the constructions in clay, whether they are fortified walls, in isodoma work, where the vertical joints of one course of stone are immediately over the centre of the blocks in the course below, (Rome, Ardea, Tusculum, Satricum, etc.), or whether they are the most archaic temples of peperino ornamented with polychrome stucco work (Temple of Victory on the Palatine Hill). The very city of Pompeii, the best preserved of Latin times, has a foundation of Etruscan characteristics, later hellenized.

In architecture the Romans made great use of curves and of arches, which they learned to construct from the Etruscans, and they employed these forms in the most ingenious ways such as in the long line of aqueducts, the bold bridges, the triumphal arches, the super-imposing of several tiers of arcades, in which people pretend to trace the Hellenic influence, even to the cupolas, among which the vault of the Pantheon, reconstructed by Adrian, is conspicuous for its amplitude and solidity.

Towards the end of the Republic and at the beginning of the Empire, there were introduced into Roman architecture, together with diverse materials, different artistic forms.

Bricks of solid clay, well shaped and of regular form, small dice of tufo, or simple chips and splinters of flint pebbles, were collected into a solid mortar with chalk and *pozzolana* (a ferruginous stone from the volcanoes of Latium or Campania). The solidity of this material allowed of new constructions, especially the crossed arches, the ample arcades. As regards architectural ornamentation, the Romans, besides the Tuscan, and the three Greek styles (with preference for the Corinthian), made use of a new style of architecture, the composite, which was the outcome of the blending of the Ionic with the Corinthian.

In plastic art, the Romans soon became the servants of the Greeks, whose admirable works obscured the rude local sculpture. Only in portraits did the former maintain, until the time of the decadence, the value of nature, whether it be in form or ethical. Sculpture at the time of Augustus tried to imitate the best models of Attic art; the most perfect of the monuments built in the golden age of Rome was the Ara Pacis, the culminating symbol of Roman civilization. And into historical reliefs, inspired it may be, by Hellenic models, they knew how to put fresh life, as is shown in the reliefs on the triumphal arches, of Claudius, Titus, Trajan, and Marcus Aurelius, and in the admirable sculptured recital of the Dacian wars, which surround the column of Trajan like a *scitala,* copied afterwards in the column of Marcus Aurelius. The Roman Consuls, in their war booty, and the pro-consuls and the administrators of the provinces enriched the country with true works of original art, despoiling Greece and the Orient. What they could not steal, was copied and the copies were made with the fidelity of perfected mechanical methods. The passion for collecting art works prevailed among private persons, and Greek artists came to Italy to establish their studios, attracted by this mania of the rich Romans.

The artists of the family of Polykles were called by Metellus; Apollodorus, Apollonius, Glycon, Cleomenes, Antiochus are names of artists that may be read on the famous statues in the Italian museums, such as the Torso of Belvedere, the Venus of Milo, the Farnese Hercules. Avianus Evander was a celebrated sculptor in the service of Antonius, etc.

Pasiteles was the founder of a school which flourished in the latter days of the Roman republic and the first of the empire; a school without originality, and which, following the archaic fashion of the times, copied and adapted earlier models and composed untruthful work. Among the products of this school are the Orestes and Electra of Menelaus, in the Ludovisi gallery and the Orestes and Pylades in the Louvre and the other group at Naples.

Nero, Adrian, Marcus Aurelius, Heliogabalus, Alexander Severus, were true and real artists; Adrian left us a work of architecture, the Temple of Venus in Rome, while the Greek, Apollodorus, architect and sculptor, created the admirable works which commemorate the glories of Trajan.

To the architects and sculptors of imperial Rome, the decoration of the rich tombs, which extended for many miles beyond the gates of the city, was a fruitful field. All the most varied forms of mausoleums found a place there, from the modest sepulchral to the altar-tomb, and from the sarcophagus to the colossal tumulus richly ornamented, as for example the archaic tomb near Albano, still of Etruscan type, and the sepulchre of Cæcilia Metella on the Appian Way, of the latter days of the republic.

The Italian form of the tumulus, erected on a circular base, still prevailed; but the garments were hellenized. The imperial tombs of Augustus and Adrian still preserve that form as a foundation, while in the architectural adornment they are inspired by Hellenic monuments, such as the Mausoleum of Arsinoe in Samothrace. But there are not lacking imported, or purely Hellenic forms; shafts, *ædiculæ,* little temples, or perhaps exotics like the Egyptian pyramid of Caius Cestius, or the turreted tombs with steps, as if several buildings were placed one on the other; as, for instance, that of the Julians at S. Remy and that of the Secundini, at Treviri.

Roman painting of the more prosperous times remains only on mural decorations, and it is easy to form an idea of what the painting of easels was like and in the technical art of encaustic. If one may be permitted to form a conception of the reproductions of paintings large and small in fresco on the walls, of portraits like the mummies of Faijum, and if the «Muse of Cortona» was not an imitation of the Renaissance, it is certain that Roman art was not less advanced than Hellenic art. But it was just this resemblance to Hellenic art which deprived the Roman paintings of originality, unless it be that the samples have been destroyed of a national art, parallel with that of historic sculpture.

Decorative painting may be studied in the few examples that have survived in Rome (the house of Livy, the Farnese Palace, the Auditorium of Mæcenas, the Thermae of Titus), and in the much-visited examples in the houses of Pompeii, but they are provincial art. Similarly with painting, mosaic and stucco decoration developed (as in the so-called Farnesina house, the tombs of the Latin Way, etc.). Besides this, the artists of the Renaissance preserved sketches and designs of mural paintings, since destroyed, and it was from this art that the school of Raphael drew inspiration in its «grottesche.»

It has been possible to reconstruct the historical development of this Roman art. The first period resembled marble designs; the second, of an architectural style with effects of perspective; the third, a richer style with portraits interspersed; the fourth, ornamental and overladen with fantastic architecture, with scenes painted according to nature, alternating with copies of the most celebrated antique painting, sometimes most archaic. The prototypes of this pictorial decoration of the Hellenic epoch exist, or may be sought, in the islands of the Aegean Sea, in Asia Minor, and Alexandria.

Mosaic and the *opus sectile,* or colored marble inlaid work, were also of oriental origin. In the most ancient mosaics with large tiles or stones and few colors, the motives are simple: divided into mythological figures, animals and fishes. Then there were represented, in a greater variety of colors, fishes and other animals, little tables covered with the remains of the meal, until with a more refined technique (*opus vermiculatum*) they made regular and true pictures, hunting scenes, as in the great mosaics of Præneste, and gladiatorial scenes, as in the mosaics of the Thermæ of Caracalla, and contests in the arena, etc., until they succeeded in copying true and real pictures, such as the Battle near the Issus, found in the House of the Satyr (Faun) at Pompeii.

In industrial arts the Romans, especially in the provinces, obtained fresh results. In the

history of Italian ceramics, the production of types derived from the Greek ceased with the Calenian manufactories, and in Etruria arose the manufacture of vases and the plastic ornamental work of Orvieto, then the delicate cups of Arretium, made of the finest clay, sometimes silvered and gilt, in the work of the Alexandrian *toreutic*. The names of these manufacturers are known: the celebrated Canuleius, Gabinius and Attilius, and Popilius Attius, and it is supposed that these vessels were not imitated directly from the gold and silver vases, but from cups in relief of Megara. The glass industry, which throve principally in Cisalpine Gaul, blown and colored, or turned on a wheel in the style of glyptics as in the *murrinæ* cups, and the *vasa diatreta*, or even in the style of cameos, little by little supplanted the use of terra-cotta for table purposes, and gave the death knell to the elegant vessels of *figulina* clay. Also the vessels made of precious metal kept alive the traditions of Alexandrian art, and we have an example of it in the rich silver furniture of *Boscoreale*.

In glyptics, the Romans continued the traditions of Greece and especially the Hellenistic traditions in the great historical cameos. In the art of working in gold they remained inferior to the Etruscans, although they surpassed them in artistic models inspired by the Greek models.

What the art of the cabinet maker was able to produce in Roman times is found in the scarce specimens of furniture, inlaid with ebony and ivory, and encrusted with metal and precious stones, engraved, or sometimes in relief, appliques compared with paintings in which objects were represented, made of materials easily destroyed. It is worth while here to recall the beds (in the Palace de Conservatori at Rome, in the Museum at Naples, and in the Kircherian Museum), the litters (in the Palace of the Conservatori), the *tensa Capitolina*, and the ivory beds of Ancona.

The weapons of war also present rich decorations, especially those for parade, the imperial arms (the sword of Tiberius), or the gladiatorial weapons (Naples).

The limits of this article do not permit consideration of the art of caligraphing and miniature, so richly developed in the Middle Ages; as seen in the beautiful codices of Virgil in the Vatican, and of Terence, and the Iliad of Milan; and others which prove that the classic age did not lack the taste for art in books, which is shown in the beautiful shape of their characters, as well as in the scenes which illustrate their books. To the Romans belong above all the classical nations, the merit of giving an artistic shape to the letters of the alphabet.

But the very power of Rome which extended itself over a great portion of the known world was the cause of her decadence. Whilst the new classical civilization diffused itself beneficially in barbarous countries and art in these places assumed a provincial character, Rome absorbed fresh ethnical elements, and with these the germs of artistic decadence.

The mania to obtain grandeur through hugeness, richness through a plethora of ornamentation, was the cause of this decay. The barocco style was the signal of this decline in art.

In the public edifices there was already to be noticed this exaggeration: if, for instance, one stood before the Forum of Cæsar, and the Forum of Augustus which surrounds the beautiful temple of *Mars Ultor*, with *Forum Pacis* and with that called of Nerva, in which is seen the most refined minuteness of ornamentation, proper in the second style of the 1st century, and then the immense Forum of Trajan, an admirable group of edifices, worthy centre of a capital of about a million inhabitants, we may see already in the golden age the tendency to excessive immensity. And it is still more instructive to compare the Thermæ of Agrippa and of Titus, elegant and moderate in size, with the enormous constructions of Caracalla and Diocletian, where the amplitude of the arches becomes gigantic, and the incrustations of colored marble give the whole an oriental polychrome character.

The Orient, that land of the origins of civilization, has disburdened many times on the young West the ardor, the softness, the exuberance of its thousand years of civilization.

At the time of Diocletian and Aurelian, we see the rude constructions of Spalato and Salona, or of Baalbec, in which are found the lines, in which are piled up cornices, the foliage, animated by figures which move in the incaulicoli of the capitals, triumphant on the keystones of the arches, climbing on the bells which seem broken or distorted by a convulsion which agitates all the lines, moves the plants on the façade. And all this requires to be imagined as constructed in marble and metals splendid in coloring, a vision which forecasts the Byzantine churches, six centuries in anticipation.

Plastic decorative art had a similar course. If we compare reliefs on the arches of Titus and Trajan, which with their three arches show an amplification of the pure Roman arch of the golden age, with the superimposing without life of the figures on the arch of Septimius. The monotony of the motives is reflected in the particulars, for instance, the parallelism of the folds. Only in portraits was the characteristic style kept alive.

And when Constantine, improving on the various elements of better times, of Domitian Trajan, etc., gave orders to compose a monument of this order, the few reliefs that were added were, like the ivories of the *Diptycha*, like the Christian sarcophagi, the Omega of classic art and the Alpha of mediæval art in Italy.

There is little to say about the minor arts in Italy in the centuries of decadence. Decorative painting was to a great extent supplanted by mosaic, the *opus sectile*, by tapestry and textiles. Gold work began to take on barbaric forms which came from the peoples of the North; the fibulas with rays are an instance. Glass work, the flourishing art which also came from the barbarians, continued to produce many tinted and artistic vessels, and glassware, incrusted with gold with engraved designs, and the enamel in colors which was introduced into mosaics, became the fashion.

In Roman art during the decadence there were in embryo all the forms of mediæval art, and for a time they were none other than the continuation or the revival of these forms, and the historical and traditional end of the fall of the empire cannot be taken as the period which distinguishes classical from mediæval art. And in treating of this, we must consider the Roman monuments of the 4th century. Whoever, therefore, studies classic art may be said to have exhausted his list in the artistic examples of the 3d century.

Lucio Mariani,
Professor of Archæology, Royal University of Pisa.

23. Italy—Historical Synopsis of Italian Art. From the time of Constantine to that of Justinian the Latin nations have gathered together the inheritance of preceding ages in order to transmit it to the modern world. Under the stratifications of Hellenic art in Imperial Rome may be found poor, coarse popular forms which, on the decline of the Roman splendor clearly represented the artistic potentiality of the Latin race. By constant moulding and remoulding these became the consecrated forms of Pisano and Giotto; just as, on the decadence of Roman culture, the noble, the dignified words of Cicero and Tacitus were forgotten in the vulgar expressions of a common speech which in the course of slow transformation became the language of Dante. Besides the popular, or rustic forms, not subjected to the laws of classic art, the patrimony of the Roman arts became enriched with all the Greco-Roman forms that had become common, and whose types were found everywhere, in the workshops of the stone cutters at Rome, and in the provinces, even to the southern boundaries of the Roman and Phœnecian colonies of Northern Africa.

The conservative popular spirit of the Middle Ages long preserved this nucleus of form, a precious legacy left by the liberties and the slaves of Rome to the new and almost savage masters of the West. To this may be added those simple and modest forms of Christian art, which had endeavored in the catacombs to give an humble reminiscence of the elegant scenes of the life of the gymnasiums, and a tender form to scenes described in the Holy Book and suggested by Christian imagination. There was an artistic tradition in the representation of biblical themes, common to Occidental and to Oriental Christianity; and not alone were there certain symbolical types, but sometimes also the distribution itself and the lines of composition were preserved, through the Middle Ages. Many artistic forms of this epoch, so poor in imagination, reject the ancient origins, and, in spite of the added incrustations of time, the modifications and the restraints imposed on them, go back to early Christian types.

But there were also some Etruscan forms. As the etymology of the Romance languages shows us a group of words derived from the ancient Italian dialects, so also in the arts we can trace these indigenous forms across the centuries of the Republic, which were not extinguished by contact with a triumphant art, nor conquered by other forms which had migrated from the Occident. Research into the relations of Etruscan art to the Roman arts reveals a series of important facts that, as we trace in them the vestiges of Etruscan civilization, reminds one of the detritus of the mountains which forms the fertile soil of the valley.

From Syria as from Byzantium in contact with the eternal examples of Greece, as from Asia Minor and Egypt, there spread through the Occident, and principally in Italy new forms, —living, rich, splendid, which were transmitted from generation to generation, from age to age, like the old songs and the old stories.

The German elements did not introduce any substantial deviation from the organism of Italian art. The Romance languages gained principally in warlike terms, but art cannot receive contributions from barbarians such as the Lombards who could not have a special architecture. When Roman art lost its peplum of majesty, the barbarians came and covered it with many colored vestments resplendent with rubies and garnets, brilliant clasps, necklaces of glass and amber set in gold. The arrival of the Lombards in Italy marked the period of extreme decadence; with it began the animal form of decoration, peculiar to Germany, in the special mediæval forms, where pass in review gryphons, centaurs, which look like the Oriental marthicore, and serpents, lions and leopards. And all is rigidly fashioned: man, the wild beast, the plant, are so represented as to be unrecognizable.

From the 7th to the 11th century, Italian art slowly elaborated the traditions of the *bassi tempi* (decadence), repeated hereditary forms in a more or less uncertain manner, using methods that were sometimes childish. There was no real revival in decadent art during the rule of the Lombards. Before the struggle of the Iconoclasts, Italian artistic decadence had reached its extreme limits, and during this struggle Byzantine art could not have found a refuge in Italy. Byzantine art at that time weak, persecuted, condemned by the very persons who should have protected it, had not the force in itself to diffuse itself in the world. Nevertheless the struggle of the Iconoclasts helped to further the progress of art. Certain ancient types had to become daily more obscure and mystic, farther from the common life. And the naturalistic decoration, which took the place of the sacred images, depicting animals of every species, representations of hunting and fishing scenes was not transitory, for it remained in the work of mediæval art.

While the Occidental empire was being politically reestablished, Carlovingian art attempted a reconstruction of the fragments of classic art. In the monasteries, the refuge of ancient science, through the influence of Cassiodorus the ancient manuscripts were transcribed. Architecture also revived: the Basilica of Germigny-des-Près was constructed by the Italian Teodulfo. Particularly, in Lombardy, more subject to the influence of the Carlovingians, there arose churches, manuscripts were illuminated, and the greatest monument in gold work was constructed in the Carlovingian age, in the altar of gold of Saint Ambrosius in Milan, the gift of the Archbishop Angilberto II., constructed by

Vuolvinio and completed in the year 835. Other signs of artistic revival were at this time seen in various parts of Italy; but before Italian art could assume its own special forms, new influences intervened from the direction of Byzantine art which, about the 11th century, flourished with Greek beauty.

After the 11th century art sought to adapt itself to the country, to air, to light; and there was introduced into art a tendency to new expressions. Already in the 12th century romantic art flourished: its towers rose like lances from the projecting plain of the human hive; castles were erected; cities were surrounded by fortified walls; and in the midst of the towers, the castles, the houses, there arose the Cathedral. The instruments were rude which sought this expression of life, but they became refined by work; breaking the stone, cleaving the caves of the mountains of Luni, of the Veronese, of Lombardy, and of Istria. There were as yet few examples that taught the virtue of ancient art, but in Etruria the various Artinians appeared as if descended from the sky at Ristoro d'Arezzo; from the sarcophagi and classic marbles, Woligelmo and Nicolas took the decorations of the cathedrals of Emilia; from the Italo-Greco vases of Apulia was formed the beautiful style that Niccolo afterwards rendered eternal; from the columns of the temples of Athens, Syracuse took the form for other Christian edifices. In the soul of romanesque art, lives ancient art; there remain in it traces of triumphal arches, of Thermae, of theatres, forums, reflections of the provincial rustic Roman forms, of the legionaries, the sarcophagi of the Roman decadence (*Bassi tempi*) and of primitive Christians; but the aspect of the fine arts changes and varies, owing to the tendency of the indigenous Latin elements to compose themselves into national forms, just as the *langue d'oc* and the *langue d'oel* are different from the language *del bel paese dove il si suona.* From the ancient stem of Roman art new roots sprouted, wherever the standards of the Roman legions had once passed by.

Of the edifices erected in the Romanesque period there are few remains in Northern Italy. The houses were usually of wood, thatched with matting and straw, and only in the 12th century did they begin to formulate ordinances for the covering of the roofs, to prevent the frequent fires. And the houses were built everywhere, and in the 13th century palaces were built in the shadow of the towers, palaces of Reason, palaces of the Podesta, and of the Capitano. Mantua, Cremona, Piacenza, Milan, Como, Bergamo, Brescia, Padua, Vicenza, Monza still retain some of these palaces called Palaces-of-the-People, or of the Commune, of the public, of reason, of the consuls, of the Prœtorium, or of the Broletto. The timid ferocity of mediæval man is shown by the towers against which the houses nestle as if for protection and defense. In the 12th century when civil discords were raging, the towers were crowded in the cities of Lombardy, and Pavia received the cognomen of «towered.» The very high tower erected at Bologna in the beginning of the 12th century by Gherardo Asinelli is famous; and the other, erected about the same time, and at a short distance, near the house of Garizendi. Meanwhile the summits of the Appennine hills became covered with castles; and the chronicles tell of continual incendiary fires, assaults, destruction of castles. The towers of the gates and of the fortifications were crowned with battlements in which were loopholes, at the gates there were fortifications, or barbicans, and in the 13th century drawbridges. From tower to tower they fought as from battleships trying to grapple; the vanquished one was broken down, or razed to the ground.

Romanesque architecture developed greatly in Piedmont and Monferrato in the 11th and 12th centuries, and it was with these regions as with Liguria, that they brought into Italy French forms. In Lombardy the new systems of architecture found the most ancient application in the church of St. Ambrosius, at the beginning of the 12th century, at the time when San Michele arose again in Pavia, a signal for a restoration of architecture; in the Cathedral of Modena, of which Lanfranco was the architect; followed by the cathedrals of Cremona, Piacenza, Ferrara, and Verona; by the Abbeys of Nonantola, of S. Benedetto di Polirone, by San Zeno di Verona. Several of these churches no longer retained their primitive form, but there were not wanting traces of their ancient common origin.

The Venetian architecture of the 11th century marked the great vital flower of the powerful republic which, in the frequent contact with the art of the Byzantine Empire fashioned itself on the Oriental without rejecting, however, many forms of the Roman decadence existing in Ravenna and Istria, and gathering to itself also the new arrivals from Lombardy by way of Verona. The Basilica of San Marco rebuilt in the second half of the 11th century expresses in the highest degree the importance of Byzantine art to Venice.

In Tuscany Romanesque architecture developed very early. Pisa, (a flourishing republic in 1063) undertook to construct its own cathedral, as Venice had done, and about the same time constructed her San Marco; and Lorenzo began, in 1013, on the hill of San Miniato the noble Basilica, and at the same time his baptistry, *il bel San Giovanni*, reconstructed the ancient «duomo» (cathedral) or the church of the Abbey of Fiesole, erected the ancient parish church of Saint Andrew in Empoli. In Lazio there were not many examples of Romanesque architecture; in Umbrian architecture the Romanesque characteristics prevailed, as in Rome and its environs; in the Marches the most complete monument of Romanesque architecture of the 11th century is «Santa Maria di Portonovo;» the most splendid, the cathedral of San Ciriaco at Ancona, since then restored in the 13th century. In Apulia the first restoration in architecture was owing to the labors of the Benedictines, then to the diffusion of Northern characteristics and of the contrasting Byzantine forms. In Campania, particularly in Caserta Ventria, we see the blending of Arabic and Norman elements, as in the churches of Sicily, and in portions of the Apulian cathedrals. The efforts of the Norman-Sicilian art are triumphant in the Cathedral of Monreale.

Romanesque sculpture, developed in Northern Italy in the cathedrals of Emilia through the

work of Wiligelmo and Nicolao, reached a certain eminence under Benedetto Antelami, under the Veronese sculptors, under the Venetian sculptors, the restorers of the Christian type.

In Tuscany its development was delayed; in Lazio (Latium) it was more especially decorative in the hands of the sculptors and Cosmati, who supplied the churches with their ecclesiastical furnishings; in Campania, in Apulia, in Sicily, it flourished in the time of Frederic II.

Under Frederic II. the Gothic style entered Apulia, the Basilicata, Abruzzi, and became common everywhere in the 12th century, and sought to adapt itself to the surroundings, the traditions, the life of Italy. From S. Maria d' Arbona, from Fossanova, the influence of the Gothic style was spread by the instrumentality of the Cistercians, throughout all the continent and in Sicily. From the Studium Artium of the Monasteries there came artificers who introduced everywhere the Gothic style. And the influence of the Cistercians extended also to the other religious orders, and lasted until the local Italian schools, the masters of the new art, blended them and finally superseded them: expanding, consolidating the Gothic; and until square and plummet passed from the hands of the monks into those of the laic masters.

In the *Dugento* (13th century) pictorial art was still in its infancy. Human affections could barely be perceived overcoming the rigidity of the material, popular forms being substituted for ecclesiastical forms, the tender aspects of life for the uncultured representations of things, adolescence in flower for the Romanesque asceticism. The love of nature which from the beginning of the *Dugento* was manifested in the Canticle of the Sun (*Cantico del Sole*) by San Francesco d'Assisi, and became potent with the lapse of time; but not the cell of reeds of the Holy Francesco, not the Poverty that was his bride, not the foundation stone of reality was found in the new art. The monk of Assisi spoke of love—and art understood in its own fashion, and over the remains of the saint erected the most beautiful House of Prayer that the world can boast. Beato, Margaritone and Ginuta have attempted to portray it; but art is not competent as yet to describe its proportions, it has no words or phrases to express them. From Bertinghieri to Orlandi, from Ginuta to Rainerio d'Ugolino, from Margaritone to Guido da Siena there is a slow progression of low forms. In vain does modern criticism seek to exalt Guido da Siena and make of him the representative of the Renaissance as it boasts of his pictorial palimpsest in the public palace of Siena. In the *Dugento* (13th century) *Roma docet!* Torriti created more splendid mosaics; Pietro Cavallini, in his mosaics and frescoes, created the new art with the old Roman soul; Filippo Rusuti introduced contemporary costumes into the mosiacs of Santa Maria Maggiore; Giovanni di Cosma, in his sculptures and his enamels makes the latter brilliant with the Cosmatesque forms, in the twisted columns, in the facade of the edifice. Among these masters we find Cimabue, athletic, powerful, who in Assisi in the calvary of the greater basilica created the drama of Golgotha.

At the close of the heroic period of Cimabue, of Pietro Cavallini, and of Torriti, began the modern age of art with Giotto, and the new style was imitated. Giotto is the first free painter, the painter of the truth of life. In the basilica of Assisi he renewed everything, giving free play to his emotional nature, taking advantage of fleeting impulses of sentiment, determining the characters of men and of things: He continued his work of restoration at Rome, Florence, and Padua; and again at Assisi; at Naples, and again at Florence and at Milan, crowning the efforts of the past and being the forerunner of those of the future. His genius dominated the 14th century (*Trecento*); a whole constellation of artists revolved in his luminous orbit. Throwing aside the royal mantles, the accoutrements of the Byzantines, Giotto draped his figures in the humble garb of the people; and he listened to the voices of souls, to the murmurs of sentiment, to the cry of the passions. Giotto, like Dante, with rapid strokes portrayed the living emotions; now representing Magdalen regenerated by grace; now the blessed Francesco who loved the Sun, the little plants, all his fellow creatures, the rock on which he rested, the dawn which chased away the darkness, the birds which flew around him who would not injure them. And in the Church of Arena at Padua the painter portrayed the life of Mary («*umile e pia piùche creatura*») (more pious and humble than any creature), from the joys of maternity to the sorrows of exile, from her atrocious sufferings to her everlasting joys; and in Santa Croce at Florence he added John the Baptist who did not tremble before the tyrant and died praying, St. John the Evangelist, who rose to the contemplation of the mysteries of the Hereafter; and in the palace of the *Capitano* at Florence God sits in judgment on Florence the lowly and the great, surrounded by a chorus of Florentines, among whom is Dante the painter poet, who gave form to human knowledge.

Venetian and Florentine art met together in Florence, penetrated into Umbria, into Assisi, and at last into the Marches. At Siena, the city of the Virgin, painting flourished without the dramatic impulse of Giotto, without his simplicity of the people. Durcio di Boninsegna, who in Florence had collected the forms of Cimabue and adapted them to the elegance of the Byzantine school, had made them resplendent with imperial richness, and moulded them in the rigid ecclesiastical mould. Simone Martini, a follower of Durcio, a friend of Petrarch, the painter of Laura, supplemented what was lacking in Venetian art. Gradually his coloring grew warmer, and the gold changed to crimson. At Assisi he worked with his brother Donato; at Avignon he appropriated the colors of the most beautiful gems and created a school which hastened the advance of painting in France. At Siena, Lippo Memmi, his cousin, produced his beautiful works and also at San Gimignano, at Orvieto, and at Pisa; the Venetian miniature painters reproduce them in the Hymnals (Books of chorals) and the Liturgical books; at Avignon another imitated him in illustrating the parchments of San Giorgio, of Cardinal Jacopo Stefaneschi.

While Siena placed the aristocratic forms of

Durcio and Simone Martini in contrast with the popular forms of Giotto, the brothers Lorenzetti of Venice modified art at their expense. In the court house of Siena, in that monument of civil wisdom painted in conformity with the dictates of the doctrines of Aristotle, and at Arezzo, Assisi, Florence, and Massa Maritime, the two brothers displayed their part: beautiful Ambrosio Lorenzetti in Tuscan garb; and impetuous, rough, savage, dramatic Pietro. The blending of the forms of Durcio and of Simone Martini with others foreign to Siena, appropriated and assimulated by the Lorenzetti, endure until the beginning of the 15th century in an innumerable series of works, in the constellation of Venetian artists. The diffusion of the Venetian style was widespread: it conquered Pisa; Barnabo da Modena accepted it; Allegretto Ruzi and Francescuccio Ghissi retain traces of it; Andrea of Florence was subject to it; Lorenzo Monaco was taught by it.

At Florence the traditions of Giotto held the ground during all the 14th century; and in Agnolo Gaddi, who carried out the ancestral models, they stagnated. Spinello Aretino shook off the somnolence of Florentine art in the second half of the 14th century; and at the same time was the forerunner of an art that sought new ideals, renewing itself in the combined study of the antique, and of nature. At Florence, in the middle of the 14th century Giovanni da Milano labored and presented Florentine art on the banks of the Arno. The decorations of these two oratories (chapels) resemble that which was employed by Avanzo and Attichiero from Verona to Padua, of which there are noble instances in the beautiful chapel of San Giorgio, and in the chapel of San Felice in the church of that Saint. Giusto de Menaturi of Florence is a conventional artist in comparison with Avanzo and Allichiero of the new school; Guariento is a painter who labors to escape from the rigidity of the Byzantine school. Avanzo and Allichiero created historical scenes with greater aptitude, and portrayed in review noblemen with their families being conducted by their patron saints to the Altar of Divinity. With Aranzo and Allichiero, with Antonio Veneziano who revealed his genius in Pisa, with Tommaso da Modena, the painter of the story of Saint Ursula at Treviso, began the new Springtime of pictorial art in the north of Italy, at the end of the 14th century.

The popular *motif* impressed on pictorial art by Giotto was similar to that impressed on sculpture by Niccolo d'Apulia (called Nicolo Pisano). This style appeared for the first time in Tuscany, at Lucca, in the carving of one of the side doors of S. Martino; and in it Niccolo showed that he had adapted with great ingenuity the power which breaks forth in the antique art, the fullness, the robustness, of sincere naturalism.

We then see him in Pisa engaged in decorating the exterior of the Baptistry, the first row of arches, placing at their junction and on the keys heads and busts where the human element is restored by the genius of Niccolo with a power such as to compel us to declare that modern art in its inception has spoken the final word. When, with the aid of his followers he had completed his great work and was preparing to carve the pulpit of the Baptistry at Pisa, he had bestowed on him the citizenship of Pisa, and was nominated a citizen in its Hall of Fame. From the pulpit of Pisa (1260) to that of Siena (1266-68) the style of Niccolo's art spread rapidly. At Pisa it is more forceful, grander, more monumental; at Siena it is more Christian, more dramatic. Under the impulse of genius the monument grew with great unity of form, at the same time allowing one to distinguish the individuality of the workers, especialy of Giovanni Pisano and of Arnolfo. From Siena, Niccolo d'Apulia went to Pisa, thence in 1273, to Pistoia; in 1274 to Perugia for the work on the fountain of the Piazza Maggiore, brought to completion by Giovanno Pisano, his son; in 1278, the year of the death of Niccolo, that great genius who by his art constructed a bridge between the ancient and modern era. Pisa, educated by him, was the teacher of Italy.

While the Baptistry of Pisa was wreathed with garlands, the Pisa Camposanto received the bodies of men in holy ground brought from Calvary, and the Pisa cathedral (Duomo), raised its superb front beside the Leaning Tower; the Pisano journeyed to Lucca to decorate the beautiful San Martino; to Perugia to sculpture the fountain where, amid the water jets, sounded the voices of the virtues, of the liberal arts, of the Bible, and of history; at Siena in placing on the front of the cathedral the prophets, the sibyls, Plato, Aristotle, who impelled by the ecstasy, the fury of poetic rage, proclaiming the coming of the Word, or the Eternal Truth to the Faithful; from the ox-like eyes of the Patriarchs; from the cavernous eyebrows of the philosophers, from the convulsions of the sibyls there came blinding flashes and enormous dragons, and horses rushing forth from billows of marble. Thus Italy was conquered by the strokes of the chisel of the school of Niccolo d'Apulia; of Giovanni Pisano, who made his statues pulsate with passion, spread his paternal art throughout Tuscany, in Umbria, and in Venetia; Arnolfo, his comrade, invested his marbles with the ancient beauty, and at Rome he was victorious and transformed the art of the Cosmali; Andrea Pisano cast in bronze the door of the Baptistry at Florence through which modern art passes triumphant; Tino da Camaino founded in Naples the school which, until the Quattrocento, repeated the artistic dictum of the Pisan school; Giovanni di Baldunio da Pisa brought models to the masters of Campione and Como in his arch of Sant'Eustorzio at Milan. Towards the close of the 14th century Venice, as she had already done in painting, elaborated new forms, and among other sculptors Farobello and Pier Paolo dalli Maseque are prominent. These all diffused Venetian sculpture throughout Italy, at Bologna, where it held the field, to Milan; places where the florid Gothic founded the last of its great monuments, the Basilica of S. Petronio, and the Cathedral of Milan.

The *Quattrocento* gave form to national ideals, without losing in fidelity to nature, intensity, passion, soul. It did not sacrifice itself for the sake of effect; it spoke, but it did not declaim rhetorically. From the yet rude forms, from the realistic harshness spring the most beautiful flowers of sentiment. The True was

worshipped with childlike curiosity and tenderness. Romanesque art downtrodden by the Gothic, was not destroyed; it returned resplendent amid the Gothic, it had become more ample. Amid the pinnacles and the spires it insinuated itself, pausing in its experiments, and, expanding the proportions of architecture, rounding the sharp corners, squaring the contours, planing the summits, it regained its ground. The antique forms were recast, and blossomed again among the Christian. Not forgetful of its ancient life, of its glories, of its motives, Italian art recalled the classic statues; the nude saw again the light of day, even at the entrance of the churches, for the beauty of the nude form no longer seemed a demoniac qualification, but a gift of God. Art, in its new youth, was the forerunner of humanism, of a restored civilization.

Architecture in the *Quattrocento* received its first impulse from Filippo Brunellesco, the friend of Paolo Toscanelli. The cupola of S. Maria del Fiore is the principal monument to his glory; Michelozzo and Giuliano da Mariano are his principal followers. Leon Battista Alberti was more Roman in his architecture; was the designer of the temple dedicated to the Goddess Isotta by Ligismondo Pandolfo Malatesta at Rimini; the more refined Bernardo Rossellius, who at Piacenza created for Pius II. the Piccolomini palace, and the palace of the Commune, the cathedral and the Campanile, a whole city clothed with rare elegance.

With a Florentine grace, with a witching delicacy Luciano di Lamana created the palace of Pesaro, the newer portion of the palace of Urbino, and that of Gubbio for the Lords of Montefeltro. Benedetto of Milan built the model of the Florentine city palaces, and that of Strozzi in Florence. Bramante d'Urbino, first in Milan and then in Rome, gave the crowning glory to the architecture of the 15th century.

Painting in the 15th century displayed itself in the cities of Italy in a variety of types, many colored like their flags. The palaces of the nobles were adorned with frescoes; the churches were splendidly decorated. Every public festival was a festival of art. If the mysteries and the comedies of Plautus and Terence were presented, if the crowd endeavored to do homage to their lords, if the princesses were going to their wedding in their bridal carriages, art improvised machines, scenery, arches, triumphs. They carried the maidens to their wedding; and art gave them as furniture the nuptial chests painted at that time with the Boccacian fable of Griselda, or the Triumphs of Petrarch, the anchor with the Madonna seated, the Holy Child in her arms, the illuminated Book of Prayers, and the Gentilezze of goldsmiths. Art in the beautiful *Quattrocento* breathed in all things, in the Majolica vases, in the brocaded robes, from velvet to brocade, in the leather cover of the ledger, as in the binding of books of devotion. From the cradle, ornamented and beautiful, art guided man until he slept beneath the sepulchral arches between the chapels, escorted by Virtues and the Liberal Arts. In the *Quattrocento* art was in the atmosphere, it permeated all the social life. It appeared as if in ancient Olympus the divinities were obliged to clothe themselves in the costumes of the citizens of the *Quattrocento;* it seemed that the heroes of antiquity were restored to life to enlist with the soldiers of the republics and of the Italian Signoria; it seemed as if the biblical figures revived to take their place among the officials and mayors of the corporations; it seemed as though God and the Saints descended from the clouds to take human form. Every figure sacred or popular, allegorical or historical, found in the society of the artist his garment, or his background. There were no longer conventional forms, but imaginary or historical scenes were represented with such simplicity as to make it appear that one had seen them with one's own eyes in the public square, or along the streets of one's city, on the verandahs or under the wooden ceilings in one's own house.

To Masolino da Pamcale and to Masaccio, popular masters, belong the boast of having designed in Tuscany the new ideal of the art of the *Quattrocento.* The relation of their sculptured figures to the landscape is determined, the perspective assigns everything to its place; anatomy invests with bones and flesh the human form, which lives and moves in a real world, its individuality reconquered. Less modern, still Gothic, were the paintings of these times by Gentile da Fabriano, who had, as Michaelangelo says, a hand as refined (*gentile*) as his name; and Pisanello, a true painter of animals, who sought out their instincts, discovered their habits and their movements. The two masters left their influence on many parts of Italy, in Venetia and in Lombardy; in Emilia and in Tuscany, in Umbria and in the Marches, in Rome and Naples. But meanwhile Piero del Borgo, or Piero della Francesca, exercised the greatest influence on the new style of painting; at Urbino, at Senigallia, at Rimini, at Bologna, at Ferrara, at Padua he taught the art of perspective and left along his passage a trail of light like a comet. The stern painter «*monarca a suoi di*» (monarch in his day), as Luca Pacioli said of him, brought the science of perspective to the height which it reached with Leonardo da Vinci; his figures have a great luminosity in the clear air, transparent and light shadows, flesh tints faintly rose-tinted, tender coloring of Spring flowers.

While Piero della Francesca gained so many portions of Italy for Tuscan gracefulness, at Florence, Fra Giovanni da Fiesole, called the "Blessed Angelico" was painting, depicting diaphanous angels and saints *veramente di Paradiso.* His art had the effect of a sweet psalmody. The ladder seen by Jacob in his dream, upon which fair angels ascended to Heaven, was seen anew by Giovanni, whom posterity called the Blessed. He composed sacred scenes with great ingenuity, with a childlike simplicity, his Madonnas clothed in Gothic tunics, with clear eyes, whose pupils look out from beneath their faintly penciled eyebrows, and with the lithe, slender bodies of children. Benozzo Gozzoli and Fra Filippo Lippi gave substance and development to these forms, but not the innocence of Angelico; Andrea del Castagno and Paolo Uccesso loved strength and science rather than mystic contempla-

tion; Pesellino, youthful, gentle, sought more than did Angelico mere corporeal beauty. In the realistic work of Andrea del Castagno and of Paolo Uccesso, in the studies in perspective of Piero della Francesca, Baldovinetti, Pietro and Antonio Pollajuolo, Andrea del Verrocchio took their inspiration and sought for plasticity of form, the robust structure of the human figure; the grace of Fra Filippo was imitated by Sandro Botticelli. Through him, Florentine art became a canticle of Spring, all redolent of jessamine and roses. The followers of Botticelli, Filippino Lippi, and Ghirlandaio, closed the great era of Florentine painting of the *Quattrocento*. Among them Luca Signorelli di Cortona, sunburnt, warm, ruddy, rose to the summit of art; he was strong, quick and resolute. The Cortonese (Luca Signorelli) retained his character of a mountaineer, but beneath his rough exterior he had a soul of fire; his nude figures seem to be chiselled as if by the strokes of a hatchet, but from the strokes issue robust and healthy bodies.

The Tuscan school of the *Quattrocento* had as the crowning glory of its sincere efforts, of its indefatigable research, the work of the giant, Michaelangelo, of Leonardo, the prophet of modern times. Michaelangelo remained a sculptor in his painting; his prophets, his sibyls, have the imperial cast of the Moses who arises, terrifies and thunders. The painting of the *Quattrocento* had sought the grace which he disdained; had been prodigal of flowers and smiles to the sacred figures into which he infused a sculptural, monumental grandeur; had refined and prettyfied everything, whilst he enlarged everything and raised it to the sublime. His athletes wrestled under the power of his gaze, and reposed solemnly in the corners. The physiognomical traits of his figures disappear, to give place to the lineaments of the imagination; we cannot see into the foundation of the works of Michaelangelo, for the man himself, alone, fills the entire space and breaks down the obstacles and the limitations from within; life dwells in him, and breaks forth from him.

Leonardo da Vinci, excited at his vision of things, impelled always by an irresistible desire of something new, restless because of the sense of perfection, which ever vaster horizons had hitherto denied to his attainment, left uncompleted the greater part of the works that he had undertaken, because he found matter inadequate to depict the soul of things. Sublime in every stroke, in every word, even in his own day Leonardo appeared a prodigy. Lombard painters turned their eyes towards him, as satellites around the sun. The purified idealism had come down through the ages, the multiplied energy of generations, and had found their expression in the marvelous man who defied study and analysis.

Other regions of Italy had also their geniuses who regenerated the ideals of nature; the days of accomplishment came when the iconographic progress made great strides, and idealism became purified in the course of ages.

In the Marches and in Umbria the painting of the *Quattrocento* took the form of the representation of sacred and allegorical subjects, as though invaded by the spirit of the populace who went through life with a scourge; and it fell into a forced naturalism, into a vulgar conventionalism. Niccolo Alumo appeared sometimes to be a savage who broke forth into shouting and depicted sorrowful, wrathful, disconsolate figures. Like him, Crivelli, the Venetian, who also looked at the world with the eyes of a magpie, came to the Marches to get force of expression, in exaggeration and grotesqueness. But the suavity of Tuscan art breathed into this region the fragrance of Spring flowers in Piero della Francesca, in the Blessed Angelico, in Benozzo Gozzoli, and in Verrocchio; and its Fiorenzo di Lorenzo, Perugino, and Pinturricchio. Perugino invests his figures with a rare grace, although they all bear the imprint of the same model, have all the same sentiment of devotion, of humility, of abstraction; his saints gradually become rosy, ethereal; his personages are transformed into a monotonous, melancholy, mellifluous type. Pinturicchio, frequently the companion of Perugino, was intoxicated with color. From the works of Perugino, in particular, was moulded the crowning genius, of the ideals of art of Umbria, and the Marches; Raffaello d'Urbino. In his first works, in the incomparable sweetness of his youthful Florentine figures, most delicate in movement, he exhibited his tendencies; in the work subsequently executed in Florence he drew more from the examples of ancient and modern art that was triumphant on the banks of the Arno; in those he painted in Rome the great assimilator gave us models of monumental art. Raphael, who had sought at first in Perugino the sweetness of the devout Umbrian maidens, in Florentine art, the noble elegance, became, in Rome, a child of the South; and idealized the vigor of the peasant women of the Roman Campagna, with ample proportions, bronzed with the sun; and of the children with their large eagle eyes, and black hair. The last of his works was the Transfiguration; his pupils placed the picture on his bed when he closed his eyes forever, the *gentilissimo Raffaello d'Urbino*.

The Emilian region gave tardy signs of a revival in painting. From the school of Squarcione at Padua were cast seeds also in Emilia. Cosmé Tina of Ferrara appeared at the beginning of the second half of the Quattrocento as the head of a school, a great smith, who with the blows of a hammer wrought figures in sheets of metal, and illumined them as from an inward flame. At this time also flourished Francesco del Cossa, rugged in his saints, with enamel-like coloring. Ercole de Roberto, Lorenzo Costa, and Ercole Grandi were disciples of these two masters. Returning from Ferrara to Bologna several of the masters of Ferrara, Galasso, Francesco del Cossa, Ercole de Roberto, Lorenzo Costa, held the field in painting. A comrade of Costa was Francesco Raibolini, called Il Francia, a painter of

scrupulous conscientiousness, of a well-ordered intelligence, with a simple and pious mind. A contemporary of Francia was Francesco Bianchi Ferrari, of Modena, a painter with an accuracy of execution that had something of religion; and he was the master of Correggio, the youth, of the genius who took his place at the apex of Emilian art. Except for his first figures, which partook of the spirituality of Bianchi Ferrari and of the Mantegnese solidity, Correggio held his own as a colorist, and appeared to draw his tints from rubies, sapphires, topazes, and amethysts, from the sap of the rose, the brightest colors of the rainbow, the most diaphanous shadows. Correggio was the painter of light. With his colors, harmonized like the sounds of a lyre, he diffused happiness and joy around him in all hearts. In the blending of the lights and the shadows appeared his Danae; on the Autumn landscape distilling gold from the verdure, his Leda; in an aureole of golden hair, his Antiope asleep; enfolded in a downy cloud of love, the nymph, Io; poised in space, Ganymede, while the zephyrs toyed with his blond locks. His angels in the Madonna di San Francesco di Dresda vanish in the azure in the morning light, rosy with the dawn; those of the Madonna di San Sebastiano are illumined by the light that falls from the top of the cupola, and the robes of the saints gleam in rose and gold; the other angels in the «Night» are enveloped as in a flame which comes from the Holy Child, and is diffused and chases the darkness. While Dosso Dossi, the Ariosteque (in Ariosto's style) painter put strong enthusiasm and phosphorescent brilliancy into his fantastic forms, Correggio enveloped his in the most voluptuous twilight. He cast treasures on the earth *il pittor delle Grazie!*

At Venice, painting which, in the 14th century, had not had a development similar to that in other Italian cities, in the *Quattrocento* (15th century) was given a living impulse by Gentile da Fabriano, by Pisanello, and still more by the school of Squarcione, who was the founder of the greatest school of Lombardy. As on the head of Brunetto Latini there fell some leaves from the laurels of Dante, thus, through Squarcione, was projected the glory of his adopted son, Andrea Mantegna. The school of Squarcione became known everywhere. From Negraponte, an island in the Egæan; from Dalmatia, Parenzo in Istria, from the Venetian Lake, from the capital of the Estensi, from the learned Bologna flocked artists to this school. Above all the rest, like a giant, rose Mantegna. Mantua was the principal scene of his fame. He had in his soul and in his art the sentiment of Roman grandeur; this is expressed in its highest form in the Triumph of Cæsar, now at Hampton Court. The classic was his master, and the triumphal arches, the ancient ruins formed the scenes in which were displayed the Christian ceremonies; but he did not forget the strong, austere character of the Italians of the *Quattrocento*. As in his painting, so we see unrest in the bronze bust which he made in Saint Andrea of Mantua, passionate, rugged, the wreath of laurel made him look like the victorious leader of an adventurous army, terrible to his enemies, or like a conquering Perseus. But the sculptured, marble figures of Andrea Mantegna lacked the atmosphere with which they were surrounded by Giovanni, the son of Jacopo Bellini, who, with his brother, called Gentile, gave rise to the Venetian school. Giambellino, in his first works detached himself slightly from the Paduan or Mantegnesque forms. But, little by little, all that he touched took the color of gems, his shadows became transparent, his clouds floated luminously through the air, a visible harmony manifested itself all throughout his idyllic compositions. The knowledge of Mantegna became poetry in Giambellino. His madonnas rose sublime to reign over the earth, with the beautiful silver white drapery on their heads, with their opaline flesh tints, with the sweetest expression, seated on thrones of marble beneath cupolas made of golden mosaics.

A whole host of artists around Giambellino became intoxicated with color: Antonello da Messina and Carpaccio, Ciona da Conegliano and Boccacciero, Bartolomeo Montagna and Marescalo, Lorenzo Lotto and Giorgione. Coloring rivaled the splendor of the windows of Murano and of Oriental tissues: color sang! Giorgione began to put the crowning touch to the work of the *Quattrocento* (15th century) in Venetia; but, snatched from life, he left his task to Titian. He passed through life rapidly, like a splendid knight in gleaming armor conquering the kingdom of the beautiful. Born in 1477, he died at the age of 33 in the flower of life. The individuality of the artist was manifested in the realm of color, the femininity of the Virgin with the long oval face and with her thoughtful eyes veiled in shadow; in the Venus with the ivory who yields to slumber in her draperies of silvery white and red, whilst the light gleamed on her beautiful limbs and the green earth smiled, and the little clouds here and there floated in the sky. In all one finds the same seeking after nature in its varied landscape, the most delicate selection of all the minutiæ, the same noble style, the same luxuriant forms; a desire for air, light, nudity, beauty. The wisdom of Giorgione resembled that of Titian, the great master who bathed his canvasses in sunlight, made the blood course through the forms he depicted, and with colors produced live flesh tints. The doges of his Serenity, Varlo V., Filippo II., the Medici, the Gonzago, the Estensi, the Farnesi, and Aretino had their portaits painted by him, in which they are immortalized today; his daughter, Lavinia, superlatively beautiful, still bears witness to the love and pride of her father. When he died, the voices of joy were silenced, the splendor of the Venetian Republic was dimmed. And with the cessation of the festal chorus of the last representative of the art of painting transmitted by Giorgione to Titian, Tintoretto, appeared, heavy in coloring and in thought. It appears as though he had painted, at fever heat and in a sin-

gle day, his *chef-d'œuvre*, the Miracle of San Marco, so strong, full and resolute is the stroke of his brush. It seems as if a flame had darted from the sky and enveloped the earth; the flesh of his figures seems to be composed of gold, the very marble is illumined and reflects gold, the foliage of the autumnal trees takes under his hand tints of crimson. His colors are of flame; and his painting looks like waves of flame at the setting of the summer sun, at the decline of Italian art.

Italian sculpture takes the same direction. In the *Quattrocento* there were forerunners who rose spontaneously to the summit of the ideal, and they attained the highest eminence, and sculpture did not progress, as some have affirmed, outside of the sepulchre of classic antiquity, of patched up counterfeits and copies of the antique. New apostles of art traversed Italy, the Tuscan sculptors, and they conquered it with the strokes of their chisel. Now there were erected on the public squares monuments, par excellence, equestrian statues, now triumphal arches were built and the churches were transformed into temples of beauty. Florence, the new Athens, as with a winnowing fan enlarged the wealth, the civilization of her sister cities.

The *trecento* had carved the great periods of learning, of the highest mechanical arts, of the seven liberal arts, of the seven planets, of the seven sacraments, etc.; but the *Quattrocento* bore the palm in industrial progress. Zampo della Quercia even sculptured the virtues around the Gaia Fountain at Siena, but as noble matrons proud of their moral beauty. Learning left its traces on the *Quattrocento;* but the artists in representing this or that sky seemed to have lost their memory; they made and unmade freely, wove on a woof that was no longer the classic; committing to oblivion Marciano Cappella and Pendenzio, Cicero and Boetius, Saint Augustine and S. Francis of Aquinas. The representations of Old Testament scenes, after Ghioberti had depicted them in a gate of the Baptistry at Florence; Jacopo della Anucia in S. Petronio at Bologna; were no longer in the same rank, no longer bore the same relation to the Antique. It was found in painting—not so much in sculpture—that in the desire for monuments many scenes had to be omitted because they were not suitable. This tendency may also be noted in the scenes from the New Testament, limited to the scenes of the Passion of Our Lord.

Donatello was the greatest among the masters in his representations of the tragedy of the God-Man. There never was a more violent outburst of passion in art, never was the distinction between the antique and the modern more forcibly shown, the difference between classic serenity and Christian agitation. The concentration of the sculpture of the *Quattrocento,* which was shown in some of the most significant scenes in the life of Christ, demonstrates that sculpture lent itself rather to dramatic than to historical scenes, rather to the culmination of the events which had come down from the classic. Thus it was in the scenes of the life and of the legends of the saints, synthesizing, summing up in the chief essentials; demonstrating the scope of the unexpressed actions, allowing one to guess at their fulfilment, to rise to the original form. From the beginning of his activity Donatello affirmed those artistic aims set forth in St. John the Evangelist and the Moses of Michaelangelo, and creating the type of San Giovannino, who fed on honey and locusts. But, after Donatello, sculpture showed a tendency towards classic art, taking refuge in depicting martyrdom, tortures, and death; in everything, youth, calmness, sweetness, moral grandeur, civilized decency. In making the figures true to life the Virgin, previously represented as a mother playing with her infant son, or as a good housewife, becomes more mature; the infant Jesus becomes the little lord of the universe; the angels lose their infantile ingenuousness, and become graceful youths. All that with which *Quattrocento* had formerly clothed the figures—the kindly expression, the natural vivacity, the popular simplicity, was now withdrawn, because the idea of strength, of size, of Roman art, of sovereignty, was opposed to the pure ingenuous representation of the sacred forms. The contrast was established also between the pictorial elements that had come into the modern art and statuary. But only a genius like Michaelangelo could personify the national tendency to place art in unison with the great memorials of antiquity, to make it prominent, or to detach it, as in the foundation of the Thermæ, the Forums, and the Roman circuses.

It was natural that on Italian soil there should be a tendency towards a living type, and that art should obey the certain laws which rule things during certain periods, towards a progressive advance, augmentation, increase in size, a continual amplification of forms. But all through the 15th century, sculpture was not permeated with classicism, as was literature; it was animated by it when it was in accord with its character, it sought the antique as it came by degrees from the purest sources, it had the vision of ancient civilization as it became clearer from day to day. Arrived at the end of the *Cinquecento* and at its highest degree of development, it sought the grandeur of sculptured forms, the complex ingenuity of composition, the restless expression of emotion, and began to look at examples of art that had ripened elsewhere, and had been inspired by another civilization; but, before this, the assimilation of the antique had come by degrees, and the naturalism of art in the *Quattrocento* was the highway to the invasion of classicism.

The antique inspired Italian sculpture with artistic liberty, animated it with a love for the nude; but modern art, before modelling nude figures and giving them free action, first of all perfected the head, and gave the bust a place of honor. Not alone the features are represented in it, not alone the physiognomical traits, but the individual

character, the truth of life; and Michaelangelo omitted even the physiognomy, in order to represent the thought. The bust was a sign of the victory of individuality, but it did not fulfill the human desire to leave a remembrance of itself, to establish its love of fame. In the equestrian statues of Ferrara, Padua, Venice, monumental art found its highest expression in the *Quattrocento,* that art which is found in the gates of castles and palaces, veritable triumphal arches; in the mausoleums, transformed into mortuary chapels, veritable sacred spots; in the altars peopled with statues. Mistress of her tools, Italian sculpture of the *Quattrocento* answered to the multiple needs of the people and diffused itself throughout all the courts, and in the castles of France, in the Flemish guilds, in the palace of the Sultans, in the royal palace of Mattia Coromo, King of Hungary.

At the beginning of the *Quattrocento* Niccolo Lamberti di Arezzo in the door of the Mandorla of Santa Maria del Fiore rivaled with his metal mouldings the ancient vases of Aretino; Lorenzo Ghiberti applied the laws of painting to the door of the Baptistry and transformed the bassorelievi into so many pictures full of life. Meanwhile Luca della Robbia employed in painting only such colors as would give life to the chiaroscuro and revive the plastic effect. Simple, tender, most human, Luca della Robbia has not the high imagination of Ghiberti, nor the epic grandeur of Donatello; he placed amid vases of lilies, Mary, the fairest lily of earth; and with the sweet image he brought joy into the Tuscan life of the *Quattrocento.* But above all the Tuscan masters of this century towers Donatello, who translated into marble, bronze, plaster, Man, the whole of man, whether in the niches of Or San Michele he placed the bold knight St. George, the patron of the corporation of cuirasses, or arose in the Campanileo, rugged, wrathful prophets; whether he sculptured a dissolute dance of lads, or gave the supposed bust of Niccola da Uzzano the character of a tribune. Classicism conquered him for an instant after his second voyage to Rome; but life once more broke in upon the sacred history of Padua, in the harassing drama of the close of Christ's life in the parchments of San Lorenzo di Firenze.

Andrea di Cione, called *Il Verrocchio,* followed in the footsteps of Donatello, and rendered immortal, more than did his own exploits, Captain Bartolomeo Colleoni, who appeared, as a knight without reproach, to throw down the gauntlet to his enemy, under fire and the shots of catapults. Among the pupils of Donatello is known Agostino di Durcio, who, like a neo-attic sculptor, draped his figures in clouds of tissue and cloth, with garlands, spirals, curves. At the same period lived Desiderio da Settignano, who gave his marble a soft vagueness, which seemed to be attained with a feather and not with a chisel; and Mino, his disciple, who gave everything a facile, light character as though executed in wax or paste, and was, as Vasari said, more versed in the graces than in the fundamentals of art. Superior to Mino were Bernardo and Antonio Rossellino and Benedetto da Mariano. Contrasted with these is Pollainolo, who loved the strength that is evidenced on the muscles of the athlete. Their realism is shown in an unfeeling spirit of analysis and in the want of repose in the form of the larger extremities, of the knotty fingers, the iron tendons.

While Florence was laying the foundations of modern sculpture, Siena was doing the same in Jacopo della Quercia, who represented the return of art to the forms of its Etruscan ancestors. Free from all grossness in art, he died expecting his soul to be transformed into that of Michaelangelo by an artistic metempsychosis. Hercules was in the soul of the marbles of Michaelangelo, he slumbered beneath the white blocks of Luni and on awakening he cast far away from him the chips, like flakes of snow, that covered his powerful muscles. And behold! Moses arose with a look of hesitation, with lips on which resounded the tones of malediction. And behold the slaves of the museum of the Louvre, who shudder on awakening, their arms supporting the old world; and Lorenzo di Medici, the thoughtful (*Il Pensieroso*), beneath whose head passes the shadow of death's wing; and the «Night» (*La Notte*), who sleeps on the sepulchres of the Middle Age, not desiring the light. Michaelangelo is steeped in sadness; in his soul are projected the shadows of human sorrow, his heroes in the midst of their glory hear the wailing of humanity. He raises himself, however, above the things of earth and touches the heavenly; he exalts his divine sentiment and touches the mysteries of existence; he raises himself on human tragedy, and arrives at the sorrow of the universe. Michaelangelo is the huge limit of modern art, as the mountain which he himself carved was transformed into a giant which with its head mounting to the clouds at the summit sheds waves of light on the Tyrrhenian Sea. Michaelangelo was this giant on the summit of Italian art!

The other regions of Italy had not in sculpture the genius which combines in itself the multiple forces of production. At Venice the Tuscan masters had given the impulse to the formation of the new school.

The sculpture of Lombardy in the *Quattrocento* (15th century) is instanced particularly in the statues that adorn the Cathedral of Milan. It is recognized with less uncertainty in the second half of the 15th century, in the works left in the Carthusian monastery of Pavia by the brothers Mantegazza and by Amadeo and his followers. The *chef-d'œuvre* of the art of Lombardy of the *Quattrocento,* the work probably of one of the masters who decorated in terra cotta the cloisters of the Carthusian monastery of Pavia, is the Dance-of-the-Angels in the vaulted ceiling of the cupola of the Portinari chapel in Sant' Eustorzio at Milan. Agostino Busti, called *Il Bambaia,* was an exponent of all the characteristics of the Lombardy school of sculpture in the 15th centry, showing himself, however, insatiable in the adorn-

ment of his statues, and in the decoration on his monuments.

From Northern Italy the art of sculpture was introduced into Sicily by Pietro di Bondate, Francesco Laurana, and, above all, by Domenico Gazini, the master of a school that filled Sicily with statues until the *Cinquecento* had advanced. Antonello Gazini, architect and sculptor, was extraordinarily industrious and productive, and displayed ever the native grace, the continence of the *Quattrocento.*

Mantua in the *Quattrocento* gloried in Sperandio; Modena in Guido Mazzoni; Bologna showed signs of vitality after there came to her walls the brothers Dalle Masezze, Jacopo della Quercia, Niccolo dall' Arca di Bari, Sperandio, Andrea da Fissole, Francesco di Simone da Fiesole, and began to paint and attempted to represent the noble figures of Francia.

At the commencement of the *Cinquecento,* the differences in art in the various regions of Italy disappeared. Those masters who reflected the social life and sought the costumes of their contemporaries, the most minute characteristics, the individual verity, were superseded by those who represented traditional costumes, general forms, typical truth. To spontaneous art succeeded the art reflected by the artists inspired by the lyrical art of Raphael, or the epic grandeur of Michaelangelo, which from the Sistine Chapel dominates the century. A great national artistic unity began to take form, caused mainly by the predominance of classical antiquity in the new art. The pagan world which art revived represented submission, oppression, and inaugurated the Decadence; the word «*rinascita*» (rebirth) spoken by Vasari, who saw the salvation of the art of the *Cinquecento* in the initiation of classic antiquity, expresses for us the arrest of Italian artistic vitality. When this vitality was on the wane, art became a servile imitator, sacrificed itself on the altar of classicism. The geniuses (the last sons of the *Quattrocento*) having disappeared, formula was substituted for sincerity. Raphael seemed to be triumphant everywhere by being imitated by a host of artists; but his sweetness was not to be found in the frescoes of his imitators; it seemed as though Michaelangelo should dominate the world, but the statues of the acrobats who imitated him had not the strong breathing power of his athletes, nor the terribleness of his imagination. And thus, art, towards the middle of the 16th century, appeared to be almost without inspiration, the grandeur of massing was employed in order to produce astounding effects; one felt the chill of immense spaces, and attempted restlessly to enliven them with strong chiaroscuro effects, setting out to twist, contort, torture all forms. They invoked grace and found a grimace; they sought to clothe themselves in great magnificence, but succumbed under the weight; they endeavored to imitate the antique and made only a parody of it; in conventionality, truth was effaced, and imagination played no part; all this art, which did not follow nature, which was bowed down by the weight of reminiscences gnarled, wrinkled itself, swelled itself out savagely.

The neo-classicists of the *Cinquecento,* the Peruzzi, Antonio da Sangallo Junior, Sannicheli, Jacopo Sanseverino, built edifices with the antique solemnity. The old formulas of the ancient orders of architecture were not as yet rigidly observed; and architecture had still its appropriate colors. The Veronese, Palladio, alone, constituted a sort of Roman authority.

The *Seicento* (17th century), as if in reaction against the cold art of the mannerists of the end of the preceding century, chose the strong contrasts of light and shade, the delirium, the dizziness of the forms; and on account of this bewildering art, appealing to effect, to this magnifying of things, to this superabundance of material, the art of ancient times, the flower of civilization, was cast aside.

Even sculpture, under the followers of Michaelangelo in the *Cinquecento,* seemed to be exhausted. Emilia, however, had still the terra cotta frescoes of Antonio Begarelli; Venice was adorned with the works of Jacopo Tatti, called *Il Sansovino,* and with the busts of Alessandro Vittoria, who rendered in marble and plaster the portraits of Venetian noblemen, which rivaled the pictures of Titian and Tintoretto.

The painting of the *Cinquecento,* after the decline of the great generation that issued from its threshold, became from day to day more weak. Florence, after Fra Bartolomeo and Andrea del Sarto, triumphed no longer; Siena, after having had fresh glory from Sodoma, and from its Peruzzi, became insignificant; Parma lost its elegance after the death of Francesco Ferrara, and Mazzola, the two Dossi being exhausted, no longer had any splendor; Milan, on the disappearance of the followers of Leonardo, of Solario, of Luini, and of Gaudenzio Ferrari closed its school. Venice, which had been tardy in art development like other Italian cities, advanced more than did these in its triumphal career. The contemporaries of Titian, among them Palma Vecchio and Sebastiano del Piombo, Lorenzo Lotto, and Bordenone, continued the great Venetian traditions; Bonifacio, Paris Bordone, Moretto da Brescia, Paolo Veronese, Gian Battista Moroni, da Bassano, transmitted them to all the *Cinquecento* through their followers. At the end of the *Cinquecento,* at the time in which Florence appeared to have exhausted her strength; Venice no longer reflected the Oriental gayness of coloring; Bologna and Naples, which in the *Cinquecento* had had a poor artistic development, now dominated in their turn, the one with the eclectic school of Caracci, the other with the naturalistic forceful school of Michaelangelo, of Caravaggio.

The man who appeared to personify in himself all the art of the *Seicento,* the most versatile that Rome had seen since Michaelangelo, was Gio Lorenzo Bernini. In architecture he retained the monumental feeling; he glorified Michaelangelo unconditionally

as an architect, and despised Borromini, who, he said, instead of becoming inspired by the human form, lay down rules established on illusions. He considered round forms, or those described in a circle, as the most perfect, and particularly admired contrast, observing that things do not appear what they really are, but get their appearance from the surroundings. Bernini looked at architecture as if it were a thing similar to sculpture; and in architecture, as in sculpture, he saw with correct eyes. Bernini was the architect who founded modern Rome.

To sculpture, Bernini brought his pictorial knowledge; and his chisel passed over the drapery, over the flesh, the hair, changing power, the strong features, varying tone; sometimes he broke and rebroke in rage the plans of his figures; sometimes he spun hair soft, light and waving in the wind. The polishing of the marble sometimes made his figures flabby and baggy; his draperies swelled like willows in a tempest, lashed the figures and strangled them. Bernini, in everything seems like a coreographer who seeks to correct nature, which is too weak and contemptible for him, who desires to make it gigantic in order that it may impose, subjugate, and blast.

The return to the antique was the programme of the Carracci, who applied it in gathering the reminiscences of the great art that had flown, reuniting them in eclectic formula, not in a new harmonious potent form. The triumvirate, Annibale, Ludovico, and Agostino Carracci, created an Academy of Design, the first type of the Academies of Fine Arts. Annibale, endowed by nature more highly than the others, left in the gallery Farnese in Rome the most splendid example or decorative art of the *Seicento* (17th century). In the princely palaces of Italy, in the vast churches created by the Jesuits, the art of the Carracci penetrated, exalted God and men in a language full of emphasis, amid the fumes of incense, gaudy gold objects, the crowd agitated by the barocco statues. The efforts of the Carracci to impart dignity and vigor to the ancient tree of Italian art were not in vain; for instance, Guido Reni, who painted rapidly representations of Christ crowned with thorns, his eyes languishing in sorrow beneath his eyelids, as though his spirit was trying to return to the light; also Albani, the painter of cupids, of gallantry, or frail nymphs, of coquettish Graces; also Domenichino, a *Quattrocentist* astray in the *Seicento*, timid among his bold contemporaries, conscientious among so many that were careless and slovenly; and Guercino, who wrapped his compositions in gloom, and here and there enlivened them with rays of white light; and Lanfranco, who raised colossi on the arches and cupolas and the large wharfs!

Other eclectics, greater in technical force, painted at Naples under the influence of Caravaggio and Ribera; and one, the prince of modern Italian landscape painters, Salvator Rosa. Other eclectics at Genoa were: Bernardo Strozzi, a disciple of Caravaggio; and Benedetto Castiglione, a disciple of Van Dyck. This great painter influenced also a Sicilian master, Pietro Novelli, called *Il Monrealese*. Tuscany had other eclectics and more celebrated ones; the sweet Carlo Dolce, the antiquated Pietro Berrettini da Cortona.

At the dawn of the 18th century art decayed, became gayer, took on smaller and more cheerful proportions, twined itself like ivy, moved like a snail, turned into sketches, issued in spurts, poured itself forth in the cascades of Arcadia. Human figures lost their bones, and were released from the prison of enormous mantles of marbles in the midst of rocks and clouds, their hair flying in the wind, their arms in awkward and convulsed gesticulation. Then it was that classical antiquity attracted anew, like a siren for the modern artist. Benedetto XIV. outlawed from the throne the crusade for classicism; and Winckelman sounded the call to arms suddenly around the Greco-Roman *simulacri*. The antique entered brusquely into the midst of the crowd of *cicisbei*, advanced frowning gravely, severe, tyrannical amid the uproar of knaves. It was proper, then, that art, without high ideals, should turn to social life, renewing the affectations, but also collecting a treasure of observation and of truth in the hands of Leon Ghezzi, of the Loughi, etc., that erudition, philosophy, science came in to arrest art in its search for reality. The serious Menzo held in honor the principles of the Carracci; and Winckelman, with his idealistic enthusiasm for antique beauty, united all in admiration of the civilization which in Pompeii and Herculaneum arise like a phoenix from its ashes.

Decorative paintings in the *Settento* (18th century) had displayed its splendors in Venice through Gian Battista Tiepolo, Piazetta, and Sebastian Ricci; but in that century there was, in general, a kind of division in artistic work; some were landscape painters, among whom Zuccarelli, the Venetian, is admired; other, painters of ruins, of architectural compositions, the best of them being Giovan Paolo Pannini; others painted flowers and fruit, street scenes, and of these last Antonio Canali, Bernardo Belloto, and Francesco Guardi were unsurpassed.

In sculpture, Canova was a representative of his school even in its variations of tendency. In a relief in terra-cotta of the Seminary of Venice, the master shows himself still barocco; but after his youthful years all was changed to an assimilation to the antique. He had said to himself that it was necessary to look at "nature with the eyes of antiquity." But the blending of the antique with the new art was, until the end of the Setticento, the dream of scholars; to depict faces with profiles in which the forehead and the nose were in a straight line, the forehead brevis of Marziale, or tennis of Arazio, the forehead of the same length as the nose, and the rest of the face from the extremity of the nose to the end of the chin; to arrange the hair in a curve so as to make an oval of the face, to mark the fine eyebrows, to round the chin gracefully, etc., meant to construct the human body on

an algebraic formula. Hence there appeared expressionless faces, oval in shape with soft effeminate cheeks and the surface of the face rounded and smooth, with curls on the forehead, and carefully twisted tresses; but these heads did not breathe, they grew by artificial means in a hothouse, without the warmth of imagination, without the rose of life. Classic art is a fossil tree that can no longer delight men with its shade. Canova hoped that the trunk of this tree would once more become green; and full of impulse for classic beauty, he began one of the many return movements towards the antique, which, in Italy, originating in the classic field from time to time at every breath of civilization, were fatal. From time to time, in the Italian sea, the tide rises and flows to the antique shores, where there are no longer either sirens, tritons, nor nereids.

In vain do we attempt to construct new triumphal arches and basilicas and theatres on the Roman model; the opulence and the Roman sense of empire are lacking. The various parts of the edifice may have corresponding proportions, measurements, marked by square and compass according to the antique; but the whole result is mechanical, material, pallid, cold. All the ornamentation was *volute,* as in the Roman, but it had no color and fell into identical, stereotyped forms. Decorative painting of Appriani attempted to recall to life the grotesque figures of the Roman thermæ and of the houses of Pompeii; but they remained without meaning in their conventional elegance. All this art passed by like a comet which had obstructed the light of the sun, and left long trails in the wretched art productions of the 19th century.

The *Ottocento* (19th century) was the century of archæology. The art of the past was persistently recalled; but neither the Cincinnati nor the Coriolani created by the art of the kingdom of Italy; neither the knights and the ladies embellished by the Roman sky; nor the saints of the pre-Raphaelites with the heads in a frame of gold fastened to their dress can express the new life. Now art idolized classic beauty, now it contorted itself in the neo-gothic spears; now it had a mystic fervor; now it became concupiscent; sometimes it turned towards the graceful *Quattrocento,* sometimes toward the solemn *Cinquecento,* or the ponderous *Seicento,* or the unrestraining *Settento.* Thus, the art of the past century remained without unity, its aims undefined, and desired only technical progress; now gathering about the past as around a plank of safety, now taking refuge in navigating without a compass in the kingdom of dreams. But, having achieved technical progress, and persuaded now that counterfeits of the antique are of no value, having abandoned academic ecclesiasticism, and feeling the need of adapting themselves to the sentiment of the common people, Italian art is preparing to speak the final word.

ADOLFO VENTURI,
Professor of the History of Art, Royal University of Rome.

24. **Italy — The Natural and Physical Sciences in Italy.** Old and young at the same time, Italy combines with the traditions of a glorious past in the field of science and the arts, the untrammeled energy of an overflowing vitality in modern times. She boasts among her sons the genial Leonardo da Vinci (q. v.), eminent as an artist and philosopher, an engineer and a naturalist; and the immortal Galileo (q. v.), a martyr to truth and human progress. And if the former, prophetic and solitary on his intellectual heights, did not exercise a great influence on the development of science, it was the latter, on the other hand, from whom were derived those sciences which on account of their methods are called exact sciences, and who had followers at once in the Academy of Cimento which took as its motto the celebrated «Provando e Riprovando.» A member of this Academy was Borelli, who applied the laws of mechanics to the motions of animals; and Torricelli, a pupil of Galileo, who invented the barometer and demonstrated the impossibility of perpetual motion.

At the close of the 18th century and at the dawn of the 19th century in Italy we see Galvani, who in 1891 published his celebrated work, 'De Viribus Electricitatis in Motu Musculari;' and Volta, who interpreted the experiments of Galvani with a greater intelligence and gave rise to a new branch of physics, the application of which has contributed very largely, next to the application of steam, in transforming our civilization.

Contemporary with the two above mentioned was Spallanzani, who disclosed the secret of fecundation.

The works of the poet and naturalist, G. B. Brocchi, on the other hand, belong entirely to the 19th century. He shows us the geological structure of the Apennines, and in his works on paleontology unfolds ideas which to a certain extent anticipate the theories of Darwin. To the same period belong the researches of Count Amedeo Avogadro, who was the first to insist on the distinction between atoms and molecules, and who discovered the law that bears his name; also the ingenious experiments of Melloni, who, through the discovery that heat rays had the essential characteristics of light rays, made an important contribution to the theory of the unity of physical forces, which had also a valiant defender in Father Secchi. We must also mention Dal Negro, who in 1830 built the first electric motor. Towards the middle of the century, Corti published his 'Recherches sur l'organe d'ouie des mammifères,' in which he reveals the mechanism of the auditory organs, discovering the one that bears his name; Fusinieri, a thinker who has not been appreciated at his full value, put forth ideas that were strangely similar to the most modern theories on the constitution of matter; and Ascanio Sobrero, in 1847, made a preparation of nitro-glycerine, which only 15 years later was made an industrial manufacture by Alfred Nobel.

At the present day the scientific institutes and laboratories of the great universities, and even of not a few of the middle-class and smaller colleges constitute so many centres of research, which, aside from their value to the professors

of the special branches of science, furnish their assistants and collaborators and others (outside students), also the younger graduates of the universities, with their first equipment in the field of scientific research. The government observatory of the Collegio Romano (the old Jesuit college) at Rome; the observatory of the College of the Vatican; those of the Collegio di Brera at Milan, of Arcetri near Florence, of Genoa, Turin, Padua, Naples, Palermo and Catania, all of which, however, are not equipped with modern instruments, and others of minor importance, are zealously and earnestly devoted to the study of astronomy and celestial phenomena, as well as to meteorology and physical geography. In connection with these last two studies there are numerous allied institutes of which we will first mention the Central Bureau of Meteorology and Geo-dynamics, which was established by Pietro Tacchini and was under his direction for many years, and is now under the direction of L. Palazzo. This Bureau, besides making daily weather forecasts by aid of the regular observations of a vast chain of meteorological stations, gives incentive and impetus to allied scientific research. There are, besides the observatory of the Collegio Romano, which is connected with the above-mentioned Bureau of Meteorology, the Observatories of Rocca, di Papa; and of Vesuvius, established specially for the study of seismic and volcanic phenomena, the Observatories of Mount Cimone (2,160 metres above sea-level), of Mount Etna (2,950 metres) and of Monte Rosa (4,560 metres). By means of its meteorological bureau Italy has been able to join the international organization for the concerted universal study of seismic convulsions, and on the other hand the organization participates with the Italian Æronautic Society and the Military Æronautic Corps in international æronautic ascensions, from which meteorology derives the greatest benefit. There are similar institutes for botanical instruction and study, the first of which was founded in Italy in 1545.

Finally we will mention an institute which, thanks to the noble initiative and generosity of a stranger, arose on Italian soil, and is destined to pass entirely into the possession of Italy. We allude to the Zoological Institute at Naples, which was founded in 1870 by a German, Anton Dohrn, for the study of marine fauna and has become a model for similar institutes which have since been established at other seacoast towns. It is now being enlarged by the addition of another laboratory for the study of the physiology of marine animals.

In addition to the attention paid to scientific research in the universities and other institutes above mentioned, the scientific life of modern Italy displays itself in the Academies, which according to their statutes should gather in themselves whatever there may be of note in the intellectual ranks of the country, or of any of its provinces, and in the special Associations which, in return, seek for affiliation and exchange of ideas between students in the same branch of science. We will name among the Academies, some of which have already been in existence for a long time and are rich in glorious traditions and illustrious names, the Accademia dei Lincei in Rome, the Istituto Lombardo di Scienze e Lettére in Milan, the Istituto Veneto di Scienze, Lettére e Arti in Venice, the Academies of Turin, Naples and Bologna. Among the Scientific Associations we may mention Società Italiana di Scienze Naturali, the Società Geologica Italiana, the Società di Fisica, the Società Seismica, the Società degli Spettroscopisti, the Unione Zoologica, the Società per l'Entomologia, la Malacologia, etc. In addition to the transactions, memoirs and reports published by these Academies and Associations, scientific information is placed at our disposal by the publication of numerous technical journals, among which we may mention the *Annali di Matematica, pura ed applicata,* the *Gazzetta Chimica,* the *Archivio Zoologico,* the *Nuovo Giornale, Botanico,* the *Annali dell' Ufficio Centrale di Meteorologia e Geodinamica,* the *Rivista Italiana di Palcontologia.*

Passing now from institutions to men, from the work to the authors, and beginning according to ancient custom with astronomy, Italy of our own day gives us men who have acquired a merited celebrity even beyond the confines of their country and outside the circle of their co-laborers in the same path of science. Tempel, a native of Germany, who from 1875 until his death in 1889, was the director of the Observatory of Arcetri near Florence, was a keen observer and an unwearying discoverer of comets and of smaller planets. Father Secchi (1818-1878), who gained a world-wide reputation for the Astronomical Observatory of the Collegio Romano, of which he was the Director, devoted himself to the systematic study of the spectrum of the fixed stars, of which he made the first rational classification, based on the characteristics of their light rays. To Schiaparelli (b. 1835), the genial astronomer of the observatory of Brera, we owe the discovery of the relations between falling stars and comets, a lengthy series of exact studies relating to the planet Mars, of which he designed the first chart subsequent to the observations made by him during the planetary opposition of 1877-78, and finally, the establishment of the fact that Mercury and Venus in a manner analogous to what we know in regard to the moon, complete their revolution around the sun in the same time that it takes each of them to perform a complete revolution on its own axis. Tacchini (1838-1905), an unwearying organizer, took the initiative, or gave the impulse, in the establishing of scientific and astronomical societies. In his own personal studies solar physics predominated. He devoted himself to observing the most important solar eclipses of the year 1870, and later, and discovered the white protuberances in addition to the red protuberances already mentioned. In the same branch of science we have an accurate and efficient investigator in Riccò (b. 1844), who devoted his attention to terrestrial physics, and especially to the study of Mount Etna, in which field he was preceded by the two Gemmolaro and by Silvestri, and earned the name of biographer of the great Sicilian volcano.

The activity of Vesuvius, on the other hand, was observed and made the subject of study for many years by Palmieri (1807-1896). He was also one of the first to apply exact methods to the investigation of the phenomena of atmospheric electricity. And as this brings us into the domain of meteorology, we must mention Father Denza (1834-1894), an earnest worker and investigator, who made noteworthy improvement in the perfecting of meteorological instruments, and caused the establishment of regular observations in many mountain stations.

It is scarcely to be wondered at that in a country so frequently devastated by earthquakes as Italy, seismology should have found many earnest and efficient students. Among those who deserve first mention is De Rossi (1834-1898), although the tendency of his 'Meteorologia Endogena' to establish a connection between atmospheric and seismic phenomena cannot be said to be in conformity with the objective investigation of the facts. In the modern study of seismology, which pays minute attention to even the slightest movement of the earth's surface, the works and instruments of Agamennone, of Cancani and of Vicentini are of great value.

From volcanoes and seismology it is but a step to geology and paleontology, the fundamental principles of which were conceived, or at least instantly accepted, in Italy, where Leonardo da Vinci saw in some fossil the traces of animals and plants of former ages; where Brocchi, who may be called the father of modern geology, recognized the formation of the Apenines; and where Capellini (b. 1833) as early as 1861 developed his course of lectures on the basis of the Darwinian theory. Pilla (1805-1843) deserves mention as the precursor of many others in modern ideas; Meneghini (1811-1889) on account of his studies in Italian geology; Stoppani (1824-1891), the geologist of Northern Italy, who in his book 'Il bel paese' showed himself a master in the art of popularizing science; A. and E. Gismondi, as at the head of the Piedmontese school; Canavari for his 'Palaeontographica Italica.' In mineralogy we have Sansoni (1853-1895), the author of classical works on the crystalline forms of calcite; Bombicci (1833-1903), celebrated outside the domain of his special science as the inventor and strenuous upholder of the discharge of cannon as a preventive of hail; Viola crystallographer; and Artini, geologist.

Turning now to the exact sciences, in mathematics we find Betti, who taught mathematical physics at Pisa; Brioschi (1824-1897), who excelled in all branches of his science, and particularly in the theory of equations and determinants; Beltrami (1835-1900), who was remarkable for the clearness and elegance of his deductions; and Cremona (1830-1903), whose works in graphic statics and in projective geometry won him great fame. These were the masters of a host of students who to-day teach and advance their science throughout all Italy. In the present generation we have Dini, who teaches higher analysis; Bianchi, author of 'Lezioni di geometria differenziale;' D'Ovidio and Veronese, geometricians; Volterra, subtle mathematical physicist; Enriquez, a mathematician and philosopher.

In the domain of physics, the seed sown by the undying work of Volta was destined to bring forth fruit primarily in other lands, where Ohm discovered the law of the electric current, Ampère the electro-magnetism, and where Faraday explained induction and the laws of electrolysis. Nevertheless, in every age Italy has given precious contributions to physics. We need only mention Nobili, who constructed the first sensitive galvanometer, of which Melloni made use in his celebrated experiments on radiant heat; Dal Negro, inventor of the first electric motor; Mossotti (1791-1863), whose ideas on molecular force contained the germs of certain theories that were developed later by Faraday and Clausius; Matteucci (1811-1868), who conducted many researches on magnetism and on the phenomena of magnetism and induction. Felici (1819-1902), was a pupil of Matteucci, and his researches in electro-magnetic induction, which are admirable for their elegance and simplicity, furnished him with the subject-matter for a theory of induction which is a classic.

In modern times we name Blaserna, who established the first modern institute of physics in Italy; also Roiti, to whom we owe one of the first exact experiments determining the unity of electrical resistance; Pacinotti, who as a young man invented an apparatus that later, under the name of Gramme's Ring, became the characteristic part of dynamo-electric machines and of electric motors with continuous current; Battelli, unwearied investigator and unexcelled instructor. Foremost of all is Righi, a genial experimenter, who, in a series of prolonged researches into the electric discharges in gas, made many observations which anticipated the later discoveries of other investigators, and which have acquired added importance in the light of modern theories. By his studies on the subject of electric waves Righi completed the analogy already made evident by the classical experiments of Hertz, between these waves and the motion of light, and at the same time inspired the first experiments of Guglielmo Marconi. Marconi himself, to whose genial perception we owe wireless telegraphy, must be mentioned in this review; for his work, as well in its beginning as in the later phases of its development, constitutes a splendid application of scientific principles and discoveries, and is a shining proof of the practical value that may be obtained from even the most abstract researches. We must not omit from the list of physicists of the present day, Galileo Ferraris (1847-1897), although he was snatched from his scientific labors 10 years ago; for his work, through which originated the discovery of the rotary magnetic field, which has found extensive application in electric motors, is stamped with the imprint of modern ideas.

Chemistry, the sister science of physics, often finds herself face to face with problems which by their nature are related to both these sciences, or which necessitate the use of methods of study belonging to the domain of physics. Hence, there arose an intermediate branch of science, physical chemistry, in the beginning of which Italy also participated when Avogadro formulated his celebrated law which correlates the volume of different gases with the num-

ber of the molecules they contain. Cannizzaro, the Nestor of Italian chemistry of the present day, insisted on the exact distinction between atoms and molecules, which was due likewise to Avogadro. In order to determine the molecular weight of composite substances, Cannizzaro made use for the first time of the density of their vapors. The recent progress in physical chemistry, which was inaugurated some decades ago by the study of dilute solutions, and by the application of the principles of thermo-dynamics in the investigation of certain problems in chemistry, was greatly aided by the contributions of Italy in the labors of Paternò and his pupils, and of the schools of Ciamician and Nasini. Cannizzaro's researches on the subject of alcohols are also notable. The labors in organic chemistry of Ciamician, excellent as a teacher, are also celebrated, as well as his studies, carried on in association with Silber, on certain chemical actions of light. Nasini is another brilliant teacher, who has recently made a study of the gases and radio-active emanations of the thermal springs and baths of Italy. Finally, in the domains where chemistry is auxiliary to other sciences we must mention Selmi, who discovered the ptomaines, and Guareschi, who contributed greatly to legal chemistry.

Among modern zoologists Italy can boast of Grassi, who discovered the secret of the propagation and metamorphosis of the eel, and by means of his celebrated researches, carried on in association with Bignami and Bastianelli, established beyond a doubt the fact that mosquitoes, and especially the Anopheles claviger, or large mosquito, are the agents in the diffusion of the parasite of malaria. These researches opened a way by means of which successful attempts have been made to fight malarial infection (and other diseases that are transmitted in like manner), whether by taking timely precautions against the sting of these insects, or by extirpating the insects themselves by drying up the marshes in which their larvæ abound. Another eminent zoologist, Emery, author of an able manual of his science, has also acquired deserved fame through his monograph on the Fierasfer, and he is equally well known for his exact and diligent studies in the ant world.

In botany, Italy has given us Malpighi (1628-1694), who was the first to discover the mechanism of nutrition in plants, and the relative function of foliage. In modern times we have Delpino (1833-1905), an eminently scientific mind and the inaugurator of vegetable biology, which from 1867 he has dissociated from physiology. It is he who by systematic research established the functions of animals, and of the atmospheric factors in the biology of flowers, and who classified plants with exactness, according to the manner of their fecundation. In the past and in the present generation we may mention Parlatore and Carnel, horticulturists; Saccardo, the mycologist, to whom we owe the 'Sylloge fungorum omnium;' and Pirotta, author of a vegetable physiology.

This cursory review of the condition of the sciences in Italy does not pretend to be exhaustive. In the midst of the activities and feverish life of a great nation it is difficult enough, if not impossible, to distinguish all the ideas that contain in themselves the germ of future progress, and the calm and impartial observer would find himself at a disadvantage if he should try to classify all intellects and weigh all merits. Instead of being a finished picture which is placed before the reader, this is only a rough sketch—a sketch, however, which while not defining particulars, should give a lively and clear impression of the essential characteristics of the object represented. And, thus, this sketch is intended to indicate whatever there is of enduring excellence or is characteristic in the scientific life of modern Italy.

B. DESSAU,

Professor of Physics in the University of Perugia.

25. Italy—Italian Music. The death of Giuseppe Verdi, without a doubt, signalized with the ruthless fact of the inevitable, the termination of the most typical and most glorious epoch of Italian music. From this point of view the date of 27 Jan. 1901, is full of historical importance. With it closes definitely the heroic age of Italian national music, of that art which, particularly in the works of G. Rossini, V. Bellini, G. Domizetti, and of G. Verdi, irradiated the world. At the death of Verdi all understood that the legendary age of Italian opera had come to a close forever, and that now it would behoove us to deal in realities. To the heroes, succeeded simple mortals; to the rule of genius, that of technique. What we lost in sublimity, we attempted to gain in profundity; compensation was sought for lack of clearness in the design by brilliancy of coloring; for the loss of melodious verse, by the intensity of psychological meaning; and local color took the place of passional intensity.

Yet this new art preserved intact some precious characteristics of the Italian race, this art which, while struggling nobly in the midst of surroundings that became each day more refractory and utilitarian, still succeeded in making its influence felt at home and abroad, leaving always a genial impression, and Italian national pride has no reason to be ashamed of it. It is, in fact, an indication of our constant progress in musical culture, which to-day shows a tendency to reorganize itself on broad and healthy lines.

We shall now see how the way was prepared for the actual musical movement, how and when it was outlined, assuming definite characteristics, and what were its successive vicissitudes up to the present time.

Giuseppe Verdi as long as he lived was at the head of Italian musical evolution. Alfredo Catalani, Amilene Ponchielli and Arrigo Boito were ancient and authoritative pioneers.

Arrigo Boito, with the aristocratic and complex temperament of a poet and a musician, writing for Ponchielli the libretto of 'Gioconda,' and for Verdi the two splendid libretti 'Othello' and 'Falstaff,' collaborated efficiently in the renaissance of Italian lyric drama. But his most direct and decisive action was in the composition of the score and the libretto of that 'Mefistofele,' which was given in Milan in 1868, and revived in Bologna in 1875. A happy union of classicism and modernity, 'Mefis-

tofele,' together with the last *chef-d'-œuvres* of Verdi had truly a great awakening power.

With his vocal scores, Ponchielli, especially in his 'Gioconda,' divested of obsolete conventionalism and animated by frank human passion prepared the way for modern realistic melodrama; while Catalani, of the delicately elegaic inspiration, with the Lorely and the Wally, devoted himself by preference to Wagnerian ideals. There are not wanting, then, notable composers. However, the inventive faculty of Italian musicians which appeared for so long to have slumbered in idleness did not awaken until 15 years later in 'Cavalleria Rusticana,' by Mascagni, whose marvellous success was the commencement of a new school, and of a new dawn of art. In the fever of novelty and of modernity at any cost, this music gave evidence of the haste with which it had been created, as though it would recover the time that had been lost. With some exceptions it almost always showed the spasmodic effort to attain half results, rather than the serene joy of one who has achieved the fullness of completion. However, many of those works exercised at the time a fascination and continue to do so. Bearing the imprint of a broad modernity they have a happy relation to the indistinct needs of our souls; and if, in their bearing on art and artists they represent only a halfway house on the wearisome road, to the public they may well mean the revival of opera. Such was certainly 'Cavalleria Rusticana,' in spite of some inequality of style in this melodic flow so limpid and spontaneous, that characterizes it from beginning to end, but especially in the freedom of movement and the freshness of impressions which were to make of these short scenes of Sicilian life the basis of the new musical trend.

After the triumph of 'Cavalleria Rusticana' nothing but realistic melodrama had any success in Italy. The madness of *Carmen* and the plunging of the dagger of *Don Jose* evolved on æsthetic canons of the powerful and elegant art of Giorgio Bozet, had already prepared a propitious soil. The love song of Turiddu and the slash of the knife of Compare Alfio did the rest. And here we have the realistic opera with Southern setting invading Italian ground, and the gentlemen with cape and sword retiring in good order before the heroes of Malavita, of M. Giordana, before the oyster venders of A. *Santa Lucia* of Maestro Lasca, before the Camorrists of *A basso porto*, of Maestro Spinelli.

Meanwhile Maestro Leoncavallo, following implicitly the word realism, gained a wide and well deserved reputation with his 'Pagliacci,' while the Maestro Cilea with 'l'Arlesiana,' and Gaetano Luporino with 'Dispetti Amorosi' and the 'Collana di Pasqua' were well received, as they also followed the prevailing artistic tendency. It was not thus with Giacomo Puccini, who was already known before Mascagni by his 'Villi' and his 'Edgar' of romantic fanciful order. Following these with 'Manon,' with the exceedingly popular 'Bohème' (his masterpiece), with the tragic 'Tosca' and the exotic 'Madame Butterfly,' he accomplished a gradual evolution towards more realistic forms, while maintaining in his art a subtle passionate fragrance that betrays its far away romantic origin.

We must not suppose, however, that all the younger maestri followed exactly in the steps of Mascagni, Puccini, and Leoncavallo. Each of them studied to invent something new, but in his own manner and according to his own ideas. Thus Alberto Franchetti, in his 'Asrael,' showed himself from the first to be a romanticist of the romanticists, enamored of Wagner and of the German school to which he belonged by virtue of the exact and profound study he had carried on in Germany. 'Asrael,' a splendid example of polyphonic technique, and remarkable for its brilliant orchestration, gives the gauge of Franchetti's talent, that loves grandeur rather than simplicity, and places him readily in the foremost rank. In truth, Franchetti, together with Mascagni and Puccini, completes the famous triumvirate of younger maestri, who for some years have been the sole representatives of the most modern musical school.

But others, and not a few, may be added to those already mentioned, and they must be noticed here to complete the character of this first period, full of activity and illusions. Among the works that deserve special mention are 'Hero and Leander,' by Luigi Mancinelli; 'Lorenza,' by Mascheroni; 'Maruzza' and 'Colonia libera,' by Floridia; 'Christ at the Feast of Purim,' the remarkable philosophico-social drama by Giovanni Bovio, set to music by Maestro Giannetti; and besides these, 'La Pellegrina,' by Clementi; 'Ratcliff,' by Pizzi; 'Savitri,' by the Maestro Conti; 'Desta a Marina,' by Coronaro; 'Celeste,' 'Gringoire' and 'Cortigiana,' by Scontrino, and many others upon whom the attention of the public has been centred, but only in fleeting fashion.

Considered as a whole, this first period of the modern movement in music had, therefore, a prevailing characteristic of realism, as is shown in the selection of subjects, and in the form of the libretto. All of which does not prevent this predominant school with the Bizetian (Bizet) characteristics from being met in the field by an almost contemporaneous school with Wagnerian proclivities, represented by Franchetti, Canti, Mancinelli, and a few others. It was natural that the two schools should mutually exercise an influence on each other, and thus it happened that with reciprocal advantage the external differences in subject-matter and form finally disappeared and we come to a second period which represents the fusion of the two schools. A new programme seems to have been substituted for the ultra-realistic, and ultra-romantic order which had served their time, and the new programme had a higher conception of dramatic environment and of a technique on a broader basis. The first honors in the bringing about of this evolution belong again to Mascagni, Puccini, and Franchetti. Already in 'Amico Fritz' and even more in 'Ratcliff'—a profound artistic conception—Mascagni knew how to inspire crude realism with a breath of sublime poetry. And if Rentzau, Silvano, and Zanetto had caused a halt in his upward career, 'Iris' came just in time to reawaken the former confidence of the public. The dramatic action of 'Iris' is a curious and strange blending of the real and the fantastic; but Mascagni's inspiration gave it new treas-

ures of harmony and orchestration, which made this opera the worthy rival of 'Cavalleria Rusticana.' Puccini met with similar favor in his 'Tosca,' with its gloomy and violent coloring, but strongly passionate style. Franchetti, after creating in 'Asrael' and 'Cristoforo Colombo' splendid fantastic and historical pictures, attempted with a happy touch to portray modern epic sentiment in 'Germania.' Leoncavallo, after making in his 'Medici' an incursion into the field of the great historical drama, and then coming back to realism in his 'Bohème,' gave us in 'Zaza' the modern passional opera on intimate social lines. Meanwhile in 'Chenier' and 'Fedora' a new and strong temperament in opera was revealed in the Maestro Giordano, who, in these much praised works showed himself to possess the theatrical vision. Finally, the Maestro Cilea in 'Adrienne Lecouvreur' succeeded in captivating completely the attention of the public.

Taken altogether, the productions of this period are found to be better constructed and more balanced than those of the preceding period. The almost excessive seeking for direct scenic effect, which was the evident outcome of the choice of highly sensational subjects was now largely replaced by a greater nobility in style. However, we are not considering a sporadic condition of our lyric drama, but actual characteristics common to all composers and which became more markedly evident in the third and more recent period of our operatic activity.

The success of Cordara's lyric mystery, 'La tentazione di Gesu,' founded on the verses of the illustrious poet Arturo Graf, was a significant sign of the new aspirations.

Another worthy musician, Giacomo Orefice, already known by his 'Gladiatore' and his 'Cecilia,' acquired a deserved fame by his 'Chopin,' in which, with the able help of the poet Angiolo Orvieto, he cleverly portrayed the life and music of the great Polish musician in a lyrical drama; and this fame was increased by his 'Moses,' with its mystically grand, eloquent phraseology and its exalted style. The present output is full of the high conceptions and an effort to develop a more marked national character. This character of nationality is a question of life or death. On it depends whether Italian opera shall be able to reaffirm its traditional preëminence in the face of the tremendous competition of the schools of other countries.

Besides opera, which in music is our most typical form and the most complete of our musical activity, there are also other kinds of music in which the Italians have taken honors. Among these is oratorio.

This form of art, which is, as it were, an imaginary bridge connecting sacred and secular music, is of purely Italian origin. But while it developed most markedly outside of Italy under Bach and Handel, it became popular in Italy towards the end of the 17th century, in a long period of decadence which lasted to our day. To the Abbot Perosi belongs the honor of recalling this noble order of music to new life. The oratorios of Perosi are in fact a happy grafting of dramatic sentiment and improved modern technique on the ancient and glorious stock of Palestrinian traditions. They awaken in the popular mind a deep echo which appeared to be dying out, and their great success inaugurates a true and important evolution in oratorical construction, which had worthy exponents in Maestro Tebaldini, Padre Ambrogio, and Maestro Sonzogno. Oratorio had also a conscientious historian in the young and learned Abbé Pasquetti, author of a book on 'Musical Oratorio' in Italy.

As of oratorio, so also of real and regular sacred music there is much to say. In publishing his famous *Motu proprio sulla musica sacra*, Pius X. laid down minute rules not only for the execution, but also the composition of church music, which he desired to bring back to its ancient purity. Among the most severely censured writers of sacred music are Bossi, Gallignani, Tebaldini, Terrabugio, and others.

It is unpleasant for an Italian to have to acknowledge that Italian symphonists receive little encouragement. Italy certainly has not the glorious symphonic traditions of which Germany can boast. Nevertheless she has acquired some fame, through Bolzoni, Celega, Scontrino in his 'Sinfonia Marinaresca,' and above all through Giovanni Sgambati and Giuseppe Martucci, the present Director of the National Conservatory of Naples, in his highly valued symphonies in «D» and in «F» major.

Also in instrumental chamber music, Sgambati and Martucci have made themselves conspicuous. In this field Italian production is unable to compete with foreigners. However, artistic qualities may be found in the works of Bossi, Buonamici, Adolfo Crescentini, Frugatta, Del Valle, Faini, Enrico Oswald, and in three interesting quartettes by A. Scontrini. Among the most recent works those of Zanella, Tarenghi, and Brogi deserve praise.

Vocal Chamber Music has not with us taken on the classical character possessed by the *lieder* (songs) of Schumann and Schubert in Germany; it deals exclusively with ballads, and the ballads of Tosti, Rotoli, Denza, M. Costa, and E. De Leva are universally known.

The great popularity of Italian singers in other countries obviates the need of mentioning names. There is almost always a wealth of good voices in Italy and there will never be lacking of those who understand the delicate mechanism of the Italian *Bel Canto*.

The schools of stringed instruments of Milan, Turin, Rome, Naples, Pesaro, and Parma enjoy a merited renown, and in general, the musical conservatories of these cities graduate a large number of the finest instrumentalists. But Italian musical instruction is not up to modern standards. And a proof of this is the fact that almost all our best concertists (orchestra players) have studied, or perfected themselves in Belgium or Germany. Besides her orchestra players and her singers Italy boasts of a great number of orchestra leaders of renown, such as Mancinelli, Martucci, and Toscanini, and the Maestri Mugnone, Usiglio, Ferraris, and many others.

Then in the field of musical literature there are writers of genius and intelligence, as Nappi, Depanis, Franchi-Vernecq, Pozza, Checchi, and Monaldi.

In spite of its partial disorganization and consequent scattering of energy, Italian musical

art has proved its inexhaustible vitality, and its admirable faculty of adapting itself to the new age. But the instruction now given in conservatories should be made more practical and more modern; care and intelligence should be given to the reorganization of Italian musical life, which from the theatre to the concert hall is in a condition of uncertainty and continual crises; and above all, Italian musicians need to give serious thought to impressing on all their musical productions a more vigorous and more sincere Italian character. CARLO CORDARA,

Musical Critic of «Marzocco.» Composer of Operas, Symphonies and Oratorios.

26. Italy—Economic Conditions. The fundamental traits of the modern economic conditions are similar in the principal countries of Europe and America. Wherever the returns from property are distinct from the returns from labor, wherever simple accumulation is the source of industrial remuneration; the more numerous class of laborers and persons in the employ of others are recompensed with wages, for the most part not commensurate with the productivity of the enterprise. In recent times wages have shown a tendency to rise to a greater or lesser degree above the amount required for bare physical subsistence; and the conditions of workmen have improved also in function of the growth and vigor of their unions and organized insistence on more liberal compensation.

But if the general laws of distribution are uniform, the actual distribution varies in different countries; because of the diversity in the primary economic conditions of the various classes; by reason of the number and relative importance of the fractional parts into which the proprietary class is divided; because of the degree of density of the population, and other causes; all of which exercise a greater or lesser degree of influence on the entire social system. Hence, the economics of each nation have their special peculiarities resulting from their specific conditions. In considering these conditions as they exist in Italy, we must remember that as an organized political unit Italy has had less than half a century of existence, whilst as regards the degree of cultivation of the land and country, she is economically ancient. But not until political unity had been obtained was there any considerable development of capital and an increase of industries in the various parts of Italy. The constitution of the new kingdom, therefore, marks an essential moment in Italian economic history. The accomplishment of political unity which is the brilliant triumph of the past generation has also given a special direction to public finances, which ought to be subordinated to the particular needs of the new collective organization, and in harmony rather with the principle of productive taxation, than with that of rates chosen in proportion to the individual revenues and wealth. In addition to this the new state assumed the debts and the deficit of the ex-states, who transmitted to her an onerous burden, about 2,250,000,000 lire of public debt, besides 100,000,000 lire of deficit.* The excess of expenditure was augmented by the expenses of war and of civil renovation, as the consolidated debt continued to increase largely, and the taxes by degrees made greater and more absolute demands on the wealth of the taxpayers. A persistent fight was instituted against the deficit which, from 700,000,000 lire in 1866 decreased to less than 150,000,000 lire, and except for a rise in 1870 began sensibly to decline, and in 1875 became transformed into surplus. Trusting too much to the natural increment of revenue and the permanent efficacy of transitory expedients, the government agreed to a disproportionate amount of expenditure, and thus, after 10 years, a troublesome period occurred similar to the first, and in order to steer through this the government was obliged to practise the greatest economy, to increase the rate of many taxes, to introduce fresh taxes, to prohibit in the future recourse to the consolidated debt.

This severe political action not only tended to reëstablish the equilibrium of the budget, and to the making of advantageous and continuous surplus after 1896-97, but served to give a stability to the Italian budget that richer nations may envy. In 1902-03, the budget showed a realized surplus of 99,000,000 lire; in 1904-05, of above 47,000,000, although an extraordinary but productive expenditure had to be met with the ordinary income. The prices of Italian public stocks in the last few years were maintained above par, so that on 29 June, 1906, the government could put into force the law whereby the 5 per cent. gross and 4 per cent. net obligations for an entire sum of more than 8,000,000,000 of capital were converted into obligations bearing only 3.75 per cent. interest and automatically transformable after 15 years into 3.50 per cent., thereby causing a saving to the government of many millions in interest charges. Banking conditions have also improved notably, doubtless because in conformity with the provisions of the law of 1894, the reserve funds have increased, whilst the industrial and commercial expansion produced a greater demand for bills of credit, so that agio was done away with, although as yet conversion at sight into metallic money has not been attained.

These facts are quite remarkable, but one must not infer only from the financial prosperity of the government and the sound state banking circulation that the condition of national economics is absolutely vigorous. Taxation in Italy is very heavy; its total perhaps equals one-fifth of the annual production, and although the system of public revenue is complete in the sense that it reaches all the direct and indirect sources of individual economics, it is defective as regards elasticity, coördination, and is too burdensome upon the most necessary articles of consumption. While the land and house taxes have the character of a real tax, that on the income (ricchezzi mobile) is personal, and may relate to profits, interest, honorariums, stipends, salaries, but which, by its character of a partial tax, hardly serves as an offset to the severity of the first two taxes. Permanent incomes are taxed at a higher rate than temporary or uncertain incomes; the exemptions are few and the mini-

*An Italian lira is equal to a little less than 20 cents.

mum of exemption is low. Another 200,000,000 lire is obtained from a class of imposts called taxes on business, but the general opinion at present is that they should be reformed as to their acceptation, as annoyances are caused by their collection. Modern progress was only evidenced in 1902 in the taxes on succession, and this is the laudable initiative to a better distribution of the taxation. But it is to be deplored that the food and home of the workingman should be so heavily burdened with imposts. A diminution of the rate of taxation would probably lead to a rapid increase of fiscal revenue, through the expansion of consumption, as occurred recently after the reduction of the duty on Brazilian coffee. But although it would be a benefit to finance and economics, it is not given any consideration on account of commercial policy. The duty on grain is 7.50 the quintal, and if it yields the state a variable, though always a considerable revenue, it places on the taxpayers the heavy burden of about 200,000,000 lire. Added to this pernicious distribution of wealth, owing to the duty, there has been no advance in the cultivation of cereals, and now the average yield of 10 or 11 hictoliters per acre is still small. Taken altogether, agricultural products are on the increase; unproductive land is becoming scarce. An estimate, allowing a wide margin of approximation, in 1896-98 gave a total of gross agricultural products of about 2,751,000,000 of Italian lire, to which must be added 90,000,000 lire for the forest land, and 1,500,000,000 lire for cattle; amounts that perhaps those who are informed will consider less than the reality as regards the amount of savings and the number of the agricultural population, which, considering the inhabitants employed in other occupations, amounts to 40 per cent. of the whole, while 19 per cent. are employed in manufacturing industries, and 4¾ per cent. in commerce.

Although the agricultural protectionism was counterbalanced by the industrial protectionism which developed after 1887 and was followed by a period of depression, there may be seen a noteworthy progress in the principal lines of production. The value of fuel for industrial use has increased, the power of steam engines and other motors, among which hydraulic and electric motors take the lead, increases in proportion to the increasing requirements of labor. The production of silk has grown remarkably, especially in the last 10 years, so has the cotton crop, especially the inferior grades; great perfection has been attained in the tanning of leather; and there has been a great increase in the chemical industries.

The bulk of international commerce, which, in the two years of 1890 and 1891 was represented by an average value of 2,100,000,000 lire a year, increased in the two years 1904-05, to an average of 3,649,000,000 lire a year. A small portion of this increase may be attributed to variations in price, and since then we cannot say that there has been any diminution in internal commerce. The indications are significant, and besides, agree with so many others that we may draw conclusions, for example, as to the increase in railroads, postal business, telegraphs, deposits in banks and savings banks, etc. But it is certain that the bulk of Italian foreign commerce is small compared with the foreign commerce of England, France, or Germany.

An industrial increase may be noticed; but the greater part of these factories are of small production. The average number of employes or operatives in each factory rose to 25 in 1876 and 38 in 1903, allowing naturally for differences in the different branches according to the relative technical requirements.

There are few large fortunes in Italy. Nitti made a calculation that there are from 1,500 to 1,600 millionaires; while in Germany there are about 11,000; in France, 15,000; and more than 30,000 in England. Every year minor inheritances of about 2,000 lire compose more than three-fourths of the total number; and those not exceeding 50,000 lire 98 per cent. The general wealth of 54,000,000,000 lire in 1885-90 rose to 65,000,000,000 lire in 1902-03.

In regard to the conditions of the laboring classes, the Bureau of Statistics has shown that in 1871 the wage per hour on an average might be estimated at 0.171 lire and in 1903 at 0.265. Taking into account the price of grain it would have taken a laborer 183 hours of toil during the first period to enable him to buy a quintal of grain; and during the second period, only 91 hours. According to the researches of Signori Geisser e Magrini, the average increase in actual wages in the usual industries was from 86 per cent. in 1862, to 192 in 1903, an increase, therefore, of 123 per cent. The variations, however, are many; and if we maintain that to-day the expert operative commands wages as high as 7 to 8 lire a day, the condition of the inferior workmen is a sad one, especially those that are not organized and who belong to domestic service. According to a census of workmen taken by the Umantaria at Milan, out of more than 122,397 persons who on 1 July, 1903, complained of their wages, 62,201 or 71.45 per cent. of the operatives received a wage of one to three lire a day, and out of these 41,389 operatives, equal to 91.31 per cent., less than one to one and one-half lire. In agricultural labor the wages were ascertained in 1901; the average wages, except for temporary increases, are even less than in the industries mentioned, and are reduced, according as there is a lack of work, which so often happens in Italy particularly with agricultural labor.

The increasing emigration, which comprises for the most part agricultural laborers, must not be looked upon as an indication of absolute poverty, but is rather a symptom of the difference between Italian and foreign wages. It has to a certain extent aided in eliminating the enormous excess of births over deaths, and has promoted savings which go to augment the national capitalization; it has also helped to establish certain forms of agricultural contracts, but it certainly has deprived Italian industry of valuable energy and changed the special demographic constitution of some of the southern countries.

The social legislation makes provision almost exclusively for disabled workmen (pensions for the old and infirm, and for extraordinary emergencies obligatory insurance against

the accidents incident to labor), while they hardly make any provision for well workmen, nor even for women and children. In regard to this class of workers more extensive provisions have been made to prevent the employment of young children and to shorten the hours of labor; but the inspection is not sufficiently rigorous, so that the legal regulations are almost systematically violated. However, a course of instructive studies was instituted by the Labor Bureau (1904) and there began to be a more rigorous application of the protective laws, which is always more readily brought about by the solid organization of the labor federations. If strikes are still of frequent occurrence, there are not lacking instances of a peaceful settlement of the disputes between employers and employes and the arrangement of mutual contracts.

It is certain that the progress in industrial civilization and the production of wealth is greater in Northern Italy than in the central and southern provinces, which is probably owing to intellectual and moral causes. There is less illiteracy in the northern provinces than in the general average of the kingdom or in the southern provinces. While in the province of Turin 86.25 per cent. of the population above six years of age knows how to read, in the province of Cosenza—which represents the highest degree of illiteracy—only 20.82 per cent. can read. And as to the criminality, in Sicily and Sardinia the crime of homicide attains its highest figure, more than double that of the rest of the kingdom, and is very frequent in Campania and Calabria; while in Lombardy and Venetia it is at about the same rate as in the most progressive countries of Europe—2.55 and 2.62 in 100,000 of the population in Venetia and Lombardy, and 29.11 in Sicily, in 1902. But between 1880 and 1889 statistics showed a decrease of 30 per cent. in homicides in Calabria and Campania; and in the southern provinces, more open to traffic and changes, the proportion of the decrease is greater than in the northern provinces; thus it is 12.91 in 100,000 in the province of Bari and 9.3 in that of Lecce.

From the fragmentary notes here given, it may be seen that in Italy wealth and capital, although small compared with that of the more important countries of Europe and America, has greatly developed; that industry has made remarkable progress, more in some regions than in others. Also the wages of the laboring classes, while inferior to those of workmen in other countries more advanced in civilization, have nevertheless almost doubled in 30 years, although this amelioration does not extend to all branches of the working class. Social legislation is always very incomplete, but even here there is more than a beginning of building up and more effectual application of the law. It is only by degrees that the labor unions are including less skilled workmen and women workers, and that legislative provisions will be made for the rank and file of laborers from which the whole class of operatives will also derive an ulterior benefit.

AUGUSTO GRAZIANI,
Professor of Political Economy, Royal University of Naples; Honorary Professor, University of Siena.

27. **Italy — Agriculture.** *Horography.* — Italy, by reason of its geographical situation, although in the Temperate Zone, gives us a synthesis of the vegetation of Europe. Next to Switzerland it is the most mountainous country in Europe. Two-thirds of its surface, comprising 288,588 square kilometres,* are covered by the mountain chain of the Alps (6,000,000 hectares), and by the Apennines (11,500,000 hectares*); and of these two-thirds, 56,000 square kilometres are unproductive of any vegetation, from natural causes. The remaining portion is only partially cultivated, and is only fairly productive in certain portions.

Italy contains the great plain of the basin of the Po, which covers an extent of more than 4,000,000 hectares, and the smaller plains which extend along the Mediterranean, in the Pisan, Grossetan, Roman, and Campanian territory; along the Adriatic in the tableland of Apulia (1,300,000 hectares); and also along the Calabrian, Sicilian and Sardinian sea coast, where they are smaller.

Climatology.—Sicily and Lower Italy, as regards the rainfall, have an absolutely littoral climate, with a minimum of rain in summer, and a maximum in winter. The valley of the Po, on the contrary, has an inland climate with two maximums of rain, in spring and in autumn, and two minimums, in summer and in winter. Central Italy has an uncertain climate, but resembles more that of the sea coast, with a maximum of rain in November and a minimum in July. On the Mediterranean slopes the rainfall is much greater than on the Adriatic side. In the Continental portion of Italy, the climate is much colder in winter, and much warmer in summer. The peninsula portion is warmer in the central part, because the climate is tempered by the vicinity of the Mediterranean, which does not, however, temper the heat of summer. The insular portion has a warm, invariable, dry climate, although with a high degree of absolute humidity; it is serene, has little rain, and is intensely dry in summer.

Hailstorms are most frequent in the Alpine Zone, extending to the foot of the Rhetian Alps, the Carinthian and the Julian Alps; and in a Tyrrhenian belt extending from the Arno to Calabria; and less frequent in a Paduan belt beginning at the Maritime Alps, the Cotian Graie and Pennine Alps, and extending to the east as far as the mouths of the Po; and in an Adriatic belt which extends from the marches to the Salentine peninsula and to Sicily.

Agricultural Regions.—The agricultural regions of Italy may be divided into five: (1) The acid fruit region; (2) the olive regions; (3) the vine-growing region; (4) the chesnut region; (5) the forest region, which it is hard to define exactly.

Agriculture presents itself under the most different aspects, as it partakes of the character of northern as well as southern cultivation. Rye, buckwheat, potatoes, chestnuts, are principally cultivated in the Alps, in the Apennines, and their spurs. In the rolling country and in

* In reducing Italian measures to the equivalents in common use in Great Britain and the United States, a "hectare" equals 2.471 acres; a "kilogramme" equals 2.204 pounds; a "kilometre" equals 5 furlongs; 8k. equals 5 miles; a "metre" equals 3 ft. 3 in.

the central belt, wheat, maize, grapevines, leguminous seed plants, hemp, and flax are grown. In the plains, and in the hilly regions of the most southerly portions, olives, almonds, and sour acid fruits thrive, and at one time, in the extreme edge of the peninsula, and in Sicily, cotton was a favorite crop.

Extent of Cultivation.—Italy is lacking in reliable recent Agricultural statistics, and it is therefore difficult to determine with relative precision the changes that have taken place in the extent of cultivation, and the sum of production. From the reports of the Superintendent of Agriculture, published in 1894, which refer to 1892, and those given out by V. Stringher in 1905, relating to 1902, the following statistics are given concerning the distribution of cultivation and the variations of agriculture from 1893-1902. According to the reports published in 1894, the unproductive lands measured 4,694, 204 hectares, of which the improvable portion would have measured 500,000 hectares; the sterile, or non-productive lands, 3,878,187 hectares; reclaimable land about 1,000,000 hectares.

PRODUCTIVE LANDS (HECTARES).

	1892.	1902.
Land under cultivation	15,267,509	15,662,000
Chestnuts	412,491	412,500
Forests	4,092,731	3,500,000
Alpine pasture lands	358,776	360,000
Total	20,131,507	19,934,500

CULTIVATED LANDS (HECTARES).

	1892.	1902.
Wheat	4,529,574	4,760,000
Maize	1,903,233	1,753,000
Rice	197,820	188,600
Barley	313,152	297,500
Rye	143,633	143,633
Oats	450,418	473,700
Beans	413,451	416,500
Potatoes	194 221	200,000
Grapevines (specialized cultivation)	500,000	700,000
Olives (specialized cultivation)	500,000	500,000
Acid Fruits	70,000	70,000
Hemp	100,794	100,000
Flax	51,588	52,000
Leguminous vegetables	200,000	200,000
Meadowland	5,519,539	5,564,000
Kitchen gardens, orchards, flower gardens	150,000	150,000
Tobacco	4 157	4,700
Sumac	25,649	25,649
Sugar Beets	———	50,000

In the 10 years under consideration there was a considerable increase of the area of cultivation, about 400,000 hectares, *i. e.* 40,000 hectares a year. During this period, what might be called a new plant came into the Italian rural economy, the sugar beet, in consequence of the high protective tariff which the government placed on the manufacture of native sugar, with the grave injury to the exchequer, and no advantage to the consumer, the advantage accruing to the speculator alone, and not to the national budget.

Agrarian Products.—Since 1894 the Minister of Agriculture has restricted his reports concerning agrarian production to approximate statistics only in regard to the six harvests; wheat, maize, rice, grapes (wine), olive oil, and acid fruits, and these are published only until 1903.

We must add to these the cultivation of beet sugar, which covered about 50,000 hectares, with an average production of 250 cwt. a hectare; and that of tobacco, much hampered by fiscal exactions, which in 1893-1894 covered 4,313 hectares (65,994,829 plants), and in 1904-1905 covered 4,780 hectares in the Campagna with 79,635,749 plants.

In spite of the relative inaccuracy in the statistical figures given, they still show an undoubted progress in Italian agriculture which is especially noticeable in the last 10 years, and this progress was much more marked in Northern Italy (particularly in Venetia and Emilia);

AGRARIAN PRODUCTION FROM 1890—1894.

NOTE—The notes of the preceding table apply to the tables of 1902 and 1903.

it was less noticeable in Central Italy; and there was little or no improvement in Southern Italy and the islands.

Forestry.—According to the Italian Bureau of Forestry the area of forests is 4,093,000 hectares, but according to the reports in 1904 the area of forest land is as follows: Forests existing in 1870, 4,300,000 hectares; forests cleared and destroyed before 1877, 160,000 hectares; forests cleared and turned into pasture land, 800,000 hectares; the entire remaining area of forest land is 3,200,000 hectares, from which are obtained the following products: Wood for charcoal and fuel, 5,800,000 cub. met.; hardwood for building and manufacture, 250,000 cub. met.; softwood for building and manufacture, 450,000 cub. met.

The planting of trees proceeds slowly. This was done at government cost, or with its aid, from 1867 to 31 Dec. 1904, and amounted to 24,504 hectares; those grown from seeds and little plants covered 15,656 hectares, making a total of a little more than 40,000 hectares.

Breeding of Domestic Animals.—Cattle exceed probably 5,000,000 head, and they continue to increase, especially in Upper and Middle Italy. Of the Italian breeds the most general is that with the gray saddle which occupies the centre and south of the peninsula. The comes the great Piedmont breed and the red saddle cattle of Emilia.

The islands also have their special breeds. The Sicilian cattle with red saddle are a modicana breed. The other breeds are either mixed, or are propagated and *nuancés* from the Alpine stock of Savoy, of Switzerland, or Austria, and these inhabit the spurs of the Alps in the Po valleys and also the plain. Whilst the cattle raisers of the Lombardy plain make a considerable profit in return for the care given to their milch cattle, those of Romagna devote themselves, to producing a breed that can be used for labor and for beef. The Alpine mountaineer seeks to put his mountain slopes to good use by grazing cattle, and the Sicilian cattle raiser experiments with forage plants suitable to the hot and dry climate of the island.

The improvement in breed may be explained by better judgment in the selection of breeding animals by the more rational manner of feeding, and by the importation of high-bred foreign stock, among which the brown saddle Swiss cattle from Canton Schwyz, and those with the spotted saddle from Simmenthal predominate.

The exportation of cattle forms a considerable item in commerce. Switzerland, in 1903, imported over 30,000 head. But the increase in production provides also for the growing demand for home consumption. In 1903 there were 1,492,369 head of oxen.

Cheese and Butter.—The manufacture of cheese is of growing importance. In 1890, 57,000 cwt. of cheese was exported; in 1905 171,000 cwt. Of butter in 1895, 44,000 cwt. was exported, and in 1905 more than 60,000 cwt. The Swiss cheese, Emmenthal brand, which are imported in large quantities from Switzerland, are now manufactured largely in Italy, as a result of the study of Prof. Moreschi, and are of the finest quality, and have become an export.

Breeds of Horses.—There are a numerous variety of breeds which, while not losing entirely the characteristic of the stock from which they are derived—and Italy is famous for its horses—have acquired new characteristics from their environment. In upper Italy the horses are bred indoors; in Tuscany, in the south, and the islands they breed in the open. The number of horses must be over 741,739 head, according to the enumeration made by the War Department in 1900.

In 1905, 652 government stallions, and 755 private ones were employed for breeding and were registered; altogether 1,387 stallions covered 53,448 mares. In 1889 there were enumerated 415 government stallions and 819 belonging to private owners, altogether 1,234 that covered 33,777 mares. In this way the stallions that private persons had employed for breeding were removed from observation, and it may be estimated that the mares used in breeding exceeded 60,000. The number of foals born annually are about 30,000. As the army drew on the resources of the country, private persons imported from outside about 40,000 head; chiefly from Austria-Hungary.

Sheep.—Italy, like all the European states sees a gradual decrease in its flocks of sheep, owing to the extension and amplification of agriculture. A few years ago, in 1890, it was estimated that Italy produced about 12,000,000 kilogrammes of wool (worth 21,000,000 lire), with fewer than 7,000,000 sheep.

The breed of sheep deserving mention are: the Bergamasca, or giant sheep; the Vissana, which inhabit Latium, the Marches, and Abruzzo; the gentile di Puglia; and lastly, the Merinos, and the fat-tailed sheep, or «barbaresca,» which are to be found in the islands, and especially in Sicily.

The flocks of Central and Southern Italy summer in the Apennines, and pass the winter in the plains of the Maremma, of Latium, of Apulia, of Salermitano, and along the banks of the Ionian Sea. Better results in production and a heavier weight of wool have been obtained by breeding with the Merinos of the Rambouillet stock.

In Latium and Sardinia cheese made of goat's milk is an important product. Latium makes an industry of altering young lambs (abbachi). The number of sheep castrated up to 1903 was 4,273,582 head. The export of sheep reaches about 40,000, of which almost all go to Switzerland.

Swine.—There has been a great increase in swine, which are made more productive by mating with the Yorkshire boar. In the south, and particularly in the Campania, the prize breed of Casertana is predominant. In the central and northern provinces the swine of Celtic type, with long snout, convex spine, with long legs, adapted to wandering across the meadows, are to be found. It may be affirmed that there are at least 2,000,000 swine. The castrated swine amounted in 1903 to 1,504,427.

The raising of pigs is now a flourishing industry, and produces an important commercial export. In 1905, 95,000 head (worth 8,896,758 lire) were exported directly to Switzerland and Austria-Hungary.

Poultry Breeding is in a primitive state. There are a few successful raisers, but most industrial attempts at poultry breeding have failed. The valuable breeds of poultry are those of the Valley of the Arno, of the Polverara, of Padua, of Martinafranca in Leccese; but it may be said that every province has some that are valauble.

In 1905 about 93,000 cwt. of poultry were exported (worth over 130,000,000 lire); of eggs there were exported in the same year over 331,000 cwt. worth about 65,000,000 lire.

Pigeons.—Large pigeons for food are produced in considerable numbers, especially in the provinces of Emilia.

Commercial Value of Agricultural Products.—Taken altogether the difference is very small between the total value of the Agrarian products imported and of those exported.

During the year 1905 the importaions gave a total, as high as 2,078,379,958 lire; and the exportations amounted to 1,707,368,145 lire (precious metals excepted). Were it not for the importation of grain of every sort, the balance would be very favorable.

GRAINS IMPORTED.

	Average. 1900-1904. lire.	1905. lire.
Hard and soft wheat	181,444,487	205,331,260
Rye, Oats, Barley	8,298,228	8,612,145
Maize	30,843,162	20,998,600
Total	230,585,877	234 942,005

The principal agrarian products which were exported are:

	Average. 1900-1904. lire.	1905. lire.
Unhusked Rice and Raw Rice	2,042,924	3,362,760
Prepared Rice	13,650,971	18,310,985

Sumac	7,138,033	5,816,007
Different kinds of Wine in casks	46,091,545	23,973,655
Every kind of Wine in bottles,	7,633,058	11,258,850
Tartar or Dregs of Wine	12,349,367	14,194,720
Purified Olive Oil	44,057,166	39,282,079
Preserved Vegetables, Fruits and Greens	10,898,272	11,679,870
Preserved Tomatoes	2,493,333	4,163,360
Essences of Orange, Mandarin, Bergamot and Lemon	8,596,481	11,722,060
Essence of Straw	7,638,486	8,844,760
Cattle (oxen and cows)	15,334,121	13,086,745
Pigs	3,629,189	8,896,758
Fresh Meat, Salt and Cured Meat	6,149,814	7,694,570
Poultry (live and dead)	11,148,532	13,268,457
Hens' Eggs	44,572,660	54,685,620
Butter (fresh and salt)	14,957,568	14,297,625
Cheese	20,178,549	26,332,300

Irrigation and Improvements.—Whilst in Northern Italy irrigation has from ancient times been carried on, in the other portions it is more recent, and not so complete, in others again it is entirely lacking, owing not alone to natural obstacles such as the rugged, topographical aspect of the region, and the perennial drought, but also to the persistence of obsolete methods of cultivation. In fact, whilst the Valley of the Po is extensively irrigated (over 1,464,969 hectares); in Piedmont 340,724 hectares; in Lombardy, 644, 513 hectares; in Venetia, 98,269 hectares; in Emilia, 68,221 hectares, and the Valley of the Serchio to a great extent, the valleys of the Arno and the Tiber remain neglected. Similarly, whilst the beautiful plain of Sulmona takes advantage of the waters of the tributaries, of the Pescara, lower valleys of this and the adjacent littoral regions are parched in summer.

The total area of land under irrigation in the Kingdom, including vegetable gardens and orchards, is estimated at 1,465,000 hectares, of which about 82,000 are irrigated by the government canals connected with the river Po (the Cavour Canal and its branches). The lands that may be irrigated with economic advantage are estimated at over 800,000 hectares.

Through the application of the laws in force, the improvements completed and in progress through government aid, up to 31 Dec. 1903, in the various sections of the country were:

	No. of Impts.	Extent of Area (hectares) Unimpv'd.	Impv'd.
Northern Italy	20	365,939	293,600
Central Italy	19	86,342	50,745
Southern Italy	50	247,727	143,832
Sicily	2	709	697
Sardinia	4	1,930	1,920
Kingdom	95	702,647	490,795

According to the allowance of public waters for agricultural purposes the area improved by

works of improvement and irrigation during the period between 1885 to 30 June 1901, amounts altogether to 211,100 hectares.

Indications of Agricultural Progress.—Some of the important indications of the progressive movement in Italian argiculture are the importation of fertilizers; the increasing use of chemical fertilizers, particularly in Northern and Central Italy, and the importation of agricultural machines and implements. The entire imports of fertilizing material which in 1901 amounted to 2,848,646 cwt. (1,421,090 cwt. of mineral phosphates, fertilizers; Thomas Gilchrist, 254,760 cwt.), at a cost of 23,562,819 lire, rose in 1905 to 4,435,197 cwt. (2,401,440 mineral phosphates; Gilchrist fertilizer, 674,590 cwt.), at a cost of 32,523,853 lire. The use of phosphates as land fertilizer increased from 3,000,000 cwt. in 1900 to 5,000,000 cwt. in 1905.

Agricultural Associations.—The work of agricultural associations, the combined acquisition of agricultural materials, has aided largely in introducing and spreading the employment of chemical fertilizers and agricultural machinery.

The Italian Federation of Agricultural Associations, founded in 1892, consisted in 1900 of 229 agricultural associations, and 348 members, and the consignation of goods imported amounted to 3,806,789 lire. In 1905 the federated associations numbered 468, and the membership 472, and the value of the imports had risen to 9,389,188 lire.

Not all the agricultural associations are members of the federation; many are branches affiliated with the Agrarian Associations and Committees. The Committee of Purchase for the Agricultural Association of Friuli (Udine) gives the following figures: In 1905, nitrate of soda distributed 4,000 cwt.; in 1906, 7,800 cwt.; orders for 1907, 15,000 cwt. In 1905 they distributed 150,000 cwt. of phosphates; in 1906, 200,000. Orders for 1907, 350,000 cwt.

In 1896 there were imported of various machinery 17,536 cwt., at a cost of 1,578,240 lire; in 1900, 40,637 quintals at a cost of 4,266,885 lire; in 1905, 66,931 cwt. for 6,358,445 lire.

The «Federazione Italiana des Consorzi Agrarii» gave to its associates during the year 1901 agrarian machines for an amount as high as 185,156 lire; in 1902 for 550,000 lire; in 1003 for 1,952,000 lire; in 1904 for 2,062,410 lire; and during 1905 for 2,260,183 lire.

Agricultural Classes: Hemography, Economical Reports and Hygienic Conditions.—According to the census of 10 Feb. 1901, the agricultural population was numbered 16,836,551; of whom those above 15 years of age, namely the adult people employed in rural works, were divided as follows:

Farmers who cultivate their own lands	2,305,795
Metayers (partners)	1,731,546
Tenants—farmers and lease holders	659,489
Stewards and rural agents	28,881
Countrymen, ploughmen, etc., at regular work	828,434
Rural laborers, at no regular work	2,423,336
Herdsmen and shepherds, etc.	172,382
Gardeners and cultivators of acid fruits	77,599
Total	8,227,462

A total 413,509 higher than in the year 1881. The persons employed in agriculture between the ages of nine and fifteen years of age up to 10 Feb. 1901 comprised 9,611,003 individuals.

The number of males employed in agriculture (6,411,001) is double that of females (3,200,002). To every 100 males employed in agriculture, there are, in Piedmont, 77 women; in Liguria, 65; in the Marches and Abruzzi, 64; 56 in Venetia; 53 in Lombardy; 52 in the ex-duchies of Emilia, and only five in Sardinia; 13 in Sicily, and 31 in Apulia.

The highest percentage of male agriculturists who worked their own land or that of their family was in Piedmont, Liguria, and Abruzzi; the lowest was in Romagna, Calabria, Sicily, and Tuscany. Tenant farms are found in notable numbers only in Latium, Apulia, and Campania. Farms abound more particularly in Venetia, Campania, Basilicata, and in the Emilian ex-duchies. They are rarer in Umbria, Latium, the Marches, Tuscany, Sardinia, Romagna, and Sicily. Farming on shares is customary in the Marches, in Tuscany, Umbria, and Romagna, and rare in Apulia, Basilicata, Piedmont and Sardinia. The countrymen paid for regular work are found especially in Lombardy, Basilicata, in the ex-duchies of Emilia, and in Sicily; those paid by the day, in Apulia, Sicily, Calabria, Sardinia, and Latium.

As regards agricultural contracts, as Jacini observed, the Italian nation has shown great discernment. One can see clearly that the character of the existing contracts to-day, was owing, not to chance, but to local conditions. Every form of contract would be more or less successful, according to the character of the contracting parties, and as they corresponded or not to the physical and economic conditions of the particular locality.

Hygienic Conditions—Malaria.—By reason of its conditions of soil and climate, Italy, of all countries in Europe, offers the largest field for malarial disease. Levy estimated, many years ago, the number of victims of malaria at 60,000; but since 1881 Sormani shows these figures to be exaggerated. From the Statistics on Causes of Mortality it is seen that during the period of 1887-1902, there was a maximum of 21,033 cases in 1887 and a minimum of 9,910 in 1902. The work of improvement, the preventive and curative means employed to combat the malady have contributed to lessen the rate and the intensity of the disease. The miasmatic belts were, in 1906, 3,349, distributed over the territory of 2,654 communes (the Kingdom consists of 8,262), of which 938 are considered totally malarial. The only provinces free from malaria are Ancona, Arezzo, Cuneo, Florence, Piacenza, Genoa, Lucca, Macerata, Parma, Pesaro, Urbino, and Porto Maurizio. Malaria has been fought by the government through a series of laws, the principal one being the distribution of quinine by the government. In 1905-1906 the government sold 18,712 kilogrammes of quinine; the mortality was 7,838.

Pellagra.—It has now been ascertained that pellagra is caused by a toxic poison induced by the eating of maize, and there is no pellagra where maize is not used for food. From the investigation instituted by the government in 1899 into the nature of the disease it was found that there are 40 provinces (all in upper and middle Italy) more or less severely afflicted by this endemic disease. Abruzzi, Molise, Campania, the

Apulias, Basilicata, the Calabrias, Sicily, and Sardinia may be considered entirely free from the disease. The census of 1881 showed that in a population of 6,386,504 persons (which did not include all the provinces afflicted with this malady) the number of those suffering from pellagra was 104,067; while the census of 1899, made by the Interprovincial Pellagralogical Committee of Udine gave 72,603 among a population of 7,033,440 inhabitants. In the 15 years from 1890-1894 the annual average rate of mortality from Pellagra reached 3,767. By the middle of the 15 years, 1900-1904, it was 2,846.

Civic Customs.—In Italy, besides the Collective Property Ownership, which varies in origin and form, there exist private landed property and communal landed property over which the community has the rights of forestry, grazing, and agriculture, etc.

Collective Property is an institution here and there in all districts, and is especially common and of great extent in the ex-pontifical States, and in Emilia, where it covered an area of 106,000 hectares in 1905 (77,800 of wooded and pasture land, and 28,200 agricultural and other land) and had an approximate value of 24,000,000 lire, and was held, altogether, by 60,000 families (about 280,000 individuals) united in associations as Communes.

The government domain of the southern provinces and Sicily is also for public use, a survival of the laws of the feudal system, which represent another typical form of collective ownership, the legal authority over which is vested in the Commune, whilst the profits derived from it belong to the citizens. These domains cover about 636,000,000 hectares, not all, however, as yet of benefit to the population, for the reason that they have been in part taken possession of by private individuals or by religious bodies who hold them as their patrimony.

Closely related judicially to the institution of goverment domain is that of the *beni exademprivili* of Sardinia, which covers at present an area of about 180,000 hectares.

The *Tratturi* are grassy roads which extend from the mountains of Abruzzi across the slope of the sub-Apennines to the tableland of Apulia, as if the mountain pastures should extend to the Tavoliere, to the Murge, to the Salentine peninsula. These grazing lands will always exist, and will preserve their character as public property, and hence unrestricted inalienable, always renewable. Without them the migrations of the flocks and herds would not be possible, as the summer pastures are hundreds of kilometres distant from the winter pastures. The *tratture, tratturelli* and *bracci* are 83 in number, of varying area, the four largest of which cover collectively more than 790 kilometres, and in all their length about 111 metres wide, and with a total length of 3,062 kilometres.

The number of head of cattle in the 10 provinces gathered together in these networks or roads (Aquila, Chieti, Teramo, Benevento, Campobasso, Avellino, Potenza, Bari, Lecci, and Foggia) amount to about 2,720,000, of which 1,120,000 are nomadic grazers, and 1,600,000 are stationary. 528,000 head of sheep and 30,000 cattle and horses still make use of the *tratturi* of the government domain, to travel to the plain of Apulia, and the other 321,000 head of sheep migrate to the Roman territory.

Mortgages.—Until a few years ago it was claimed that the interest-bearing mortgages that burdened the Italian landed property exceeded 9,000,000,000 lire. Instead of that, according to the results of the first investigation—made by the general administration of demesnes—on 31 Dec. 1903, the entire capital burdened by mortgages amounted to 3,042,402,793 lire, the number of titles to 829,259 with an average value of 3,669 lire. Of the 829,259 mortgages, 407,997 were on land alone (797,023,194 lire); 184,232 were on manufactories (783,664,586 lire); and 241,030 on lands and factories (1,460,815,013 lire).

The 65 per cent. of mortgages among private individuals did not exceed a rate of 5 per cent. interest; 31 per cent. of the same an 8 per cent. rate of interest. Four per cent. of the mortgages at 8 per cent. interest were principally in the following provinces: Abruzzi and Molise, 20.5 per cent.; Campania, 9 per cent.; Apulia, 14.2 per cent.; Basilicata, 15.2 per cent.; Calabria, 15.9 per cent.; Sicily, 8.5 per cent.; and Sardinia, 9.6 per cent.

Hon. Paolo Casciani,

Member of Parliament; Commendatore della Corona d'Italia; Professor of Agrimony, Royal University of Rome.

28. Italy—International Commerce. As the present kingdom of Italy was only established in Sept. 1870, we cannot go back further than 1871, in considering the progress of the Italian commercial movement. We shall therefore begin to consider the foreign commerce of Italy from 1871.

The import trade of Italy greatly exceeds her export trade, which fact depends on two principal causes: on the manner in which the customs officials appraise the merchandise; and on the fact that the enormous rush of foreign visitors to the country brings in a great quantity of money, which makes possible an infringement of the fundamental principle of an exchange of products.

In the 35 years, lasting from 1871 to 1901, the excess of imports was not uniform, and these great fluctuations depended on general causes.

From the year 1896 to 1900 there was a period of increase of imports, which was still more marked in 1900 and 1901, when the rate of increase was maintained at three hundred and twenty millions of lire.* But the entire commercial movement represents an increase from twenty-nine hundred to three thousand seven hundred and forty-five millions. The characteristic, therefore, of the present commerce of Italy, as shown by the Custom House statistics, is a constant excess of imports.

Finally, there is the period of rapid rise which lasted for eight years, and which, accompanied by so many other indications of the growing commercial activity of the country, gave an assurance that this sign of prosperity was

* Five lire represent a little less than one dollar in United States currency.

founded on a solid basis. Here are the relative figures, given in millions:

1898	1,413	1902	1,775
1899	1,506	1903	1,861
1900	1,700	1904	1,913
1901	1,718	1905	2,078

The periods of greater exportation are as diverse as the causes that determined them. There was a long time—17 years—from 1871 to 1887, during which the fluctuation was barely perceptible; Italian export trade remained steady at the million mark, very gradually diminishing during the three years 1881-83, when there was a fall in exports.

In 1888 the new general tariffs and the new treaties of commerce, but above all the application of the tariff of reprisal between Italy and France, brought about a period of unusual depression, which lasted 10 years before the export trade resumed its previous figures. But dating from 1898, there began a period of prosperity which is noteworthy and gives the highest figures in all the 35 years:

1895	1,203	1902	1,472
1899	1,431	1903	1,517
1900	1,338	1904	1,017
1901	1,374	1905	1,707

The division of Italian commerce into the five great groups into which we usually divide the various products, denotes the nature of her commerce; and as we desire to bring our comparison up to as late a period as possible we will continue them through the years 1905 and 1906. In 1905 the variations between imports and exports gave the following figures in millions of lire:

	Imports.	Exports.	Diff.
First class raw material	822	252	570
Partly finished material	428	618	190
Manufactured articles	463	417	46
Foodstuffs	363	418	45

Comparing now the statistics of 1896 with those of 1901 for the same articles we find:

	Imports.	Exports.	Diff.
First class raw material	457	181	276
Partly finished material	214	332	110
Manufactured articles	248	226	32
Foodstuffs	252	320	18

It was, therefore, 10 years ago that we found the same remarkable increase in the exports of the first class, agricultural products; but the foodstuffs increased in importation as well as in exportation; so that on the whole they exceeded the trade in manufactured articles, notwithstanding the fact that within 10 years the imports of grain rose from 110,000,000 to 205,000,000 lire, the group of foodstuffs shows an increase of 45,000,000 lire, hence a growth of 113,000,000 lire of exports, as against a growth of 68,000,000 lire in the import trade of the same group.

Thus the third and fourth groups are hardly balanced in 1896 by the increase of trade of the second group, but they do not balance all the growth in imports of the raw material. This increase in the trade of the groups mentioned, within the decennium, can be estimated more accurately by following the rates:

	1896.		1905.	
	Impts.	Expts.	Impts.	Expts.
	(Per cent of the whole.)			
Raw material	38.96	17.29	39.60	14.83
Partly finished material.	18.28	31.61	20.60	36.23
Manufactured articles	21.21	20.61	22.33	24.44
Foodstuffs	21.55	30.49	17.47	25.50
	100.00	100.00	100.00	100.00

These tables show that in the last 10 years the imports have increased 1.36 per cent. in proportion to the whole in first-class merchandise, and the exports have decreased at a greater rate —that is 2.46 per cent.; that the merchandise of the second group was imported in an increase of 2.32 per cent. of the whole, and the exports increased even more, that is, 4.62 per cent.; that manufactured articles were exported in an increasing ratio of 3.83 per cent. above 1896, and hardly reached 1.22 per cent. in imports; that the trade in foodstuffs showed a decrease of 4.08 per cent. from that of 1896, and finally decreased 5.99 per cent. Taking altogether the improvement in trade in the groups we find that while there is an absolute growth in the trade in foodstuffs, there is a noteworthy decrease in the trade of other groups.

Let us now take up the principal divisions of each group, both imports and exports, and see what advance they have made.

The statistics of the Italian Department of Commerce separate all merchandise into 16 categories, of which we here give a table, covering imports and the exports, for the first two and last two years of the decennium 1896-1905.

From this brief summary we may draw three conclusions. (1) An increasing development of national industries, which demands an increasing quantity of articles of the first class, and will enlarge the sphere of the export trade; (2) a greater degree of prosperity of the country which increases the demand for home consumption of manufactured articles and foodstuffs; (3) a transformation of the agricultural industry, which is losing ground in some of its exports and gaining ground in others.

Asiatic Turkey	.....	.....	.....	9,653	17,448	— 7,795

We must observe, however, that commercial exchange with other countries is greatly facilitated at the present day; that the principle that «Products can be exchanged for products» is less applicable in the transactions between one government and other separate governments; and that we can see more readily than ever before that there is a noteworthy equilibrium of commercial exchange between one country and another. But as the commercial treaties, in modifying the ultra-protectional character of the general tariffs, aim at improving those commercial relations, which tend to equalize the value of the imports and the exports between every country, it is interesting to note this side of international commerce.

The statistics since 1904 by which the value of the imports as compared with the exports between Italy and the principal foreign countries are lacking.

But in the case of those countries with which the Italian import or export is to the value of 10,000,000 lire, or more, there is evidence of a fair equilibrium; a few are excepted, which will be specially mentioned. Great Britain, in 1904, exported an excess of 175,000,000 lire to Italy, but if we consider that 143,000,000 of lire represents the hard coal which she sold to Italy, the difference is reduced to 32,000,000 lire, a comparatively small figure. Russia exports to Italy 145,000,000 lire more than she imports from that country, and this is accounted for by the 135,000,000 of lire of grain which she sold to Italy. The British possessions in Asia export an excess of 89,000,000 lire to Italy, 60,000,000 of which represents raw cotton in bulk, which Italy imports from India. The 71,000,000 lire of excess of importation from China comprises 65,000,000 lire of raw silk in bulk. The excess of 38,000,000 in imports from the United States is owing to raw cotton, of which Italy imports 146,000,000 lire.

The principal exports of Italy are to Switzerland, which buys from her over 160,000,000 lire of raw silk in bulk, and to European Turkey and Egypt where the excess of her exports is owing to cotton and silk textiles, which Italy sells to those countries. In conclusion the excess of imports from Italy to the Argentine Republic is owing to wine, olive oil, and cotton textiles, which she sells to that State.

The balance of trade is less in her favor, for various reasons in her commercial relations with Austria Hungary, France, Germany, and not the least of these reasons are the unsatisfactory Custom Duties, which are more rigorous in regard to imports than to exports in which the amount and value are estimated, as a simple form, and without any special benefit to the administration.

We will now consider the effect of the attempt that Italy is making to find fresh markets for her products. We have already seen that she has increased her exports to Egypt and Argentina to the amount of from 14,000,000 to 46,000,000 lire in the former, and from 57,000,000 to 129,000,000 lire in the latter instance, and we observe the export movement towards Belgium, European Turkey, Sweden, Norway, Greece, and Malta.

This brief summary of the foreign commerce of Italy will now be completed by a few figures relating to the trade in precious metals. Although we know that the proposed customs duties are more unsettled than ever, and that they do not represent commercial value, or exchange, we will simply give the figures relating to the imports and exports of raw gold, gold and silver coin, in 10 years, 1896-1905. The table will show that Italy is slowly gaining in wealth:

	Impts.	Expts.
	(Millions of lire.)	
1896	10.2	19.9
1897	8.6	23.0
1898	3.4	19.6
1899	5.5	15.8
1900	7.2	16.5
1901	11.7	16.3
1902	34.7	9.9
1903	156.7	6.7
1904	44.5	9.7
1905	169.5	8.2

Arturo Jehan de Johannis,
Director of the Royal Institute of Social Science, Cesare Alfieri, Florence.

29. Italy—Finance. The public debt of Italy, its origin and development, reflects on the difficulties Italy experienced in becoming a great nation. The new nation took upon itself the obligations of the various territories out of which it grew and respected all the engagements made by them.

When Italy was united in one great nation

and when the province of Venice and the Province of Rome were united to the Italian nation, the interest charges on the public debts of the ex-states were formed as follows: Bonds bearing 5.4 and 3 per cent. interest—

CONSOLIDATED—5 PER CENT INTEREST.

Sardinian States	57 937,695.05
Lombardian	7,351,387.81
Venetian	7,370,551.00
Modenian	780,508.99
Parma	610,453.95
Bologna	121,500.00
Consolidated Pontificial States	1,323,725.75
Redeemable	1,982,153.18
Tuscan	1,657,054.00
Neapolitan	25,648,375.00
Sicilian	6,800,000.00
Amounting to	111,583,407.73

*Note.—An Italian "lira" is equal to nearly 20 cents.

Capital amounts equal to.....2,231,668,154.60

CONSOLIDATED—4 PER CENT. INTEREST.

Sardinian States	1,739,280.00
Lombardy	179,797.72
Venice	41,909.00
Naples	355,257.50
Capital amount equal to	2,316,244.22

CONSOLIDATED—3 PER CENT.

Sardinian States	4,159,280.00
Tuscany	4,208,730.00
Modena	14,025.43
Equal to a capital value of	276,607,169.19

Therefore the inherited public debts amounted nearly to the sum of 2,516,000,000 lire, so there remained only the obligations at 5 per cent. and 3 per cent.

At this time the public debt of Italy was divided into three groups: Public Debts,—administered by the general direction of public debts; Public Debts,—administered by the general direction of foreign countries; and the different passivities. The essential part of these passivities is formed by those which are administered by the Director of Public Debt. When the Organic Law of 1861, No. 94, was passed, it was aimed to give a solid form to the public debt. They also ordered and formed the «Big Book,» in which they could inscribe the parts written in an authentic form and the guarantees and privileges of the law. A new series of public laws was formed, in order to recognize sufficiently the debts of the different states, by which the main portion of those debts were recognized. Italian obligations were inscribed in the «Big Book.»

In enrolling the formation of Italian public obligations we find that the forms of public duties handled by the general administration are classified in the three following categories: (1) Consolidated obligations; (2) Obligations entered separately on the Big Book; (3) Obligations not entered in the Big Book, or special bookkeeping accounts.

Regarding the obligations separately entered on the Big Book, they are equally redeemable as the perpetual ones. This perpetual debt especially found its origin in the debts of the former state of Modena to private persons, and from the income promised for the support of the Vatican. These passivities bear 5 and 3 per cent. interest. The redeemable debts were also caused by obligations of railroads assumed by the states of Tuscany and Parma and by obligations established by the Italian State to supply the expense of special railroads in Piedmonte, and to be added in this transcendental operation by the conversion of the ecclesiastical properties. Some parts of the redeemable obligations were greatly reduced, 30 June 1906. The following amounts represented the duties enclosed separately in the Big Book:

PERPETUAL OBLIGATIONS.

For support of the Pope	3,225,000.00
Obligations and other expenses for Modena	15,384.20
Total	3,240,384.20

REDEEMABLE OBLIGATIONS.

Obligations on railroads of Tuscany and Parma	2,048,663.14
Catholic loans for the ex-states of the Pope	1,578,450.00
Obligations 5 per cent. of the ecclesiastical rules	2,929,950.00
Obligations 5 and 3 per cent. for some special railway lines in the Piedmonte	3,847,316.00
Total	10,404,379.14

According to the above figures we have a total sum of 13,644,763.34 lire of interest derived from bonds, and bonds redeemable separately inscribed on the Book.

Duties not named and not inscribed separately on the Big Book, handled by the general direction of the Public Debts, are more interesting.

Their origin was found in the laws for redeeming the precedent debts, or from the law of new rules, which were required by the establishment of the Big Book. Therein are inscribed various works, generally for economical purposes, *i. e.* development of means of communication, or for hygienic purposes or for the coast defenses or accommodations of the big cities. These are divided into the five following classes:

1. Obligations to redeem the railroad lines and canals, already built. Similar obligations, 3 and 5 per cent. for the Society of Roman Lines. (Lines of Livorno, Luca, Pistoia, Central Tuscany, Apiano, Grosseto and Rome) and those for redeeming the Cavour Canal.

2. Obligations regarding the new building of specified lines, such as the 3 per cent. of the Turin lines, Savoia, Acqui, 5 per cent. of Genoa, Voltri of the Udine, Contello lines, the societies of the lines of Monferrato, and the lines along the Turreno Sea.

3. Obligations for completing the principal lines, and for supplying the capital necessary to increase the patrimonial property (for increasing the stations, and lines, the iron stock, wheels, etc.). Similar obligations of 3 per cent. of the societies for renting the Mediterranean, Adriatic, and Sicula lines.

4. Obligations to protect Rome from the waters of the River Tiber, for the works regarding the course of cleaning water conducts in Rome and Naples.

5. Different capitals not profitable.

The complete interest of the State on above

obligations was on 30 June 1906, 48,372,648.60 lire on a capital of 1,416,575,607.20.

These forms of obligation handled by the direction of the public debt were also administered by the general direction of the treasury, and various forms of obligations and passivities. Having pecuniary importance on the first acception, and of the yearly interest due until the year 1968 to the society of the Southern Railroad and of Austria to redeem the lines of the North of Italy for the total amount of 25,631,548 lire, leaving a capital of 925,201,302.04 lire.

Of equal importance with the Italian Public Debt are the railroad obligations which are directly contracted by the State, or guaranteed by the State to provide for the construction and for repairs or to complete the railroads, and more often, together with contracting societies, to obtain enough money for their own works and for which they indebted themselves to the State.

A railroad debt (or bond) to the amount of 1,468,814,140.00 lire was authorized for that purpose, but the capital actually realized was less than that amount.

These shares were issued at the following terms: 500 lire and 250 lire, redeemable in 50, 60 and 90 years.

A more thorough observation would indicate the meaning of their singular organizations and would reveal the real income, by the companies, through them and to the State which succeeds them for particular titles. The first attempt at redemption was made in 1891 by the Minister of Treasury, Louis Luzzatti, who instituted serious economies; especially by suspending the emission of the obligations for construction of railways.

During 1894 and 1895 another and more efficient impulsion to this economy was created by the Minister of Treasury, Sidney Sonnino, forming two new types of consolidated 4.50 and 4 per cent. net.

The various attempts at a reduction of the Italian national indebtedness and particularly of the high interest charges on the same culminated in the successful conversion studied and prepared by Louis Luzzatti while minister of the Treasury in the cabinet of Sonnino, and presented 29 June 1906 by Minister of the Treasury A. Mojorana of the Giolitti cabinet.

The conversion was in reference to the consolidated 5 per cent. gross, and to the consolidated 4 per cent. net. The first, of 30 June 1906, amounted to a capital of 7,003,545,040, and the other, to the sum of 196,889,800. Both capitals amounted to 8,100,434,800.

By the said law of 29 June 1906 (No. 262) the Ministry of the Treasury was authorized to abolish the 5 per cent. gross, and the 4 per cent. net, offering to the holders thereof one hundred lire or the payment of the entire certificate at a loss of two lire, on 1 Jan. 1907, and the exchange of the old bonds of 5 per cent. gross and 4 per cent. net, for a new emission of securities with interest at the annual rate of 3.75 per cent., payable semi-annually, to be exempt from any present or future tax from 1 July 1907 to 1 July 1912, and to pay 3.50 per cent. per year, with the same exemption, from 1 July 1912.

The result was a complete success. The payments on exchange amounted only to the sum of 4,689,700. Of this amount 3,027,800 was on the exterior, and 1,661,900 on the interior, for the capital to be converted only on the ratio of 0.056 per cent. As for the total cost of the refunding operation, including general charges, commissions, and all other expenses, it totaled only 9,637,153.62 lire, which was less than 12 centimes for every 100 lire of nominal capital to be refunded, and was only 0.87½ per cent. of the amount placed at the command of the two syndicates for the purpose of meeting every possible contingency. On the other hand the profit for the national finances, because of the reduction of the interest, was very considerable. In fact from 1 July 1907 until 1 July 1912 there will be a saving of 20,254,017 lire each year. From 1 July 1912 until the year 1920 a double saving will be obtained, and in the 13 years taken together the total saving to the treasury in interest charges will exceed 400,000,000 lire.

The public expenditures are naturally largely influenced by the receipts from taxes. These are chiefly the tax on real estate, on buildings, and on rents. There is also a considerable tax on the transfer of real estate, and a tax on commerce, as well as on insurance and other commercial transactions.

Besides the contributions direct and indirect on business, real estate, rents, etc., there are the various well-known forms of taxes, *i. e.*, the taxes of succession, taxes of registration, taxes on loans, custom house receipts, profits on sale of salt, profits of the tobacco, and lottery monopolies, etc.

In accordance with this, the national receipts of the year 1905–1906 were 1,945,955,181.73 lire and the expenses were 1,860,514,249.31; the difference between the two entries showing a surplus of 85,440,932.42. The construction of railroads caused a loss of 14,228,668 lire, as shown by the ministry of public works.

There has been an actual surplus for the past nine years, a solid evidence of the prosperous conditions of the Italian finances.

Considering the public expense and regarding its purposes, we note the division of the effective expenses (ordinary and extraordinary) for each one of the ministers distributing them to cover constitutional purposes, as payments of interests, collection of taxes, and especially for the purpose of the administration.

The effective expense (ordinary and extraordinary) consequently, including the capital movement, is divided by the ministers as follows:

	Lire.
Treasury minister	736,277,017.36
Treasury of the finances	257,853,176.96
Treasury of the thanksgiving justice and customs	43,883,684.42
Treasury of the exterior affairs	17,258,546.83
Treasury of the public instruction	68,696,551.47
Treasury of the interior	106,356,174.61
Treasury of the public works (enclosed) the constructions of railways	104,265,813.58
Treasury of mails and telegraphs	96,896,305.81
Treasury of war	296,773,725.31
Treasurer of marine	128,376,537.34
Treasury of agriculture, industry and commerce	18,105,483.62
And consequently the effective expenses amounted to	1,874,742,917.31

This large sum can be divided as follows:

I. CONSTITUTIONAL EXPENSES.

Donations and presents	16,050,000.00
Expenses of the chamber of legislation	2,514,444.87
Expenses of the high personages of the states (President of the council, of the Ministers, the counts cour and the State counsel)	2 762,411.76
Total	21,326,856.63

II. EXPENSES OF THE ADMINISTRATION OR EXPENSES FOR THE ADMINISTRATION OF THE FINANCES.

For the administration of public money and for collecting the contributions,	259,914,462.98
For the public safe and bookkeeping. The duty for the support of the employers are excluded but enclosed on the expenses of the administration	714,542,482.72

The administration named The Public Security and consequently for:

The war and marine	425,150,262.65
The diplomacy	17,258,546.83
For justice and penal punishment and prisons	72,285,165.33
Police, defending the interior administration	51,238,277.59
Total	565,932,252.40

For the Public Prosperity and consequently for:

The public instruction	68,696,551.47
The public health	2,755,386.30
The beneficience and provisions	24,446,826.24
Public works and means of communication	201,162,119.39
For the industries	15,964,978.18
Total	313,025,861.58
The total amounting to	1,874,742,917.31
The effective debts results amounting to	1,874,742,917.31

Concerning the expenses for the public prosperity, it is only 16.90 per cent., the rest being absorbed by the constitutional expenses (1.12 per cent.) by the expenses for collecting the contributions and taxes (13.68 per cent.) by the representation on the exterior (0.90 per cent.) and by the expenses for the internal security (6.09 per cent.).

On the other hand a consideration of the entries, expenses and the financial power of the entries and a form of the balance of the entries of 1905-1906 can be divided in the following manner:

ORDINARY ENTRIES.

	Lire.
Patrimonial rents of the state	95 357,509.08
Entries of public services (mails, etc)	129,642,085,11

DIRECT CONTRIBUTIONS.

Contributions for the lands	95,926,482.96
Contributions for the buildings	93,151,611.48
Contributions for the rents of movable property	305,250,307.62
Contributions for affairs	259,588,996.63
Contributions for consummation and (brevetto) patents	873,427,096.71
Surplus and concourse on the expenses and various entries	79,023,699.51
Total of ordinary entry	1,931,367,789.10
The extraordinary entry independent of the movement of capitals	14,587,392.63
Total of the effective entries	1,945,955,181.73

Popular Discount Banks.—A study of the Italian system of banking is of importance for the reason that with its finances it is found possible to dispose of a large stock of the capital in order to assist commercial operations.

In general the Italian system of banking has no marked difference from the various systems of the European continent, especially from the French and Spanish standpoint. Recourse may be taken to a pyramid. The popular banks are at its base, and various institutions of less import; the societies of credit are higher, terminating with the «Bank of Italy,» superior to all, aided by two institutions; the Bank of Naples and the Bank of Sicily. The Societies of Actionists maintain the popular banks, and have only a limited responsibility. Their system is one of co-operation, loaning money to members only and sharing profits among themselves.

In 1902 there were 163 banks with a capital of 255,000,000 lire.

The emission institution, the «Bank of Italy,» «Bank of Naples,» and «Bank of Sicily,» the first of which is a society with a capital of 240,000,000 lire, form the main body of this system of banking; the others being moral bodies.

This rule is principally based upon the guaranty of the circulation by a metallic reserve, as provided by law. The maximum and normal limit of the circulation of the above Institutes is fixed at 1,010,000,000 lire. Of these 732,000,000 at the Italian Bank of Italy, 226,000,000 at the Bank of Naples; 51,700,000 at the Bank of Sicily. The reserve being 4 per cent. of the note circulation.

The emissionary institutes are subject to supervision of the government, who proceed by ordinary and extraordinary inspections. The director of the Bank of Italy is confirmed in his charge by the government. Those of Naples and Sicily are directly appointed by him.

To complete this brief account we may state that the circulation of bank notes payable to bearer was, in 1905, for the Bank of Italy, 929,990,560,416 lire; Bank of Naples, 29,824,-979,722 lire; for the Bank of Sicily, 67,480,711.11. The metallic reserve was, on 31 Dec. 1905, for the three institutes, 1,076,418,372 lire in gold; 805,877,224 in silver; 108,208,903 on foreign security and 133,241,062 on Italian securities.

Hon. Giulio Alessio,

Member of Parliament; Formerly Secretary of State for the Treasury; Professor of Finance, Royal University of Padua.

30. Italy—Emigration. The remarkable development of Italian emigration gives an altogether general interest to this sketch, which will deal principally with the 30 years (1876-1905) of which alone there are official statistics. Even outside of Italy there is an ample statistical bibliography in regard to Italian emigration; the most valuable works are those of Senator Luigi Bodio, who for many years was Director-General of the government statistics, and there are also very interesting articles concerning emigration published in the *Bulletin de l'Institut international de Statistique*, of which Institute Professor Bodio was general secretary from its inception (1885) to 1906. There is lacking, however, a complete and recent account of Italian emigration, and of its various phases within the last 10 years. Wor-

thy of record are, among others, the works of Nitti, Villari, Bosco, Tammeo, Adolfo Rossi, and in general the *Bollettino della Emigrazione*, published by the Commissioner of Emigration in the Ministry of Foreign Affairs.

Italy in the 19th century only had a remarkably large emigration after it became an independent kingdom. She had, it is true, the political exodus of 1815, 1821 and 1831; but those people did not leave any traces worthy of mention, except that among a great number of emigrants who were recruited to fight for the liberation of Italy there were scientists and geniuses of the highest rank who exalted the Italian name and made it honored in foreign lands. In the *Annuario Statistico Italiano*, published in the middle of the last century by a Master of Italian Statistics, Cesare Correnti writes:

«There are a very large number of Italians residing, or wandering outside of their own country. Italian families have been settled for centuries in the Islands of Quarnero at Fiume, in Dalmatia. Fugitive adventurers, merchants, Italian doctors are found scattered in almost all the ports of the Levant. In the Algerian colonies about 15,000 Italians have settled during the last 10 years. The United States received another 10,000; and there are more than three times as many who are merchants, farmers, or industrial workers in Argentina, Uruguay, Brazil, and the other countries of South America. Recently an Italian colony has tried its fortune in Mexico, and some Ligurian vessels weighed anchor with Italian emigrants for Australia.» But after that period the progress of the emigration has been continuous.

Official statistics give following table of Italian emigration to foreign countries:

EMIGRATION IN THE YEARS 1886-1900.

Years.	Permanent.	Temporary.	Total.
1886	85,355	82,474	167,829
1887	127,748	87,917	215,665
1888	195,993	94,743	290,736
1889	113,093	105,319	218,412
1890	104,733	112,511	217,244
1891	175,520	118,111	293,631
1892	107,369	116,298	223,667
1893	124,312	122,434	246,751
1894	105,455	119,868	225,323
1895	169,513	123,668	293,181
1896	183,620	123,862	307,482
1897	165,429	134,426	299,855
1898	126,787	156,928	283,715
1899	131,308	177,031	308,339
1900	153,209	199,573	352,782

In the last five years (1896-1900) the total emigration closed with an increase of almost 50,000 emigrants, and it is noteworthy that the increase is due to the temporary emigration; for the permanent was rather on the decrease. And we must also nevertheless notice the fact that the regular emigration increased when the economic conditions of the country began to show improvement. But, in reality, the temporary emigration which took place, particularly in the provinces of Northern Italy, took the place of those emigrations of laborers, which have for a long time been customary in Central and Southern Italy, and which have certainly increased in the last 20 years owing to the greater facilities of communication and transportation.

EMIGRATION IN THE YEARS 1901-1905.

Years.	For Trans-Oceanic Countries.	For Europe and Mediterranean States.	Total.
1901	279,674	253,571	533,245
1902	204,654	246,855	531,509
1903	282,435	225,541	507,976
1904	252,366	218,825	471,191
1905	447,083	279,248	726,331

Altogether in the 30 years from 1876-1905, of which we have the figures given by official statistics, 8,029,353 persons emigrated; and the periods that we have been considering are summed up in the following figures:

EMIGRATION.

Years.	For Trans-Oceanic Countries.	For Europe and Mediterranean States.	Total.
1876—1885	427,953	886,736	1,314,389
1886—1895	1,393,636	998,603	2,392,239
1896—1900	809,507	742,666	1,552,173
1901—1905	1,546,212	1,224,040	2,770,252
Totals in the 30 years from 1876 to 1905.	4,177,308	3,852,045	8,029,353

There are, hence, more than 8,000,000 emigrants, of whom more than 4,000,000 went to trans-oceanic countries within 30 years. And these figures may be taken to be lower than the fact, owing to the inevitable inaccuracies in statistical investigations. If the calculation had been made regarding permanent emigration, and temporary emigration, the latter would have shown figures somewhat larger than those given by the emigration to Europe and the Mediterranean States; and, on the other hand, somewhat smaller for permanent emigration than those given for trans-oceanic emigration. We see that in the last five years, 1901-1905, the emigration, taken altogether, exceeded that of all other periods, even the 10 year periods, of the 30 years; and that the figures for trans-oceanic countries are almost double those of the preceding five years 1896-1900.

A cursory glance given to the distribution of emigrants from the various regions of Italy shows us that temporary emigration is greatest in those northern regions of Italy the nearest the confines of the country; and hence emigration in those parts holds the same place that migration from one portion of the country to another held in the other regions. The permanent emigration, on the other hand, prevails in the south of Italy, and especially in Abruzzi, Basilicata and Calabria, which are, economically considered, the least progressive regions. In Liguria, which has had an industrial revival within the last few years, the emigration is very small.

Among the regions which show a great increase in emigration are: the Marches, which, in 1905, out of a population of 100,000, had 1,934 trans-oceanic emigrants; Calabria, which had 4,335 emigrants; Latium, 1,020; Abruzzi, 3,526; Sicily, 2,640, etc.

And taking the individual provinces in the various regions we find that in 1905 the trans-oceanic emigration was greater in the provinces of Caserta, Palermo, Cosenza, Catanzaro,

EMIGRATION IN THE YEARS 1903-1905.

Regions.	1903.		1904.		1905.	
	Permanent.	Temporary.	To Trans-Oceanic Countries.	To European and Mediterranean Countries.	To Trans-Oceanic Countries.	To European and Mediterranean Countries.
Piedmont	16,332	27,403	22,167	30,671	30,987	37,409
Liguria	4,302	762	5,252	1,302	6,324	1,908
Lombardy	7,749	29,124	12,481	32,278	16,211	45,845
Venetian	4,679	95,599	8,942	70,776	12,571	95,453
Emily	4,673	20,312	6,822	22,833	9,921	28,659
Tuscany	6,709	18,530	9,193	17,053	10,497	21,123
Marches	10,076	6,943	11,632	7,093	21,131	10,788
Umbria	1,374	3,939	1,231	5,452	2,464	7,435
Latium	2,414	5,744	5,386	1,181	13,116	1,586
Abruzzi	39,933	6,416	26,284	5,875	52,020	6,909

Sicily	29,646	29,174	42,016	8,646	97,874	8,329
Sardinia	8	2,428	263	4,309	441	2,360
Totals	230,841	277,135	252,366	218,825	447,083	279,248

Messina, Reggio-Calabria, Avellino, Salerno, Chieti and Potenza.

As for the emigration to Europe and the Mediterranean countries, Venetia takes the lead of all other regions with 2,965 out of each 100,000 inhabitants; Emilia follows with 1,140; Piedmont with 1,105; Umbria with 1,073; Lombardy with 1,030; the Marches with 988; and Tuscany with 800 emigrants. The smallest quota was given by Calabria, with 108 emigrants. The emigration for Europe and the Mediterranean countries (an especially temporary emigration) takes places more particularly from the northern and central provinces; while in the southern provinces the trans-oceanic and more permanent emigration is much larger.

Male emigrants predominate and the adults are in excess of the children. These two characteristics are common to the emigrants from other countries. In the three years, 1903-1905, 83 out of 100 emigrants were males, and 17 per cent. women; and of the total number of emigrants about 11 per cent. were not above 15 years old. The great predominance of males has noteworthy demographic consequences, both in the country from which they emigrate, and in the country whither they are bound.

The emigration to the United States in 1905 was nearly one-half (43.62 per cent.) of the entire number of emigrants. The number of emigrants for the United States increased gradually in the 30 years 1876-1905. In 1881 we find it at 11,842; ten years later it had quadrupled (47,952 in 1890, 44,359 in 1891), rising to a little more than 30,000 in 1894. But it soon increased again, and in a few years was over 100,000, and with a jump in 1901 to 1902 it rose from 121,139 to 193,772; the following year it increased again to 197,855. It was 168,789 in 1904, and almost doubled in 1905, with 316,797 emigrants.

But what strikes one particularly is the scanty emigration to Eritrea and other Italian possessions and protectorates in Africa, even to Tripoli; although to ensure a better future for Italian colonial politics it would be truly necessary and desirable that numerous swarms of laborers should emigrate to those regions.

But it is difficult to determine precisely the number of Italian emigrants who return to their own country, because many return by land, *i. e.* by rail, and one can get no reliable figures in regard to them; and the others who return by sea do not include all those who return home from trans-oceanic countries; a certain number of these disembark in foreign ports and continue their journey by rail.

The Italian passengers of the third class who disembarked in Italian ports were: In 1904, 168,379, of whom 129,231 came from the United States; in 1903, 96,156, of whom 68,821 came from the United States.

As for the emigrants who return home by way of land, the estimate of the Bureau of Statistics places their number at 434,807 in 1905; and 202,268 in 1904. Without attaching much value to these figures, which are only approximate, we note also that in 1904, 252,366 persons declared to the authorities their desire to leave their commune and return again to the trans-oceanic countries; and in that year 172,359 individuals were stricken off the register of the population, as they were to become permanent emigrants. In 1905, on the other hand, the former corresponding figures were 447,083, and the latter 264,670. Out of 100 emigrants, from 36 to 40 were considered, in the last four years, as emigrants for an indefinite period and were therefore stricken off the register of the population, it being understood that they had transferred their habitual domicile to a foreign country.

The great increase in emigration, whether to trans-oceanic countries, or to Europe and the Mediterranean basin, gives rise to the necessity for investigation as to what may be the causes of this tremendous emigratory movement.

There are conditions which doubtless favor, or stimulate emigration. Thus, the near neighborhood of the boundaries of a country render it easy to leave the country, even on foot, and to betake oneself to some other state to seek for work. Even the mountainous character of various regions induces migrations in the interior of the country, from hill to plain, and in great part to the emigration to foreign countries of mountaineers who are more disposed to

move about than citizens of the plains; and often they are even compelled to leave their mountain homes in the winter season in order to make a living.

But an accurate investigation into the causes should distinguish between the physical, demographical, economic, psychological, historical, administrative and tributary causes. It is impossible, here, to undertake such an investigation. Suffice it to note that malaria is a physical cause that cannot be overlooked, that the density of the population is in some cases a co-efficient of some importance, together with the high birth rate and hence the increase in the number of inhabitants, owing to the excess of births over deaths. Calabria has a very large emigration although she has not only a low density of population (91 inhabitants to the square kilometre), but has also a low birth rate and an excess of births over deaths. Liguria with a high density (204 inhabitants to the square kilometre), has a comparatively small emigration: 720 per 100,000 inhabitants, of whom 560 go to trans-oceanic countries and 160 to European and Mediterranean states.

We may certainly say that, not infrequently, where the population is least dense, the emigration is even greater; for the same causes that determine the low density—as, for instance, a lack of the means of subsistence—promote also emigration.

The demographic factors, taken by themselves, cannot be held responsible for the constant increase of emigration, as there are regions with a high birth rate, and a large excess of births over deaths, and yet with a small emigration. It is the economic conditions which give a determining power to the demographical factors, and for this reason we may say that emigration in Italy is the consequence of a superabundance of population only in the sense that they have not yet found that perfection in the conditions of existence and of labor that suffices to keep them all in their own country, especially when compared with the conditions that they find in other lands.

Although Sardinia has one of the poorest regions, she has nevertheless a small emigration (341 in 100,000 inhabitants in 1905; while the average for the kingdom is 2.161). This must be attributed to the low density of population (33 to the square kilometre) and to the conditions peculiar of the island, which are not yet influenced by the social life of Italy, and to the fact that its inhabitants are passionately attached to their native soil.

In the southern provinces, both poverty and the unprogressive character of agriculture, the low wages, the oppressive fiscal taxes, and the antiquated and almost feudal characteristics of the relations between the proprietor of the soil and the laborer, which is specially noticeable in agricultural contracts, are the causes that help to promote emigration.

To these causes must be added those of the intellectual condition in this sense, that wherever there is the greatest amount of illiteracy, as in the southern provinces, there may be found also the greatest amount of ignorance and credulity to those who cry up the far superior conditions of labor, and wages in trans-oceanic and European countries.

Having thus examined the principal causes which help to determine emigration, there still remains to note the consequences which follow from them. And it is easy to understand that the increase in population, in consequence of the tide of emigration, must have a limit. In some regions one can notice either a decrease in the whole population, or a partial decrease, *i. e.* in a greater or lesser number of communes. The Basilicata, for instance, between 1881 and 1901 (the last two censuses) has diminished; and similarly also several districts of Calabria (Rossano, Castrovillari); of Sicily (Corleone, Termini); of Venetia (Rovigo, Massa Superiore); of Piedmont (Salluzzo, Cuneo, Pinerolo, Aosta). But it is particularly the composition of the population that shows the effect of the enormous emigration. Thus, by the predominance of males who emigrate over females, the numerical equilibrium of the two sexes is changed, so that women predominate over men in the regions from which there is the largest emigration. In Southern Italy, according to Professor Bosco ('L'emigrazione del Mezzogiorno' in the Giornale degli Economisti di Roma, April 1906, p. 328) there are communities where the greater part of the population consists of women, children and old people, out of all proportion to the normal distribution of sex and age. And another sign that the emigration in abnormal numbers of the strongest members is beginning to have an effect on the physical constitution of the population is given in the remarkable number of conscripts who are refused on account of sickness, or physical imperfections, in several portions of Southern Italy.

In regard to the economic consequences, it is certain that owing to emigration Italian labor has been better paid, that it has resulted in higher wages for those who emigrated; and the proof is in the savings sent back to the mother country in considerable sums, which, altogether, are calculated at over 200,000,000 lire a year. A considerable portion of these savings is employed to support the family at home; another portion is used to defray the debts incurred by the emigrant before leaving, or on the occasion of his departure; a third portion sometimes assists parents or friends to emigrate, and hence, serves as a stimulus to emigration; finally, one portion of the savings is invested in house or land, or in some form of economic activity. We must not forget that emigration in reducing the supply of labor has tended to raise wages, and that it has procured in other countries a numerous «clientele» for Italian producers, and has procured for the mercantile marine, through its transportation of emigrants, a source of wealth which would be still greater if in this trans-oceanic movement the foreign flag was not superior in prestige to the Italian.

But as there are advantages, so there are also disadvantages arising from emigration, and among these may be mentioned, not alone the lack of labor, and the consequent neglect of land cultivation (and this may be partly remedied by migrations to the country itself), not alone the withdrawal of much of the young, active, and therefore productive element; not alone the breaking up of families, from many of which the head is absent; but also the habit of

dissipation in alcoholics, particularly among the returned emigrants. And sometimes there has also been noticed a physical degeneration among individuals: the diseases arising from bad economic conditions, it is true, have decreased; but those caused by vice in all its forms have increased. (Consult Pasquale Villari, 'L'emigrazione italiana e le sue consequenze'; in the Nuova Antologia. Rome 1 January, 1907.) Delinquency has decreased in some forms, but has increased in other special forms, so that we may say that emigration, rather than diminishing crime, has changed the form of the delinquency.

The Italian government is beginning to occupy itself with the control of emigration according to the law of 1888, which we owe to Francesco Crispi, and which was intended to prevent the frauds and abuses of emigration agencies. It was more of a primitive character than anything else and it was soon found that the intervention of the government could not be restricted to these terms, but that it must exercise an efficient control, both in the country and during the voyage, and when possible in the countries whither the emigrants were bound and where they landed. Through the special efforts of the Honorable Luzzatti, Pantano and Visconti Venosta, Minister of Foreign Affairs, the parliament sanctioned a new law 31 Jan. 1901, by which the phenomenon of emigration is truly controlled by an administrative organization, and with provisions of various character which will, if amended, give better and more complete results.

This law in its essential provisions has reference to trans-oceanic emigration only, and although Art. 29 points out that the legislation has been forced to recognize the need of protecting the other emigrants from any possible deplorable occurrence to their injury, it is nevertheless certain that the emigration to the countries of Europe and the Mediterranean have not had the legal and social guardianship they had expected. In order to study the problems in relation to these matters two congresses have already been held; one at Udine in 1903, and one at Milan, January 1907.

Many and serious were the problems that previously confronted Italy in the first years of the present century, in regard to the phenomenon of emigration. All her material, moral, and political life was at stake; and no doubt all the conditions of Italian life must improve before emigration may be restored to proportions that are not abnormal; different from those that it has assumed in the last five years of the thirty, which we considered with the aid of official statistics. It may be done, on the one hand, by not permitting the country in certain regions, especially in the south, to be depopulated of its laborers; and on the other, it may be arranged that emigration shall acquire all those qualities which serve to procure for it economic power in foreign lands, a moral authority and a just appreciation of the benefits that it confers on the countries of its destination.

RICCARDO DALLA VOLTA,

Professor of Political Economy and Finance, Royal Institute of Social Science, Cesare Alfieri, Florence; Honorary Professor, University of Padua; Author of Works on Social Science.

31. **Italy—Italians in America.** From the early days of American colonization up to recent times, the influx of Italian population to the United States was insignificant. There came to the United States, in round numbers, 500 Italians in 1865; 3,000 in 1875; 13,000 in 1885; 35,000 in 1895; 220,000 in 1905; in other words, Italian immigration to the United States from 1821 to 1905 was about 6½ per cent. of the whole inflow; in 1905 more than 25 per cent. There are to-day in the United States nearly 1,500,000 Italians, half of whom came during the last five years, at the rate of (returns accounted for) 150,000 per annum. The federal office of statistics has adopted a system of division of this immigration (northern and southern) under the racial headings Celtic and Iberic. The second type, that from the South, furnishes the largest numbers, 84 per cent., 'is largely illiterate (illiteracy rate as high as 50 per cent.),' generally poor, but not pauperistic in fact or in tendency. Eighty per cent. of the Italian immigrants are male and range between 14 and 45 years of age. Fully 70 per cent. stop in or not far from the great cities, chiefly the seaports. This tendency to gravitation is the most pronounced of the whole influx. New York has as many Italians, on a rough estimate, as Rome; Philadelphia over 100,000; in Chicago, Boston, New Orleans, San Francisco the numbers are rising daily. Since the date of the census record it is certain that the Italian-born population in all American cities has increased more or less through the influx of immigration. The first employment at hand for the average Italian on landing is offered in the cities of the North Atlantic coast or on the steam and electric railway lines, on roads, docks, trenches, basements and other public and private work which goes under the heading of unskilled labor, although most of the men who undertake it had experience at home in gardening, farming, or other home industries.

Professional occupations include actors, clergymen, editors, engineers, lawyers, musicians, physicians, sculptors, teachers; the numerical prevalence being largely of physicians and lawyers.

Trades and industries account for bakers, barbers, blacksmiths, brewers, butchers, carpenters, clerks, engravers, gardeners, ironworkers, jewellers, locksmiths, machinists, mariners, masons, mechanics, millers, miners, painters, plumbers, printers, saddlers, seamstresses, shoemakers, stonecutters, tailors, tanners, tinners, tobacco manufacturers, watchmakers, weavers and spinners. Under the heading of Sundry Occupations the Italians register bankers, agents, factors, hotelkeepers, merchant dealers, personal domestic servants.

The Italians had practically the control of the fruit trade until the advent of the Greek, both in street peddling and in the small store business; the larger trade remains in Italian hands. There is no large city in the country in which Italian progress is not marked; the advance in New York is particularly noteworthy. The economic situation of the Italian colony in New York may also be found representative of conditions throughout the country. The 450,000 Italians there own $16,000,000 in the savings banks; $35,000,000 in real estate, etc.;

10,000 shares worth $7,000,000; and their wholesale business amounts to $8,000,000 per annum; the total value of Italian property in New York—amounting to over $75,000,000—is mostly in the hands of the men who made it. New York has prominent Italian banks; an Italian Chamber of Commerce and a great number of representatives of the liberal professions, as well as a local Italian press. Most of this progress has been accomplished under severely trying conditions, in the teeth of competition, of objection and of misjudgments which too often characterize the national dealings with the problem of Italian immigration.

The rising demand for Italian immigrant labor testifies to its efficiency and desirability. The farms and plantations of the South would seem to offer good openings for profitable employment; and special opportunities in the line of market-gardening are noticeable, this last form of agriculture being very successful throughout the United States whenever attended to by Italians. But there is still to be met frequently in the South the idea that the Italian workman is something between the white man and the negro, and until this is destroyed it is obvious that the influx to the South must suffer from the prejudice. The adaptability of the Italian for cotton, rice and sugar-cane culture has already been remarked upon by experts. In other lines the extension of grape and olive-growing; the strawberry culture of Independence, Louisiana, the vineyards and wineries of the West, the flourishing agricultural colonies throughout the South and Southwest show clearly what Italian immigration might be and, in fact, what it ought to be.

Development along these lines would naturally solve the problem of congestion and answer satisfactorily the legitimate call for a better distribution, «systematic, comprehensive, and sustained.»

The high average physical vigor of the Italian immigrant, the comparatively low death rate under the new circumstances, the remarkable immunity from disease outside of the congested centres, coupled with an exceptional power of resistance and recuperation; on the other hand, the sobriety and all-round temperate mode of life, the thriftiness, the keen appreciation of what is good in American institutions, the obvious fitness for assimilation and capacity for civic education are the salient characteristics of the Italian immigrant as seen in this country. Italy is officially represented in America by the Embassy at Washington; by a Consulate General in New York; by consulates in all important centres of Italian immigration and by consular agencies in minor cities wherever required.

AMY A. BERNARDY,

Professor of Italian and Romance Languages and Literature, Smith College.

Italy, Free Church in, a reformed religious sect founded by Alessandro Gavazzi in 1870 (see GAVAZZI, ALESSANDRO). In 1874 a confession of faith was formulated, an ecclesiastical constitution framed under a General Assembly; and the title of «Free Church in Italy» assumed. The confession scarcely does more than echo those of the Protestant Churches, and the constitution is based on the government by elders, like that of the Presbyterians, though the several congregations are practically uncentralized, as with the Independents. In 1891 by royal decree, the title «Chiesa Evangelica Italiana» was given to this body. The schools of the church in Florence are partially supported by the state. According to recent statistics the General Assembly legislates for 30 congregations represented in it, of which there are 14 ordained ministers and 1,831 communicants.

Itasca Lake, farthest source of the Mississippi, in northern Minnesota. The ground has a substratum of sand and gravel, mingled with large boulders; the surface is spongy and swampy. This basin has been made a national park of about 7 by 5 miles, containing 19,701.69 acres (30.78 square miles). In the centre, fed by sources so permanent and with a flood plain so small that it has actually risen in dry seasons (though it receded some feet during the 19th century), lies Itasca, a giant among the small ponds around it, but having an area of only 1,130 acres, or 1¾ square miles. It is composed of a centre running east and west about a mile, whence extend north and south an east and a west arm about 1½ miles long each, and another northward about a mile, the width varying from ⅛ to ¾ of a mile. It has a shore line of 23,000 yards (over 13 miles). Depth, 4 to 50 and 60 feet; average, 20 to 35. The Mississippi flows from its north arm; a strong brook called by Nicollet the «Infant Mississippi» flows into the west arm. See MISSISSIPPI RIVER.

Ita'ta Case, 1891, an important international imbroglio, resulting from the *coup d'état* of Balmaceda (q. v.) and the revolt of the constitutional party in Chile. The latter through an agent had bought a quantity of arms and ammunition in New York, which were shipped to San Francisco and then sent by a schooner to the southern coast, where it was met by the insurgents' vessel, the Itata, and the cargo transferred. The vessel had a few soldiers and a little artillery on board. The attorney-general issued a writ of detention on the ground that she was violating our neutrality laws; and this failing, our cruiser Charleston was sent in pursuit, overhauled and captured her, and placed her on trial before the United States district court at San Diego. The courts discharged her as not having been guilty of such violation. The real interest of the case was political. It was notorious that our government and many of its civil and naval representatives sympathized with Balmaceda against the insurgents, and it was charged with going out of its way in order to cripple the latter; while the other party were ready to make war on the Chilean constitutionalists for defying our authority.

Itch, a contagious disease of the skin (scabies) due to its invasion by the itch-mite (*Sarcoptes scabiei*), now rather rare in civilization. Even the adult mite is so small as to be barely visible, the female being about one sixteenth of an inch long and not quite as wide, while the male is still smaller. It has eight legs, two on each side of the head, to which suckers are attached, and four behind. (See MITE.) The female burrows into the skin and deposits her eggs, about 50 in number, and dies after a period of six weeks. After the eggs hatch out, the young make their way to the surface, and the impregnated females again burrow into the skin, so keeping up the process. The most frequent sites selected by the bugs for their burrows are the web between the fingers, the front of the wrists, the umbilicus, the genitals in men, and the under side of the breasts in women. The first sign of the disease is itching, which forces the patient to scratch, particularly at night, as the warmth of the bed increases the itch. The skin soon becomes inflamed from scratching, and the discomfort is increased. Close examination may show the tiny burrow like a reddened pin-scratch about half an inch long. Many remedies are used with success but sulphur in the form of an ointment is the most common. As the bugs cannot be killed while still in the skin, a good plan is to take a hot bath with brisk rubbing, apply the ointment night and morning for three days, continuing to wear the same clothing and sleep in the same bed-clothes; at the end of that time another bath is to be taken, all clothing and bed-clothes changed, and another series of rubbings started. This must be continued as long as fresh burrows are found.

Ithaca, N. Y., city and county-seat of Tompkins County, on Cayuga Lake, and on the Lackawanna and the Lehigh Valley R. R.'s; 70 miles southeast of Rochester. It derives water power from Fall Creek and has manufactories of autophones, glass, typewriters, drop forgings, calendar clocks, firearms, salt, wall paper, agricultural implements, iron castings, machinery, etc. The city is best known as the seat of Cornell University (q.v.) and the Cascadilla Preparatory School; and also as a popular summer resort. There are two national banks, trolley connection with East Ithaca, large farming trade with Tompkins, Tioga, Cortland, and Seneca counties; and an assessed property valuation exceeding $7,000,000. In the immediate vicinity are numerous gorges and waterfalls, the most noted of the falls being Triphammer, Ithaca, Taughannock, and Buttermilk. The Taughannock is 215 feet in height and is the highest waterfall east of the Rocky Mountains. There is here the Cornell Free Library containing 21,000 volumes, the Ithaca Conservatory of Music and Renwick Park. Under the charter of 1888, the government is vested in a mayor and city council elected every two years. Ithaca was first settled in 1787 and was called at different periods, «Sodom,» «The Flats,» and «the city,» until 1806, when Simeon Dewitt gave it the name it bears. It was incorporated as a village in 1821. Pop. (1890) 11,097; (1900) 13,136.

Ito, Hirobumi, hē-rō-boo'mē ē'tō, **Marquis,** Japanese statesman; b. in Choshiu province, 1840. When the officer of the deck of the United States S. S. Mississippi, at midnight on 25 April 1854, heard the cry «American, Amer-

MARQUIS HIROBUMI ITO,
Ex Premier of Japan.

ican!" he found two Japanese gentlemen who had blistered their hands in rowing a fisherman's boat from the shore to get on board the American warship, hoping to be taken to America. Their clothing was stuffed full of writing paper and materials on which they expected to note down what they saw in foreign countries. One of these was Yoshida Shoin, who had long believed in breaking up the hermit policy of Japan and opening his country to human intercourse. Against his own sympathies, and despite their piteous appeal, Commodore Perry, keeping his word of honor, put the two men ashore. Seized as a prisoner, Yoshida was kept in domiciliary confinement in Choshui for five years, finally suffering decapitation and political martyrdom in Yedo, 31 Jan. 1859. He had for his pupils Ito Hirobumi and Inouye Kaoru. Thus early instructed, Ito determined to see the great world. Getting secretly on board a foreign ship, he reached Shanghai. While his other companions went to Europe by steamer, he and Inouye worked their way before the mast. In London he saw and learned much amid varied experiences, meanwhile making up his mind that Japan must change her entire civilization, cease being Oriental and become modern, or else go the way of India and the conquered Asiatic nations. Hearing that his feudal lord, having erected batteries commanding the straits of Shiminoséki, was about to defy the combined fleets of Great Britain, France, Holland, and the United States, he hastily left for Japan, but at home his efforts did not prevent that bombardment of 5 Sept. 1864 which so enlightened the eyes of the Choshui men, leading them to sink their clan feuds and join with Satsuma, Tosa, Echizen, and others for the restoration of the emperor's power and the unity of all Japan. Active as one of the younger men in the revolution of 1868, he saw the necessity of a uniform coinage. Visiting the United States, he studied American financial history, and on his return the decimal system of money and a mint at Osaka were established. He was one of the first to propose the abolition of feudalism, and in 1872–3 went round the world in the embassy to obtain from the Powers revision of the treaties. As minister of public works he established a college of engineering and secured the building of the railway from Yokohama to Tokyo. After serving as head of the Home Office he visited Europe in 1876 to study the constitutions of the various countries with the idea of forming a written constitution, in fulfilment of the emperor's oath of 1868 to create representative government. He became an intense admirer of the Bismarckian methods and system, and on his return inaugurated a radical plan for altering social customs. As minister president of state, he reconstructed the government, eliminating men of the older traditions and putting in men of modern training. He carried out drastic reforms in economy, besides reconstructing law and codes which, departing widely from those hitherto built on Chinese models, were made in harmony with the jurisprudence of Western countries. In 1888 there was a conservative reaction, and Ito retired to prepare, with three others, the constitution, which was finally promulgated 11 Feb. 1889. Though astonishingly liberal in matters of conscience and personal liberty, it follows the Prussian model in making the ministers responsible not to the Diet but to the emperor, against which provision the Liberals, eager to follow American and English precedents, have made unceasing protest. This struggle is the key to Japanese politics. Ito wrote a volume of commentaries on the constitution, translated into English by Ito Myoji. Again called to the premiership, he averted a political crisis at home and directed the diplomacy of the Chino-Japanese war of 1894–5. Resigning the premiership, he traveled in Europe, and on his return was again called by the emperor to form a government, and besides working for the Anglo-Japanese alliance, sent 21,000 fully equipped soldiers to join the allies and relieve the legations at Peking. In 1901, after the fall of his "coalition cabinet," he was succeeded by Katsura and went abroad for travel. In the United States for health, he received at Yale University the degree of LL.D. In 1904 he was the emperor's special envoy in Korea to consummate the alliance of the two countries. Enjoying the full confidence of his sovereign, he is, despite his opportunist proclivities, probably the best all-round statesman in Japan's modern history, incarnating, as he does, her past, present, and future.

WILLIAM ELLIOT GRIFFIS,
Author of 'The Mikado's Empire.'

Iturbide, ē-toor-bē'dā, **Augustin de,** emperor of Mexico: b. Valladolid de Michoacan (now Morelia), Mexico, 27 Sept. 1783; d. Padilla, State of Tamaulipas, 19 July 1824. In 1810 he was lieutenant in the provincial regiment of his native city, but on the breaking out of the troubles in Mexico joined the royalist party, and in this cause displayed such valor and ability that in 1816 he rose to the command of what was called the northern army, which occupied the provinces of Guanaxuato and Valladolid. In 1820 the imprudent acts of the Spanish cortes produced so much exasperation among the clergy and the partisans of absolutism in Mexico, that these persons united to effect the independence of their country, selecting Iturbide as their agent, and appointing him commander of the army in the south. He quickly bore down all opposition, and became so popular that he had himself proclaimed Emperor of Mexico, in July 1822, under the name of Augustin I. The Congress declared the throne hereditary in his family, and voted him a yearly allowance of $1,500,000. His troubled reign came to an end in less than a year, by his abdication in March 1823. Congress granted him on his abdication a yearly pension of $25,000 on condition of his leaving the country, making sufficient provision for his family in case of his death. He resided in Leghorn for about a year, when he was induced to make an attempt to recover his lost crown. He landed with but a single attendant at Soto la Marina, and was arrested and shot. His family settled in Philadelphia, where his widow died in 1861. Several of his sons subsequently held positions under the Mexican government, the eldest, Prince Angel, dying in the City of Mexico in 1872, the youngest, Prince Augustin, dying in Paris in 1873. Prince Angel's son, Augustin, b. 1864, was adopted by the Emperor Maximilian as his heir, Maximilian himself being childless. The collapse of the second empire, however, destroyed his chances of a throne.

Iuka, Miss., a small village on the Memphis & Charleston railroad, in the northern part of the State, about 115 miles east of Memphis, was the scene of a severe engagement during the Civil War. Early in September, 1862, it was occupied by a small Union regiment as an outpost. On the morning of 13 September Gen. Sterling Price, moving north from Tupelo with a force of 14,000 men, to prevent Grant from sending reinforcements to Gen. Buell in Kentucky, drove the Union regiment from the village and occupied it, and on the 19th was about moving to Rienzi on the Mobile & Ohio Railroad to form a junction with Earl Van Dorn's army preparatory to an attack upon Corinth. Gen. Grant had been closely watching the movements of Price and Van Dorn, and when he heard that Price had occupied Iuka he determined to attack and cut him off before he could effect a junction with Van Dorn. Gen. Rosecrans, who was near Corinth with 9,000 men, was ordered to move south to Rienzi and Jacinto, then eastward, and, marching on the roads from Jacinto and Fulton, to attack Iuka from the south. Gen. Ord, with 6,500 men, was to move along the Memphis & Charleston Railroad to Burnsville, thence by roads north of the railroad, and to attack on the north and west of Iuka. Grant accompanied Ord, who reached Burnsville on the 18th, and encamped within six miles of Iuka, which he proposed to attack early in the morning; but Grant, hearing that Rosecrans had been delayed in his movements and would not probably be up in time to attack next day, instructed Ord not to move to the attack until the sound of Rosecrans' guns was heard south of Iuka. Rosecrans, with the two divisions of Hamilton and Stanley, moved from Jacinto at 5 o'clock in the morning of the 19th and, after a march of 18 miles, at 4 P.M. his advance division (Hamilton's), about two miles south of Iuka, encountered Little's division of Price's command, Maury's division remaining in the north of Iuka, to confront Ord. Little had about 4,000 men, with which he attacked Hamilton vigorously before the latter could complete his lines. After a very severe fight, Hamilton was driven back some 600 yards, abandoning nine guns; but, receiving three regiments of Stanley's division as a reinforcement, he rallied and regained part of his lost ground, when darkness ended the fighting. Gen. Price reports: "The fight began, and was waged with a severity I have never seen surpassed." Price prepared to renew the battle in the morning; but, convinced by his subordinates of the critical position he was in with Rosecrans in his front and Ord in rear, retreated southward by the Fulton road, which Rosecrans had failed to close as was intended. Ord did not hear the sounds of battle on the 19th, but, advancing on the morning of the 20th, found that Price had escaped. Price retreated southward and reached Baldwyn 23 September. Rosecrans and Ord returned to Corinth. Rosecrans reported a loss of 144 killed, 598 wounded, and 40 missing. Price reported a loss of 86 killed and 408 wounded; Union estimates placing it much higher. Consult: 'Official Records,' Vol. XVII.; Greene, 'The Mississippi'; the Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. Carman.

Ivan, ē-vän', the name of several rulers distinguished in Russian history. The most celebrated are the Grand Dukes Ivan III. and Ivan IV., who laid the foundations of the Russian Empire, the latter (b. 1529; d. 1584) being commonly known as Ivan the Terrible. (See Russia.) Ivan VI. was son of the Grand-princess Anna and of Antony Ulrich, duke of Brunswick-Wolfenbüttel. The Empress Anna, 1740, declared him her successor, and her favorite Biron was to be his guardian and regent. Biron caused the oath of allegiance to be taken to the prince, and when he was banished the parents of the child assumed the reins of government until the daughter of Peter I., Elizabeth, ascended the throne. The young Ivan was taken from his cradle by soldiers, and shared the fate of his banished and imprisoned parents.

Ivanhoe, the title of one of Sir Walter Scott's most famous novels, written and published in 1819. The manuscript is now at Abbotsford. Immediately after its appearance, 'Ivanhoe' became a favorite, and now ranks among the most brilliant and stirring of romantic tales. The scene of the tale is England in the reign of Richard I.

Ives, īvz, **Brayton**, American financier: b. Farmington, Conn., 1840. He was graduated from Yale in 1861, served in the Union army in the Civil War, attaining the rank of colonel, 5th Connecticut infantry, and brevet brigadier-general, in 1867–89 was a broker of New York, and in 1878–9 president of the New York Stock Exchange. At one time president of the Northern Pacific railway, he later was chosen to the presidency of the Metropolitan Trust Company of New York.

Ives, Frederic Eugene, American inventor: b. Litchfield, Conn., 17 Feb. 1856. He received a public school education; was director of the photographic laboratory at Cornell University in 1874–8, and has lectured before scientific societies in this country and in England. Among his inventions are the process of half-tone photo-engraving (1878); and the three-color printing process in the typographic press. He has published: 'Isochromatic Photography with Chlorophyll' (1866); 'A New Principle in Heliochromy' (1889); etc.

Ivory, properly the substance of which the tusks of the elephant consist, though the similar substance constituting the tusks of the hippopotamus and the horn of the narwhal is also so called. There is also a wholly different substance known as vegetable ivory (q.v.). Ivory is prized for its beautiful color, the fineness of its grain, and the high polish it is capable of receiving. That of the African elephant is most esteemed by the manufacturer for its density and whiteness. It is used as a material for knife-handles, pianoforte keys, combs, the backs of brushes, billiard balls, chess-men, carved figures, and ornamental articles of various kinds. Thin plates of ivory are used as panels for miniature paintings, and etchings are sometimes executed on such plates. The ivory of the hippopotamus is preferred by the dentist. The shavings and sawdust of ivory, by burning in a crucible, are converted into a black powder, from which is prepared a pigment known as ivory black. Ivory may be stained or dyed. The use of ivory was well known in very early

ages. The ancients were acquainted with the art of sculpturing in ivory, of dyeing and inlaying it, and they often employed it in statuary. Some of the most famous Grecian statues were chryselephantine, that is, were overlaid with plates of gold and ivory in conjunction. To provide the world's supply of ivory it is estimated that 9,000 to 12,000 elephants are killed annually. The medium weight of a tusk is about 60 pounds, but some are found weighing as much as 170 pounds.

Ivory-bill, the great black-and-white, scarlet-crested woodpecker (*Campephilus principalis*), formerly numerous and greatly admired throughout the Southern States, but now surviving only in a few of the most secluded cypress swamps of the Gulf coast. Its extermination was begun by the Indians, who valued highly its splendid head-feathers as an ornament for warriors; and completed by sportsmen and plume-hunters. The books of Wilson, Audubon and early writers on American animals give many interesting facts as to its habits.

Ivory Palm, a South American palm-tree yielding corozo-nuts,—large white seeds called "vegetable ivory" (q.v.).

Ivory, Vegetable. See VEGETABLE IVORY.

Ivy, a popular name for various climbing, creeping, and drooping herbs and shrubs, the most widely known of which are the following: Common or English ivy (*Hedera helix*) is a tall climbing evergreen shrub of the order *Araliaceæ*, widely planted in Europe (where, as in Northern Africa and Eastern Asia, it is native), and in the warmer parts of the United States, its ornamental, abundant foliage being highly valued for covering walls, rocks, and trellises. Its small and inconspicuous greenish, perfect flowers appear late in the autumn and the small black fruits (three to five seeded berries) ripen the succeeding year. The fruits, which are devoured by birds, are bitter and pungent, and were formerly in medicinal repute, The gummy juice obtained from the stem, as also the fruit, contains the bitter principle hederin and the hederic acid characteristic of the plant. It has been used in making varnish. Contrary to popular opinion, ivy is not parasitic upon such trees as support it. It merely clings to them by its numerous hold-fast roots produced along the entire length of its stems. Such trees as it injures are killed by constriction. The other popular notion that it makes the walls and houses upon which it climbs damp and unhealthy is also erroneous; in reality it dries them, the roots abstracting such water as reaches the wall through the dense foliage; yet exceptional cases of damage occur. It has numerous horticultural varieties which differ mainly in the form, color and markings of the leaves. These succeed best in rather moist, rich soils and shady positions and are not usually found to be hardy much farther north than New York unless well protected from the winter sun, as upon the north side of buildings, etc. As a cool greenhouse and a house plant it is very popular. Ivy leaves and ivy berries were formerly administered for various medicinal purposes, but they have been long out of use. The leaf and habit of the common ivy are so characteristic that reference is often made to them in the specific names of other plants, "ivy-leaved" being common as a designation. The plant takes a prominent place in mythology and folk-lore.

Japanese or Boston ivy (*Ampelopsis tricuspidata*) and its near relative Virginia creeper (*A. quinquefolia*) of the order *Vitaceæ*, are probably the next best known species to which this name is applied. The former is the more graceful, and is gradually gaining in general favor over the latter, which demands more attention to keep it looking presentable. Both climb by means of tendrils, but the Boston ivy clings better to walls. It has three-lobed leaves; its rival, five-lobed. Both have brilliant autumnal colors in the north, where the Virginia creeper is the more hardy.

Among the herbaceous ivies Kenilworth ivy (*Linaria cymbalaria*), German ivy (*Senecio mikanoides*) and ground ivy (*Nepeta glechoma*) are best known in America. They are all popular greenhouse plants and are frequently planted in hanging-baskets because of their graceful habits. Poison-ivy or poison-oak is a climbing sumach whose leaflets somewhat resemble those of Virginia creeper, but are in threes instead of fives (see POISON-IVY).

Iwakura, Tomomi, Japanese reformer and statesman: b. in Kioto in 1825 of illustrious ancestry, one of the Kuge or court nobility, chamberlain of the imperial household, and at first in favor of the expulsion of foreigners. He never saw a foreigner until he was 43 years old. Becoming a Progressive, he was banished into exile and shaved his head, but his real aim was to restore the lustre of the imperial throne by the overthrow of the Yedo Shogunate. Entering into communication with the leaders of the confederation of southern daimios, he became the link between court nobility and the progressive samurai or gentry, and took a prominent part in the Restoration of 1868. He was one of the first to send his three sons to be educated under Verbeck and to America. He received high office and salary, and in 1870, as envoy of the mikado to the recalcitrant Satsuma leaders, led in the movement to abolish feudalism, and was prominent in securing the formation of a new national army. As minister of foreign affairs and junior premier, he was visited by his sovereign. He went to Europe and America as head of the great embassy of 1872. He admired greatly the government at Washington. He left a powerful impress on the nation and the sovereign, and received the highest honors due to a subject. Escaping all attempts at assassination, he died quietly in his bed 20 July 1883. Of his children, a son, Prince Iwakura Tomosada, of the House of Peers, is special attendant upon the emperor, and the other, a daughter, is at the head of the Red Cross work in Japan.

WILLIAM ELLIOT GRIFFIS,
Author of 'The Mikado's Empire.

Ixion, ĭks-ī'ŏn, in Greek mythology, king of the Lapithæ in Thessaly, son of Phlegyas. He married Dia, daughter of Deioneus. He became enamored of Hera, and attempted to seduce her. Zeus made a cloud in the shape of Hera, and carried it to the place where Ixion had appointed to meet her. Ixion was caught in the snare, and from his embrace with the cloud were born the Centaurs. (See CENTAURS.) Zeus banished him from heaven;

struck him with his thunder, and ordered Hermes to tie him to a winged or fiery wheel in Hades.

Iyar, the eighth month of the Jewish year, corresponding, at the earliest, with April; but it may be as late as May; it has only 29 days.

Iz'ard, George, American general: b. Richmond, Surrey, England, 1777; d. Little Rock, Ark., 22 Nov. 1828. He was a son of Ralph Izard (q.v.). He was graduated from the College of Pennsylvania in 1792, and after a tour in Europe was appointed in 1794 a lieutenant in the regiment of artillerists and engineers in the United States army. Upon the breaking out of the War of 1812 with Great Britain he served as colonel of the 2d artillery, and was successively promoted to be brigadier-general and major-general. At one period of the war he held chief command of the northwest frontier. In 1825 he became governor of Arkansas Territory, in which office he died.

Izard, Ralph, American statesman: b. near Charleston, S. C., 1742; d. South Bay, near Charleston, 30 May 1804. He was educated at Christ's College, Cambridge, England, and, inheriting an ample fortune, established himself in 1771 with his family in London, whence the troubled condition of American politics induced him in 1774 to retire to the continent. He subsequently endeavored to impress upon the British ministry the ill-advised nature of the course they were pursuing, but without effect. In 1780 he returned to the United States, and found occasion to serve the country in various ways, having been instrumental in procuring the appointment of General Greene to the command of the southern army, and having once pledged his whole estate as security for funds needed in the purchase of ships of war in Europe. In 1781 he entered the Continental Congress, of which he remained a member until the peace; and upon the adoption of the Federal constitution he was elected a United States senator from South Carolina. As a legislator he was able and eloquent and in the senate possessed the confidence of all parties. The 'Correspondence of Ralph Izard from 1774 to 1804, with a Short Memoir,' was published by his daughter (1844).

Izard, the chamois (q.v.); so called in the Pyrenees.

J

J the tenth letter of the English alphabet, was unknown to the ancient Latins and Greeks as an alphabetic character and representative of a vocal sound.

Till the 16th century the Latin and other alphabets of western Europe had only the letter i to represent both the vowel sound i and the consonant sound now represented by j: at least in fonts of type of that century, and till the end of that century or later, the character i served to represent both the vowel and the consonant, though a distinction was made between them in manuscripts of the previous century by continuing the stroke of the i a little below the line when it stood for the consonant. This letter j from the first represented in English the sound of dzh, in French that of zh; in German and other languages its value is that of the consonant y; for example, Julius, pronounced yulius, jacio, pronounced yacio.

For speakers of the modern European languages the j in Latin has usually the same value as in their native tongues. But though for Spaniards j in Latin is equal to y, in their own speech j is a strong guttural aspirate that might be represented in English by kh. The sound of j in English is always represented in Italian by g: the French and English journal is in Italian *giornale*, the Latin *judex*, English judge is in Italian *giudice*.

The sound of dzh is represented in English not only by its proper letter j, but also by g and by dg: jest, gem, edge.

Jabiru, jab'ĭ-roo, a large species of stork (*Mycteria americana*), somewhat resembling the adjutant, found nearly throughout South America and northward into Mexico and Texas. It is about five feet high, with stilt-like legs, and massive, slightly upcurved beak; the plumage is white and the naked head and neck black. In habits it resembles the other storks (q.v.). Several related Oriental species have received the same name.

Jaborandi, a Brazilian shrub (*Pilocarpus pennatifolius*) of the order *Rutaceæ*, which yields a volatile oil from which is derived a principle (pilocarpin) in the form of an amorphous white powder having properties similar to atropine. It is the basis of the drug jaborandi, which is diaphoretic and sialagogic in its effects. Other "jaborandis" are obtained from species of *Serronia*, *Aubletia* and *Piper*.

Jac'amars, a group of small, gaudy, South American birds of the family *Galbulidæ*, and related to the puff-birds and woodpeckers. Their plumage is highly colored, reds and bronzy greens and blues predominating. They live mostly along the outskirts of forests, and feed upon large insects caught in flight. White eggs are laid in holes in earthen banks; and a whistling song is given during the breeding season.

Jaçanas, zhä-sä'nä or jă-kā'na, a group of birds (*Parridæ*) related to the rails, and remarkable for the extraordinary length of the toes, which are further extended, especially the hallux, by long, slender claws. There are four genera and about a dozen species, most of which inhabit the Old World — Africa, India, and Australia. The genus *Parra* is American, and one Mexican species (*Parra spinosa*) enters Texas. The beak is plover-like and the bend of the wing bears a stout and acute horny spur; the plumage is of a rich purplish brown with the wings green and black. The great spread of the toes enables these birds to walk with ease on the floating leaves of water lilies and similar plants, otherwise their habits are much like those of rails (q.v.).

Jacaran'da, a genus of tropical American trees of the Bignonia (q.v.) family. One (*B. brasiliana*) yields the wood called jacaranda wood, or blue ebony, which is very hard and capable of receiving a fine polish. The name is carelessly applied to several other South American woods used in cabinet-work.

Jacaré, zhä-kä-rā' or jăk'a-rĕ, a South American name for an alligator of the genus *Caiman*, of which the large black species (*C. niger*) reaches a length of 20 feet and is called on the upper Amazon jacaré-nassu, while the jacaré-tinga (*C. trigonatus*) is only six feet long, and has a slender muzzle and black-banded tail. See CAYMAN.

Jack, a pike; in the United States, the common eastern pickerel (q.v.) is most usually meant. The wall-eyed pike (q.v.) is called "jack salmon" in some parts of the West. Several marine fishes are known as jack fish, amber jacks, etc., especially among the lively sea-bass, groupers, amber-fish and the like. The term, as in other cases, implies a quality in the animal exciting friendly interest and admiration.

Jack, or **Jack-tree** (native name *Jaca*), a tree (*Artocarpus integrifolia*), related to the bread-fruit (q.v.), a native of India and south-eastern Asia. The fruit grows to a larger size than the bread-fruit of the Southern Pacific islands, often weighing more than 30 pounds, and containing from 200 to 300 seeds, each of them four times as large as an almond. The seeds or nuts are eaten after being roasted or boiled, and the sweet fleshy pulp of the fruit is also eaten. When the tree is young the fruit

grows from the twigs; in middle age it grows from the trunk; and when the tree gets old, from the roots. It forms a great part of the food of the natives in some portions of India, Ceylon, etc. The yellowish timber is used for almost every purpose, being strong and ornamental, and yields a yellow dye.

Jack and the Beanstalk, an English nursery tale relating to the heroism of a boy. Its analogue occurs in many national folk-lore legends. It is supposed to represent in a figure the restoration to the earth of those fertilizing and elemental activities, which are necessary to human life. The harp is the wind, which drives the ships and turns the mills to grind the wheat. The bags of treasure are the raindrops that scatter wealth and plenty. The red hen is the sun that brings life to birth by its fostering heat.

Jack and Jill, the first words of an old nursery rhyme, of considerable folk-lore interest. Jill is a corruption of the French Julienne, once common in England under the form Gillian. It also appears in the legend of St. Kilian, where Geilana vindictively causes the good bishop's death. This incident of Jack and Jill is probably based on one of the moon myths of Scandinavia. The Norse peasant sees in the spots on the moon the two children rescued by the moon from their father, who had forced them to draw water all the day.

Jack the Giant Killer, the hero of an English nursery story, which reflects triumph of skill over strength and bulk such as makes the point of the story in David and Goliath, Ulysses and Polyphemus, etc. The English form is based upon the legend that St. Michael's Mount, in Cornwall, was once the fortress or castle of a giant, who was dislodged by the valor of an English knight. In adapting the story so as to claim the sympathies of children the knight is made to take the shape of a child.

Jack Horner, the first words of an old nursery rhyme. The rhyme is said to be based on a historic fact. Horner was the messenger whom the abbot of Glastonbury sent to Henry VIII. with the deeds of certain manors involved in the dissolution of monasteries. Horner obsequiously handed the parcel to the royal spoliator, but first of all managed to abstract the deeds of the manor of Welis, a "plum" indeed, and the abbot was afterward punished on the charge that he had withheld them.

Jack-in-the-Pulpit, or **Indian Turnip,** a perennial herb (*Anisæma triphyllum*) of the arum family (see *Araceæ*). Its name is derived from its spadix, which is upright, with the spathe surrounding and arching over it, suggesting a preacher in an old-fashioned pulpit with a sounding-board. It is common in the United States, east of the great plains, in damp, shady woods and in moist garden soil; and when the spathe falls away in early summer, the red berries are prominently shown in the form of a dense ovoid head. Its acrid tuber or corm is valued for its medicinal properties, and may be made edible by boiling.

Jack-snipe, a gunner's term for a shore-bird, also called grass or meadow snipe, which is in reality a sandpiper, named in books the pectoral sandpiper (*Tringa maculata*). The perversion of names is due to its somewhat game-like habits of lying to a dog and flushing correctly from the grass, like a true snipe which render it an attractive object of pursuit; beside which, in the fall it becomes very fat, and it is then excellent eating. Unlike most sandpipers, it does not flock, at least to any extent, being oftenest found scattered singly or in pairs. In the United States it is chiefly, if not wholly, a bird of passage, breeding in Canada and wintering in the tropics. It is nine inches long, clay-colored, striped with blackish above; breast ashy and sharply streaked; belly white. Consult authorities mentioned under shore-birds.

The English "jack-snipe" is a true snipe (*Gallinago gallinula*) of very small size, and therefore also known as "half-snipe."

Jack'al, a small active wild dog or wolf of the warmer regions of the Old World, found in southeast Europe, Africa, Syria and southern Asia. The common jackal averages about 2 or 2½ feet in length, and about 14 inches in height, with a bushy tail about 8 inches long. The eyes are small, and the pupil is round. The general color of the body is a dirty yellow or brown, lighter on the throat and belly. Jackals inhabit holes and burrows whence they come forth in the evening to hunt in packs. Their cry consists of a series of prolonged howls, followed by shorter yelps, much like that of the American coyote. The jackal subsists largely upon carrion, often that left after the repast of the fiercer and larger carnivora; but it also kills prey for itself, a pack hunting down antelopes, deer, or other animals, besides getting much small fare, as mice, lizards, insects and the like. They also eat certain kinds of vegetable food, and sometimes they do considerable damage to sugar and other plantations. The jackal is susceptible of being tamed, but its odor makes it by no means a desirable domestic animal. It is believed to be exceedingly cunning, and in many Eastern tales, especially among the people of India, plays exactly the same part as the fox does in those of Europe. It is probable that jackals have contributed frequently to the commingled stock represented in our domestic dogs, some of which betray very jackal-like points. They inter-breed with domestic races.

The common jackal (*Canis aureus*) is the most widely distributed species; but another species, found mostly in southern Africa, is the blackbacked jackal (*C. mesomelas*). This latter form has the back and end of the tail black, the other parts mostly red or yellowish-red. A third species of jackal found in South Africa is the canduc (*C. adustus*), marked by a light stripe on the sides. Consult: Mivart, 'Dogs, Jackals, Wolves and Foxes' (London 1890).

Jackass Kingfisher, or **Laughing Jackass,** the name of a large inland kingfisher (*Dacelo gigas*) of Australia, given by the colonists in allusion to its loud, hoarse cry. It is about 17 inches long, brown in general color, does not frequent water or catch fish, but lives on insects, small reptiles, etc., and lays its eggs in a hole in a tree.

Jack'daw, a small, black European crow (*Corvus monedula*), with black legs and feet

1. Common Jackal. 2. Side-striped Jackal.

and grayish neck. They inhabit towers, spires, and like elevated situations, and even in towns and populous cities are present and breed freely. The nests and eggs are like those of other crows (q.v.) which they resemble in general habits. Jackdaws are easily tamed, learn to pronounce many human words, and are most amusing pets, but are mischievous and thieving, like magpies.

Jack'man, Wilbur Samuel, American educator: b. Mechanicstown, Ohio, 12 Jan. 1855; d. 28 Jan. 1907. He studied at Allegheny College (Meadville, Pa., 1880–2), was graduated from Harvard in 1884, and later became dean of the school of education in the University of Chicago, and head of the natural science department of the school. In 1899–1900 he visited Holland, France, and Germany for the study of educational methods. Besides many articles on pedagogical topics, he published: 'Nature Study for the Common Schools' (1891); 'Number Work in Nature Study' (1893); 'Field Work in Nature Study' (1894); 'Nature Study Record' (1895); 'Nature Study and Related Subjects' (1898); and 'Nature Study for the Grammar Grades' (1898).

Jackrabbit. See HARES.

Jack'son, Abraham Valentine William, American Indo-Iranian scholar: b. New York 9 Feb. 1862. Graduated from Columbia in 1883, he was Fellow in letters there (1883–6), instructor in Anglo-Saxon and the Iranian languages (1887–90), and, after study at Halle (1887–9), adjunct professor of English language and literature (1891–5). In 1895 he was appointed professor of Indo-Iranian languages at Columbia. By way of recognition of the instruction given by him in their ancient books, the Parsees made to the Columbia library the gift of an important manuscript collection of Zoroastrian works. He appeared also as a public lecturer, became one of the directors of the American Oriental Society, and in addition to numerous contributions to the 'Journal' of that society and other learned periodicals, wrote: 'A Hymn of Zoroaster, Yasna XXXI.' (1888); 'An Avestan Grammar' (1892); 'An Avestan Reader' (1893); 'Zoroaster, the Prophet of Ancient Iran' (1899).

Jackson, Abraham Willard, American Unitarian clergyman and author: b. Portland, Maine, 7 April 1843. He was graduated from Colby University (Waterville, Maine), entered the Union army as private in the 8th Maine volunteers, became captain in the 33d United States colored troops, in 1872 became pastor of the Unitarian Church at Peterboro, N. H., and subsequently of that at Santa Barbara, Cal. In 1894–5 he was acting professor of philosophy in the Meadville Theological School. Among his writings are: 'The Immanent God' (1889); 'James Martineau: a Biography and Study' (1900); 'Deafness and Cheerfulness' (1901).

Jackson, Andrew, seventh President of the United States: b. Waxhaw settlement, N. C., 15 March 1767; d. near Nashville, Tenn., 8 June 1845. He was of north of Ireland ancestry, his father emigrating to America from Carrick Fergus in 1765. As a boy Jackson was reckless, impetuous, quarrelsome, and passionate in temper; thoroughly disinclined to learning of any sort, his favorite pursuits were racing, gaming, and cock-fighting, but he was possessed of invincible determination, dauntless courage, and excelled in marksmanship and riding, qualities which later served him well. After some desultory law study in Salisbury, S. C., he became in 1788 public prosecutor of the Western District of North Carolina (that is Tennessee). In 1791 he married Rachel Robards, both supposing the latter's husband, Lewis Robards, had secured a divorce by act of the Virginia legislature. This proving not to be the case, they were remarried in 1794. This incident was frequently used against Jackson in his political campaigns, but his only fault was in not ascertaining more surely the exact terms of the Virginia act. A member of the Knoxville convention which drafted a constitution for Tennessee, Jackson was elected the first Federal representative of that State after its admission to the Union, June 1796. Appointed U. S. Senator in 1797 he resigned in April 1798 to become judge of the Tennessee supreme court, holding the position until 1804 when he retired to devote himself to settling his private affairs which had become heavily involved in debt. Between 1806–11 he led the life of a planter, storekeeper and private citizen without noticeable incident. Upon the outbreak of the war of 1812 Jackson, then major-general of Tennessee militia, promptly offered his services with those of 2,500 volunteers. New Orleans being considered a probable objective of the enemy, Jackson was sent there, 7 Jan. 1813, but was soon ordered to dismiss his troops and return. Thoroughly enraged, he hired transportation on his own authority and marched his men home in a body, refusing to disband them without pay or rations, five hundred miles fro home. In June the government reimbursed him for the expenses incurred. It was during this expedition his soldiers bestowed on him the affectionate name of "Old Hickory." On 30 Aug. 1813, the massacre of the garrison and refugees at Fort Mims, at the junction of the Alabama and Tombigbee rivers occurred. Tennessee at once voted men and money to aid in suppressing the Indian outbreak. Jackson, though one arm was badly wounded from a pistol-shot, took the field, and in a whirlwind campaign completely crushed the Creeks at Horseshoe Bend, Alabama, 27 March 1814. On 14 March 1814, he ordered John Wood to be shot for insubordination and assaulting an officer, the first of the military severities afterward brought up against Jackson during his Presidential campaigns. On 31 May 1814 he was appointed major-general of the United States army, commanding the department of the South. In November, without orders from Washington he marched against the English at Pensacola, easily stormed the town and compelled their withdrawal. Proceeding to New Orleans he began energetic preparations for its defense, amid the greatest difficulties and wholly lacking in proper means and materials. On 23, 28 Dec. 1814 and 1 Jan. 1815 he gained minor successes against the British. On 8 Jan. 1815, General Pakenham with 10,000 veteran troops delivered a grand assault upon Jackson's works. The result was a complete defeat and rout of the British, they losing over 2,600 in killed, wounded and prisoners, while Jackson's loss was seven killed and six wounded. The treaty of peace

had been signed at Ghent 24 Dec. 1814, but Jackson did not learn of it until 6 March 1815. Accordingly he relaxed none of his vigilance, but kept the city under martial law, during which his characteristic highhandedness brought him into sharp conflict with the civil authorities. For disciplinary reasons six soldiers were court-martialed and shot on 21 February. But Jackson's brilliant and unexpected victory, the one great land success of the War of 1812, set the country afire with enthusiasm. From an obscure planter he immediately became the most popular man in the country. Resolutions of thanks and praise poured in on him from State legislatures; Congress voted him its thanks and a gold medal, and his exploit was the political salvation of the tottering administration. During the Seminole war Jackson was ordered to take command in Georgia, December 1817. Within five months he broke the Indian power completely, established peace on the border, and practically conquered Florida. His hasty measures, undertaken on inadequate facts and information, caused considerable anxiety and discussion in the government. His invasion of Florida and capture of St. Marks, a Spanish possession, and his summary execution of Arbuthnot and Ambrister, two British subjects, seemed likely to raise delicate diplomatic situations. Upon the acquisition of Florida Jackson was appointed its first territorial governor, April 1821, with almost the powers of a Spanish captain-general, but, disgusted with the office, he resigned in October. Parton describes his conduct while governor as "arrogant and disgraceful." In 1823 he declined the mission to Mexico, and was an unsuccessful candidate for the presidency in 1824. But in 1828 backed by the powerful influence of Van Buren in New York and his own popularity in Pennsylvania, which thus assured him the support of the two largest eastern states, Jackson was triumphantly elected President, the first representative of the new West and the masses. In 1832 he was re-elected by a larger electoral vote than in 1828. His first cabinet was composed of almost unknown men. For advice and counsel he relied chiefly on a group of personal friends and intimates, among them being Wm. B. Lewis, Amos Kendall, a representative of all that was vicious in American political methods, Duff Green and Isaac Hill, partisan editors, and later Francis P. Blair, who edited the 'Globe' in Jackson's interest. This group formed what came to be known as the "Kitchen Cabinet." In 1830 Jackson endeavored without success to enforce the social recognition of the wife of his secretary of war, John H. Eaton. The chief features of his administrations may be briefly summarized. That to him is due the shackling of the spoils system upon the country may be seen from the fact that between 1789 and 4 March, 1829, there were only 74 removals from office, while during Jackson's first official year there were some 2,000. He vigorously opposed the second bank of the United States, and vetoed the bill renewing its charter, 1832. He put a prompt end to South Carolina's nullification proceedings by his proclamation of 10 December 1832, declaring nullification contrary to the Constitution and incompatible with the existence of the Union, and his active preparations to execute the laws, by force if needful. In 1834, as a result of his action in ordering the secretary of the treasury to cease making deposits of government funds in the Bank of the United States, the Senate censured him for usurpation of powers not conferred by the laws or Constitution. His Specie Circular of 11 July 1836 directing that only gold and silver be taken at the land offices in payment for public lands was an important factor in the causes leading to the financial crash of 1837. His foreign policy was firm and successful. The disputes with Great Britain over the northeast boundary and the trade between the United States and British colonies, and with France over the indemnity for spoliations committed on American commerce early in the century, were dealt with shrewdly and with success.

Opinions will always be divided regarding Jackson's character. For thirty years he was a popular idol and the typical man of the "Fourth of July" period in American history. His countrymen easily forgave his faults and warmly admired his incontestable virtues. Extraordinarily illiterate, irascible in the highest degree, intensely patriotic, absolutely honest, terrible in the inflexibility of his purposes, faithful and devoted in his domestic life, a firm friend and implacable enemy, reckless and unflinching in the performance of what he conceived to be his duty, restless under any restraint calculated to hamper him in the discharge of that duty, an autocrat by nature yet a sincere lover of the common people,— such are some of the qualities which will always make Andrew Jackson one of the most picturesque figures in American history.

Bibliography.— Numerous biographies of Jackson exist. The best is still that by James Parton (3 vols., New York 1861); the life by Prof. W. G. Sumner in the 'American Statesman Series' is a careful study of his career as a public man (Boston 1883); the lives by John H. Eaton (Philadelphia 1817), and by Amos Kendall (New York 1843) have value as being written by men who knew him intimately. An excellent working bibliography for the study of Jackson's life and time will be found at the end of Professor Sumner's work.

W. N. C. Carlton,
Librarian, Trinity College, Hartford.

Jackson, Charles Thomas, American scientist: b. Plymouth, Mass., 21 June 1805; d. Somerville, Mass., 28 Aug. 1880. He was graduated at Harvard Medical College in 1829, and practised for a time in Boston. He claimed to have been the first to indicate, in 1832, the applicability of electricity to telegraphic use, and also claimed, in 1842, to have been the discoverer of the anæsthetic effects of the inhalation of ether. He received the monthly prize of 2,500 francs from the French Academy of Sciences in 1852. He published a 'Manual of Etherization, with a History of its Discovery' (1861), and several 'Reports.'

Jackson, Edward Payson, American educator and author: b. Erzerum, Turkey, 15 March 1840. He was educated at Amherst College; served in the Union army during the Civil War as private of the 45th and lieutenant of the 5th Massachusetts; was principal and superintendent of various educational institutions, and in 1877 was appointed master in the Boston Latin School. His works include:

ANDREW JACKSON.

SEVENTH PRESIDENT OF THE UNITED STATES.

'Mathematical Geography' (1873); 'A Demigod' (1886), a story published anonymously, and at first attributed to various well-known authors; 'The Earth in Space' (1889); and 'Character Building' (1892), to which was awarded a prize of $1,000, offered by the American Secular Union, jointly with N. P. Gilman's 'The Laws of Daily Conduct,' with which it was also published in the volume, 'Conduct as a Fine Art' (1894). He also became the editor of 'The Bohemian,' a Boston magazine of short fiction.

Jackson, Frederick George, English Arctic explorer: b. Alcester, Warwickshire, 1860. He was educated at Denstone College and the University of Edinburgh, made journeys across the Australian deserts and the Great Tundra of Siberia, in 1894–7 was leader of the Jackson-Harmsworth expedition to Franz Josef Land, and during the second Boer war was in command of a company of mounted infantry. During his stay in Franz Josef Land he mapped the region, which he proved to be a collection of islands, and made valuable magnetic and meteorological observations. He was awarded the gold medal of the Paris Geographical Society in 1899, and wrote: 'The Great Frozen Land' (1895); 'A Thousand Days in the Arctic' (1899).

Jackson, Gabrielle Emilie Snow, American writer for young people: b. New York 13 Oct. 1861. Among her many publications are 'Denise and Ned Toodles (1897); 'The Colburn 'Prize' (1899); 'Pretty Polly Perkins' (1900); 'Laddie and Lassie' (1900); 'Mother and Daughter' (1905).

Jackson, George Anson, American Congregational clergyman: b. North Adams, Mass., 17 March 1846. He was graduated from Yale in 1868, from the Andover Theological Seminary in 1871, was ordained to the Congregational ministry, and in 1872–97 held pastorates successively at Leavenworth, Kan., Southbridge, Mass., and Swampscott, Mass. In 1897 he became librarian of the General Theological Library of Boston. He wrote: 'The Apostolic Fathers' (1879); 'Fathers of the Third Century' (1881); 'Post-Nicene Greek Fathers' (1883); 'Post-Nicene Latin Fathers' (1883); 'The Son of a Prophet' (1894), a historical novel.

Jackson, Helen Maria Fiske Hunt, "H. H.," American novelist and poet: b. Amherst, Mass., 18 Oct. 1831; d. San Francisco, 12 Aug. 1885. At 21 she married Captain Edward Hunt (d. 1863) of the United States army, and began the wandering existence of an army officer's wife. From 1867 to her death, 16 years later, her pen hardly rested. She wrote verses, sketches of travel, essays, children's stories, novels, and tracts for the time, generally over the pen-name "H. H." Her life in the West after her marriage to W. S. Jackson, a banker of Colorado Springs, revealed to her the wrongs of the Indian, which she set herself at once to redress. Newspaper letters, appeals to government officialism, and finally her 'Century of Dishonor' (1881), a sharp arraignment of the nation for perfidy and cruelty towards its helpless wards, were her service to this cause. Her most popular story, 'Ramona,' (1884), a romance whose protagonists are of Indian blood, was also an appeal for justice. This book, however, rose far above its polemic intention; the beauty of its descriptions, its dramatic movement, its admirable characterization, and its imaginative insight entitling it to high rank. Two novels in the 'No Name Series'—'Mercy Philbrick's Choice' (1876) and 'Hetty's Strange History' (1877)—show the qualities that infuse her prose: color, brilliancy of touch, grace of form, certainty of intuition, and occasional admirable humor. She had not the gift of construction, and lacked the power of self-criticism; so that she is singularly uneven. It is no doubt chiefly her poems which have gained for "H. H." a place in literature. They reveal genuine lyrical power, although at times marred by defective technique. Among books of hers not already named are: 'Bits of Travel' (1873); 'Glimpses of Three Coasts'; 'Sonnets and Lyrics.' To her have often been attributed the noted 'Saxe Holm' stories.

Jackson, Henry Rootes, American diplomat and soldier: b. Athens, Ga., 24 June 1820; d. Savannah, Ga., 23 May 1898. He was graduated at Yale in 1839, admitted to the bar in Georgia and for several years was district attorney. He served in the Mexican War, became judge of the superior court, and in 1853 went to Vienna as *chargé d'affaires,* and the following year was made minister resident there. Before the outbreak of the Civil War he seceded from the Charleston Convention and, when his state seceded, commanded the state troops. He eventually resigned, and joined the Confederate forces. Near the close of the war he was made a brigadier-general in Hood's army and was captured with his whole command at Nashville after the battle of Franklin. In 1885 he was appointed United States minister to Mexico. He was the author of 'Tallulah, and Other Poems' (1850).

Jackson, Howell Edmunds, American jurist: b. Paris, Tenn., 8 April 1832; d. West Meade, Tenn., 8 Aug. 1895. He was graduated from the University of Virginia in 1854, from the law department of Cumberland University in 1856, began practice in Jackson, and later in Memphis, and upon the organization of the Confederate government became receiver for property in West Tennessee confiscated to the purposes of the Confederacy. Subsequent to the war he became a member of the court of referees of Tennessee, a tribunal which acted as a provisional supreme court in the hearing of cases that had arisen during the war period. Elected to the State legislature in 1880, he took his seat in the United States Senate in 1881, afterward left the Senate to become United States circuit court judge for the West Tennessee district, and in 1893 was appointed an associate justice in the United States Supreme Court.

Jackson, James, American soldier and statesman: b. Moreton Hampstead, Devonshire, England, 21 Sept. 1757; d. Washington, D. C., 19 March 1806. He emigrated to America with his father in 1772, and studied law in Savannah. In March 1776 he aided in repelling a British attack upon that town, and subsequently was appointed brigade major of the Georgia militia. In 1781 he aided in the capture of the fort at Augusta, and was left in command of

the place, and upon the evacuation of Savannah by the British in 1782 was appointed by General Wayne to receive the keys of the town. In 1789 he was chosen a representative in Congress, and from 1792 to 1795 was a member of the United States Senate. He had the principal share in the framing of the Georgia constitution of 1798, and upon its adoption was elected governor of the State, and held that office until his reelection in 1801 to the United States Senate.

Jackson, James, American physician, brother of Charles Jackson (q.v.): b. Newburyport, Mass., 3 Oct. 1777; d. 1867. He was graduated at Harvard College in 1796; studied medicine in London, and on his return to Boston in 1800 commenced practice there, devoting himself entirely to medical practice, to the exclusion of surgery and other branches. In 1803 he became a member of the Massachusetts Medical Society. In 1810, with Dr. John C. Warren, he brought before the community a proposition for establishing a hospital in the city of Boston. The first result of this was the organization of the asylum for the insane at Somerville, then included in Charlestown, and afterward of the Massachusetts General Hospital in Boston. Dr. Jackson was the first physician, and Dr. Warren the first surgeon, to this institution. In 1810 he was chosen professor of clinical medicine in Harvard, and in 1812 professor of theory and practice, becoming professor emeritus in 1835. His principal publications were: 'On the Brunonian System' (1809); 'Remarks on the Medical Effects of Dentition'; 'Letters to a Young Physician' (1855). Of the last work several editions were printed.

Jackson, Patrick Tracy, American merchant, brother of Charles Jackson (q.v.): b. Newburyport, Mass., 14 Aug. 1780; d. Beverly, Mass., 12 Sept. 1847. At the age of 15 he was apprenticed to a merchant of Newburyport, and subsequently established himself in Boston in the India trade, in which he acquired a handsome fortune. In 1812, at the invitation of his brother-in-law, Francis C. Lowell, who had recently examined the process of the cotton manufacture in England, he engaged in a project to introduce the power loom, then newly invented, and the mode of constructing which was kept secret, into the United States. After repeated failures they succeeded in 1812 in producing a model from which a machine was subsequently constructed by Paul Moody. In 1813 they built their first mill at Waltham, near Boston, the first in the world that combined all the operations for converting the raw cotton into finished cloth. In 1821 Jackson made large purchases of land on the Merrimack River near the Pawtucket canal, on which a number of mills were constructed by the Merrimack Manufacturing Company, a corporation organized under his auspices. This settlement formed the germ of the present city of Lowell. He procured in 1830 a charter for a railroad between Lowell and Boston, the construction of which he directed until its completion in 1835.

Jackson, Samuel Macauley, American church historian: b. New York 19 June 1851. He was graduated from the College of the City of New York in 1870, from the Union Theological Seminary in 1873, and after further study at Leipsic (1873–6), held the pastorate of the Presbyterian Church at Norwood, N. J., in 1876–80. In 1895 he became professor of church history in New York University. He was assistant editor of Schaff's 'Bible Dictionary' in 1878–80, associate and managing editor of the 'Encyclopædia of Religious Knowledge' in 1880–4, and edited 'A Concise Dictionary of Religious Knowledge' (1891). He also prepared the first important bibliography of foreign missions (1891), wrote 'Huldreich Zwingli' (1901), the first original English biography of its subject, and was chosen secretary of the church history section of the American Historical Association.

Jackson, Sheldon, American educator: b. Minaville, N. Y., 18 May 1834. He was graduated at Union College in 1855, at Princeton Theological Seminary in 1858; was ordained to the ministry of the Presbyterian Church in the latter year; and was missionary to Western Wisconsin and Southern Minnesota in 1859–69. In 1869–82 he was superintendent of Presbyterian missions in western Iowa, Nebraska, the Rocky Mountain territories, Wyoming, Colorado, New Mexico, Arizona, Utah, and Montana, and from 1877 in Alaska. In 1885 he became United States general agent of education in Alaska, and in 1887 organized the Alaskan society of natural history and ethnology at Sitka. He aided in founding a Christian college in Utah in 1896, was moderator of the Presbyterian General Assembly in 1897, and wrote: 'Alaska and Missions on the North Pacific Coast' (1880); 'Education in Alaska' (1881); annual reports on 'Education in Alaska' from 1886; and annual reports on the 'Introduction of Domestic Reindeer into Alaska' (1891–1901).

Jackson, Stonewall. See JACKSON, THOMAS JONATHAN.

Jackson, Thomas Graham, English architect: b. Hampstead 21 Dec. 1835. He was educated at Oxford University and became the pupil of Sir George Gilbert Scott (q.v.) (1858–61), making a specialty of the Gothic style. He has designed most of the new buildings in Oxford, Cambridge, Eton, Westminster School, Rugby, Harrow, etc., and has restored Great Malvern Priory and Bath Abbey, besides building many new Gothic churches. He has written: 'Modern Gothic Architecture' (1873); 'Wadham College, Oxford: its History and Buildings' (1893); 'The Church of St. Mary the Virgin, Oxford: its History and Architecture.'

Jackson, Thomas Jonathan, commonly called "STONEWALL JACKSON," American general: b. Clarksburg, Harrison County, W. Va., 21 Jan. 1824; d. near Chancellorsville, Va., 10 May 1863. Lieutenant-General Thomas Jonathan Jackson was one of the most unique, romantic characters of the War between the States, and crowded into the two years in which he served more brilliant achievements which won him wider fame than any other soldier on either side. Descended from Scotch-Irish stock and inheriting many of the qualities of his ancestry, he was left a penniless orphan when three years old, and soon showed "the stuff of which heroes are made," in his manly self-reliant efforts to

THOMAS JONATHAN ("STONEWALL") JACKSON.

support himself. Learning of a vacancy from his Congressional District in the military academy at West Point, he determined to make the journey to Washington and seek the appointment, and set out at once — traveling a part of the way on foot — appearing before the member of Congress from his district in his suit of homespun, and with his leathern saddlebags over his shoulders. The Congressman presented him to the secretary of war, who was so much pleased with the youth's determination that he at once made out his appointment to West Point. He was very badly prepared to enter the academy and barely "squeezed through" on his entrance examination, but by persevering work he gradually rose in his grade until in July 1846 he was graduated No. 17 in a brilliant class containing such men as McClellan, Foster, Reno, Stoneman, Couch, Gibbon, A. P. Hill, Pickett, Maury, D. R. Jones, Wilcox, and others; and one who knew him intimately expressed the confident belief that if the course had been longer "Old Jack" would have graduated at the head of his class. He immediately reported for duty in Mexico, and serving in the artillery won distinction on every field, always seeking the post of danger, being made first lieutenant at the siege of Vera Cruz, brevetted captain at Contreras and Churubusco, and major at Chapultepec, rising to this rank in seven months, and being promoted more rapidly than any other officer of his grade in the Mexican War. He was frequently and honorably mentioned in the official reports, and John B. Magruder, his immediate superior, wrote of him: "If devotion, industry, talent, and gallantry are the highest qualities of a soldier, then he is entitled to the distinction which their possession confers." In the City of Mexico, after its capture and occupation, he had under the influence of that earnest Christian soldier, Colonel Taylor, become deeply concerned on the subject of personal religion and made a profession of faith in the Lord Jesus Christ. At West Point he had adopted as his motto: "You may be whatever you resolve to be," and now he added to this motto the saying of the great Apostle: "I can do all things through Christ which strengtheneth me." These two mottoes were the keynotes of his life and led the penniless orphan boy to become one of the immortals.

On the earnest recommendation of his old comrade, D. H. Hill, whose brother-in-law he afterward became, Jackson was elected, in 1851, professor of natural science and instructor of military tactics in the Virginia Military Institute, Lexington, Va., being elected over McClellan, Reno, Rosecrans, and G. W. Smith, whose names were submitted by the faculty at West Point. He made little reputation as a professor, for while thoroughly acquainted with his subject he lacked that "aptness to teach" so essential to a successful teacher, and the cadets were always playing pranks upon him, and laughing at his eccentricities. But he became one of the most consecrated active members of the Presbyterian Church, and left his impress as a Christian upon the community. From his habit of instructing his own servants in Scripture lessons every Sunday afternoon grew his famous negro Sunday school to which he devoted so much time and thought, to which he contributed so liberally of his moderate means,— sending his pastor checks for it in the midst of his most active campaigns,— and which made such an impress upon the negroes and gave Jackson so warm a place in their affections that the first contribution to his monument was made in 1887 by the negro Baptist Church of Lexington. Jackson was a Union man, opposed to secession as a remedy for Southern wrongs, though thoroughly believing in the abstract right of a State to secede, and greatly deprecated the war which he predicted would follow; but when the news reached the quiet little town of Lexington that Mr. Lincoln had called for 75,000 troops to coerce sovereign States, and that the Union Convention of Virginia had passed an ordinance of secession, Jackson said in a speech before a public meeting: "I have longed to preserve the Union and would have been willing to sacrifice much to that end. But now that the North has chosen to inaugurate war against us, I am in favor of meeting her by drawing the sword and throwing away the scabbard." Governor Letcher, his old neighbor and friend, who had a high estimate of his abilities, commissioned him colonel in the Virginia forces; but his brilliant record in Mexico had been forgotten — he was only thought of as the quiet, eccentric professor, and when his name was presented to the Virginia convention, a prominent member arose and asked: "Who is this Major Jackson, anyway?" and it required all the eloquence of the Rockbridge delegates to secure his confirmation.

Marching the corps of cadets to Richmond where he remained for a brief season assisting in organizing and drilling the raw recruits in the "Camp of Instruction," he was ordered to Harper's Ferry on 3 May, where the skill he showed in reducing the high-spirited rabble who had rushed to the front at the first sound of the bugle to the respectable Army of the Shenandoah, which he turned over to the command of General J. E. Johnston 23 May, showed clearly that he was a soldier. Placed in command of the Virginia brigade which afterward became so famous, he met the advance of General Patterson at Falling Waters on 2 July, gave them a decided check, and captured a number of prisoners. Soon after he received his commission as brigadier-general in the following characteristic letter from General Lee:

RICHMOND, 3rd July, 1861.

MY DEAR GENERAL:— I have the pleasure of sending you a commission of brigadier-general in the Provisional Army; and to feel you merit it. May your advancement increase your usefulness to the State.

Very truly,

R. E. LEE.

But it was in the battle of first Manassas (Bull Run) that Jackson won his new name and fame, and the ringing words of the gallant Bee: "There stands Jackson like a stone wall," changed the name of "Thomas Jonathan" into the immortal "Stonewall" Jackson. He was wounded in the hand but refused to leave the field, and while the surgeons were dressing his wounds President Davis rode on the field, and Jackson, pushing aside the surgeons, tossed his cadet cap in the air and exclaimed: "Hurrah for the President. Give me ten thousand men and I will be in Washington to-night!" In September he was made major-general, and was sent on 4 October to command the "Valley District" and enter in the early part of 1862

on that famous "Valley Campaign," which is now studied in military academies in Europe as illustrative of able strategy, rapid movements, and heroic fighting. In March he fell back before Banks' army of 35,000 men, and Banks reported him "in full retreat from the valley" and started a column to cross the mountains and attack Johnston in flank as he was falling back from Manassas, when Jackson suddenly turned, marched 18 miles in the morning, and with 2,700 men fought at Kernstown, near Winchester, 8,000 of the enemy, and though sustaining the only defeat that ever befell him he accomplished his purpose in recalling the column which was moving on Johnston's flank, quietly moved up the valley and took a strong position in Swift Run Gap from which he could easily defend himself or strike the enemy if he attempted to move on Staunton. Ewell's division coming to take his place, he left this grim soldier to watch Banks, and moved so secretly that neither friend nor foe had divined his plans until he thrilled the Confederacy and sent terror to the North by the following laconic and characteristic despatch:

Valley District, May 9th, 1862.

GEN. S. COOPER:— God blessed our arms with victory at McDowell yesterday.

T. J. JACKSON, Major-General.

He had defeated the advance of Fremont under Milroy and driven it back in great confusion. Then followed in rapid succession the uniting of Ewell's division with his at Luray, the driving in of Banks' flank at Front Royal, the cutting of his retreating column at Middletown, and on 25 May the rout of Banks' army from the heights of Winchester, and driving him pellmell across the Potomac. He was about to cross the Potomac into Maryland in pursuit of Banks when he learned that Fremont from the West, and Shields, the head of McDowell's column, from the East, were marching to form a junction in his rear at Strasburg. He at once put his army in motion and by forced marches (one of his brigades marched 52 miles in one day) he reached the point of danger in time to hold Fremont in check with one hand and Shields with the other until his whole army, prisoners, and immense wagon trains loaded with captured stores passed on in safety. He then moved leisurely up the valley, burning the bridges over the Shenandoah to prevent a juncture between Fremont and Shields — his rear being protected by that chivalrous knight and brave soldier, General Turner Ashby, who filled the valley with the fame of his brilliant achievements, and whose fall in a severe fight near Harrisonburg on 6 June was sadly lamented as a great calamity to the Confederate cause. On 7 June, at Cross Keys, Ewell badly defeated Fremont, and on 8 June, at Port Republic, on the opposite side of the river, Jackson routed Shields, and the armies sent to "crush" him were soon rapidly retreating down the valley, while "Stonewall" — that name will cling to him, but "Thunderbolt," "Tornado," or "Hurricane," would be more expressive of his character,— remained master of the situation. This campaign may be thus summarized: In 32 days Jackson and his "foot cavalry" had marched nearly 400 miles, skirmishing almost daily, fought five battles, defeated three armies, two of which were completely routed, captured 20 pieces of artillery, 4,000 prisoners, and immense quantities of stores of all kinds, and had done all this with a loss of fewer than 1,000 men killed, wounded, and missing, and with a force of only 15,000 men, while there were at least 60,000 men opposed to him. He had spread consternation throughout the North and had neutralized McDowell's 40,000 men at Fredericksburg, who were about to march to the aid of McClellan in investing Richmond. Jackson now rested for a brief season, was reinforced from Lee's army, made the impression on the enemy that he would advance down the valley again, and managed matters so secretly that Banks at Strasburg was busily engaged in fortifying against an expected attack from him at the very time he was thundering on McClellan's flank at Richmond over 200 miles away. The part he bore in the Seven Days around Richmond, the second Manassas campaign, and the Maryland campaign was so conspicuous and so important that it would be, indeed, to write the history of the army to give it in detail. His skill and daring in the Seven Days battles, his defeat of Pope's advance under Banks at Cedar Run, his flank march to Pope's rear, and the pertinacity with which he held him at bay along the Warrenton road until Lee could come up with Longstreet and drive him into the fortifications around Washington, his capture of Harper's Ferry with 11,000 prisoners, 13,000 stand of small arms, 73 pieces of artillery, and large quantities of provisions and stores of every description, and his conduct on the field of Sharpsburg, all added greatly to the fame of Stonewall Jackson and his grand old corps of "Foot Cavalry." It was the privilege of the writer of this sketch to be under Jackson during the whole of his brilliant career, and it may not be amiss to describe him as he appeared at the head of his victorious legions: About 37 years old, six feet high, medium size, gray-blue eyes, light brown hair, a rough mouth, iron jaw, and nostrils as big as a horse's. He wore a plain gray uniform which soon became faded and soiled, cavalry boots, and an old gray cadet cap with its rim tilting on his nose. He rode a raw-boned sorrel horse which the men said "could not run except toward the enemy," but whenever he appeared among the troops they would begin to give the Confederate yell, and he would take off his cap, put spurs to "Little Sorrel" and gallop away from them as rapidly as possible. This was so well understood that, when cheering was heard, some soldier would say: "There comes old Stonewall, or an old hare, one," and it was said that "the appearance of those personages never failed to elicit the genuine old Confederate yell." On 10 Oct. 1862 he was made lieutenant-general, and his corps made to consist of his old division, under W. B. Taliaferro, Early's division, A. P. Hill's division, and D. H. Hill's division, Colonel Brown's regiment of artillery, and numerous light batteries. At Fredericksburg, 13 Dec. 1862, he held the extreme right of Lee's army, and defeated with great slaughter Franklin's attack upon him. The following winter and spring Jackson spent in improving the organization, discipline, and efficiency of his corps, and as, in his judgment, a most important means of accomplishing this, he labored to have chaplains in every regiment and missionaries to visit the army, and did everything in his power to promote the religious welfare of his soldiers. It was largely through

his influence that a chaplains' association was formed, and he had regular prayer-meetings at his headquarters during the weeks and preaching on Sundays. But the end hastened on, Gen. Hooker threw Sedgwick across the river below Fredericksburg the latter days of April 1863, crossed the bulk of his army above and strongly fortified his lines at Chancellorsville in the confident hope that Lee would either retreat on Richmond, or attack him in his strong position, where a crushing defeat would await him. But instead of doing either of these things Lee left Early to watch Sedgwick, moved up to Hooker's front, and sent Jackson with 22,000 men to make a march to Hooker's flank and rear. This was brilliantly executed and Jackson routed that flank of Hooker's army, and was proceeding to cut him off from his line of retreat and take a position where Hooker would have been compelled to attack him, when in returning from one of those bold reconnoissances which he so frequently made, his party was mistaken for the enemy and fired on by his own men and he was very severely wounded. His left arm was amputated, his other wounds dressed, and he was doing well and gave every promise of recovery, when pneumonia, brought on by exposure before the battle, set in and he died at a quarter past three P.M., Sunday, 10 May 1863.

The great soldier had fought his last battle, won his last victory, and gone to wear his glittering "crown of rejoicing." He was buried as he had requested, in "Lexington in the valley of Virginia"; a beautiful bronze statue marks his grave; on the hill at the Virginia Military Institute has been reared the stately "Jackson Memorial Hall," and in the capitol square of his native State stands the noble bronze statue, the gift of English admirers. Lee spoke his fittest eulogy when he wrote him after hearing that he was wounded: "Could I have dictated events I should have chosen for the good of the country to have been disabled in your stead."

J. Wm. Jones, *Author and Lecturer.*

Jackson, William Hicks, American soldier and stockman: b. Paris, Tenn., 7 Oct. 1836; d. Nashville, Tenn., 30 March 1903. He was graduated from West Point in 1856, entered the Confederate army in 1861 as captain of artillery, and rose to be brigadier-general. Subsequent to the war he was proprietor of the Belle Meade stock-farm, near Nashville, Tenn., which sent to the races some of the greatest running horses of the American turf. He was president of the National Agricultural Congress, and high in the councils of the southern Democracy.

Jackson, Mich., city and county-seat of Jackson County; situated on the Grand River, about 37 miles south of Lansing and 76 miles west of Detroit, and on the main line of the Michigan Central Railroad. It is the termini of the Air Line, the Grand River Valley, and Jackson, Lansing & Saginaw railroads, branches of the Michigan Central; of the Toledo and Fort Wayne branches of the Lake Shore & Michigan Southern; the Cincinnati Northern, a branch of the Big Four, and the Michigan Air Line, a branch of the Grand Trunk railroads; and is connected with Detroit, Battle Creek, and Kalamazoo by traction lines.

Manufactures, Industries, etc.—Jackson is situated in a rich agricultural region and carries on an extensive trade in fruits, grains, and vegetables. Its chief manufactures are sewer pipe, flour, soap and starch, automobiles, pianos, oil stoves, corsets and underwear, wheels, engines and motors, locomotives, foundry products and agricultural implements. The car shops of the Michigan Central railroad, employing 1,200 men, are located here. Among the important industries are carriage- and wagon-making, manufacture of textiles, iron and steel, cigar-making, Portland cement, and mining, together employing about 6,000 hands, and with a yearly output of over $10,000,000. Coal and clay, the latter useful for pottery, are found near by.

Banks.—There are four banks, with a combined capital of $450,000, surplus and undivided profits of $275,000, and deposits of over $4,000,000.

Churches and Educational Institutions.—Nearly all denominations are represented and worship in 28 church edifices. The school system is exceptionally fine, there being two high schools and 17 graded public schools. There are also three Catholic schools.

Public Buildings, etc.—Among the prominent buildings are the Michigan State prison, Carnegie Library, the United States government building, Elks Temple, Masonic Temple, courthouse, and City Club. The city also has a hospital and two sanitariums, and Young Men's and Young Women's Associations.

Newspapers.—There are two morning and two evening dailies, with an aggregate circulation of 12,000, two semi-weeklies and three weeklies, one of which is German.

Government, Public Works, etc.—The executive authority is vested in a mayor and a council of 16 members, elected for a term of two years. The city is lighted by gas and electric light, and owns and operates its waterworks. It has a fire department with four well-equipped engine-houses, and an excellent police department. There is also an electric trolley system operating about 10 miles of track.

History.—The first permanent settlement was made by Horace Blackman in 1829, and was first called Jacksonburgh in 1830. In the same year a post-office was established and named Jacksonapolis. In 1831 the township of Jacksonburgh was formed, and remained such until 1838, when the name was changed to Jackson. When the Michigan Central Railroad was constructed through the southern part of the State, in 1841, Jackson grew rapidly, became a village in 1843, and an incorporated city in 1857.

Population.—The inhabitants are mainly native born, though about one third are of foreign descent, Irish, German, Polish, and Italian predominating. Pop. (1890) 20,798; (1900) 25,180; (1905) 28,000.

Thomas A. Wilson.

Jackson, Miss., capital of the State, county-seat of Hinds County; on the Pearl River and on the Yazoo & M. V., the Illinois C., and the Alabama & V. R. R.'s; about 40 miles east of Vicksburg, on the Mississippi. The first permanent settlement was made in 1828 or 1829, and it was incorporated in 1840. In 1863 it was occupied for some time by Union forces under Gen. Grant, and the ruins of the fortifications erected at the siege are still in existence.

The city was nearly destroyed in 1864, by Gen. Sherman.

Jackson is situated in an agricultural region in which a large amount of cotton is raised. It is the commercial centre for a large section. The good railroad facilities and the advantage of traffic on the Pearl River are stimulating the increase of marketable agricultural and manufactured products. The chief industrial establishments are cottonseed-oil mills, fertilizer factories, sash, door, and blind factories, foundries, brick-yards, a cotton-compress, a plow and harrow factory, a broom factory and cooper shops. Some of the principal public buildings are the State capitol, State charitable institutions for the blind, insane, deaf and dumb, the State library, and the James Observatory. Among the private educational institutions of learning are the Millsaps College, founded in 1892 under the auspices of the Methodist Episcopal Church; and the Bellhaven College for young ladies. Pop. (1890) 5,920; (1900) 7,816; (1903) 12,000.

Jackson, Ohio, city, county-seat of Jackson County; on Salt Creek, and on branches of the Baltimore & O. S. W., the Hocking V., and the Ohio S. W. R.R.'s; about 100 miles east of Cincinnati and 70 miles southeast of Columbus. Jackson is located in the vicinity of the early routes of travel from the Ohio River to the interior of what is now the State of Ohio, and on to the Great Lakes. The first permanent settlement was made in 1795, but it was not incorporated until 1847, several years after the limits of Ohio were decided. It is situated in a coal and iron mining section, but there is a large amount of good farming land in the vicinity. The chief industrial establishments of the city are foundries, machine-shops, furnaces, woolen-mills, a tannery, and lumber-yards. The coal and iron ore-mining of the vicinity contributes largely to the industrial wealth of the city. Pop. (1900) 4,672.

Jackson, Tenn., city and county-seat of Madison County, situated about 80 miles northeast of Memphis, on the South Fork of the Forked Deer River, and on the Illinois C., Mobile & O., and Nashville, C. & St. L. R.R.'s. It is the trade centre of a large and fruitful agricultural region, is an important cotton market, and has manufactures of engines and boilers, cotton goods, lumber, machinery, flour, cottonseed-oil, furniture, trunks, spokes and skewers, plows, carriages, bricks, and other products. Here are located the Southwestern Baptist University, the Memphis Conference Female Institute, and Lane University. Jackson has a fine park, Carnegie Library, and modern municipal improvements, the waterworks and electric-light system being owned by the city. It has five banks with a combined capital of $400,000. The government is by mayor and a council of eight aldermen. Jackson was first settled in 1818. Pop. (1900) 14,511.

During the Civil War Jackson was at times the headquarters of Gen. Grant. It was captured by Union troops 7 June 1862. On 19 Dec. 1862, Gen. Forrest sent detachments of cavalry to destroy the railroad to the north and south, and with 400 men advanced on Jackson and had a running fight with two regiments of Union infantry and detachments of cavalry under Col. Engelmann of the 43d Illinois, who disputed Forrest's advance until the fortifications of the town were reached, when Forrest withdrew and moved on Humboldt and Trenton. On 13 July 1863, a Confederate cavalry force held the town and guarded a large number of conscripts. Col. Edward Hatch with 1,160 men of the 3d Michigan, 2d Iowa, 1st West Tennessee, and 9th Illinois cavalry regiments attacked the Confederates and drove them from the town, releasing about 450 conscripts, and capturing 250 horses and nearly 400 stand of small arms. Hatch's loss was very slight. The Confederates had 38 killed and about 150 wounded. Consult: 'Official Records,' Vol. XXIII.

Jackson (Miss.), Battle of. After the battle of Raymond (q.v.), 12 May 1863, Gen. Grant, having provided for the safety of his rear and left from the direction of Vicksburg, turned McPherson's and Sherman's corps and part of McClernand's on Jackson, 12 miles northeast of Raymond, to capture the place without delay. On the 13th McPherson moved from Raymond to Clinton, and then turned east on Jackson. Sherman moved through Raymond to Mississippi Springs on the 13th, and that night arranged with McPherson that both columns should arrive at Jackson about the same hour next day. McClernand closed up to Raymond and sent one division to Clinton to support McPherson. Gen. J. E. Johnston had arrived at Jackson on the evening of the 13th and, hearing next morning of the Union approach on the Raymond and Clinton roads, ordered Gregg's brigade to take position on the first-named road, and Walker's brigade on the latter, with instructions to each to delay the Union advance as long as possible, to give time for the removal of public property from the city. The combined strength of Gregg and Walker was about 6,000 men. About 9 A.M. of the 14th McPherson's advance on the Clinton road came upon Walker's pickets and drove them back upon the main body, posted in works on the crest of a semicircular ridge 2½ miles west of Jackson, the front covered by a marshy creek lined with dense willows, and artillery commanding the bridge over the creek. At the end of nearly two hours Crocker's division of three brigades was deployed in line, with one brigade of Logan's in reserve. At 11 A.M. the skirmishers advanced to the creek and were checked, upon which the entire division went forward, drove in Walker's skirmishers, and advanced over the open ground beyond the creek, meeting a stout resistance; but Walker's men soon retreated, abandoning seven guns. They were pushed more than a mile by Crocker; but his men fell into some disorder, and were finally brought to a stand by artillery posted in an inner line of works close to the town. While Crocker was reforming, Walker made his escape to the Canton road. Crocker's loss was 265 killed and wounded. On the Raymond road Sherman encountered Gregg and, by a flank movement, compelled him to abandon his entire line and ten guns, with the loss of nearly 200 prisoners and 81 in killed and wounded. Sherman's loss was 32. Johnston retreated northward on the Canton road. McPherson and Sherman entered Jackson between 3 and 4 P.M.; Sherman was left in the city to destroy the railroads, bridges, factories, arsenals, and everything valuable. On the morn-

ing of 15th Grant turned the rest of his army west, defeated Pemberton at the battle of Champion's Hill (q.v.) on the 16th, drove him across the Big Black on the 17th, and began the siege of Vicksburg. The Union loss at Jackson was 42 killed, and 251 wounded. The Confederates make their loss less than 400, but Sherman estimated it at 845 killed, wounded and missing. Consult: 'Official Records,' Vol. XXIV.; Johnston, 'Narrative'; Sherman, 'Memoirs, Vol. I.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. Carman.

Jackson, Siege of. The battle of Jackson (q.v.), 14 May, 1863, was followed by the movement of Gen. Johnston northwest, with Gregg's and Walker's brigades, to form a junction with Pemberton, who had been directed to join him; but early on the 19th he received word from Pemberton that he had decided to hold Vicksburg instead, upon which Johnston marched his troops to Canton. He was reinforced, and 29 June he marched west to operate in the rear of Grant, who was besieging Vicksburg. He was about to move on the morning of 5 July to the south of the Vicksburg and Jackson Railroad, when he heard that Vicksburg had fallen, whereupon he fell back to Jackson and occupied a line of works covering the town, with both flanks on Pearl River. Gen. Sherman had been held in readiness to move back and drive the Confederates from the State, and when Vicksburg fell he moved promptly with his own corps and those of Gen. Ord and Parke, crossed the Big Black at three different points, and by 11 July was close up to Johnston's works and shelling the city with nearly 100 guns. Ord's Thirteenth corps was on the right, the Fifteenth corps in the centre, and Parke's Ninth corps on the left. On the 12th the fire of the artillery was increased, reaching every part of the town, and Lauman's division of Ords' corps, moving in dense woods, came too close to the Confederate works, was struck in flank and driven back in disorder, losing over 500 men killed, wounded, and captured, together with the colors of three regiments. The siege was prosecuted night and day, and on the morning of the 17th Jackson was found evacuated, Johnston having retreated on the road to Brandon, and thence to Morton, where he arrived on the 20th. Steele's division pursued Johnston as far as Brandon, 14 miles from Jackson; Sherman remained five days at Jackson, destroying much property of every description, and then returned to Vicksburg. The Union loss at Jackson, 11–16 July, was 129 killed, 762 wounded, and 231 missing or captured. The Confederate loss, 5–25 July, was 71 killed, 504 wounded, and 764 captured or missing. Consult: 'Official Records,' Vol. XXIV.; Johnston, 'Narrative'; Grant, 'Memoirs,' Vol. I.; Sherman, 'Memoirs,' Vol. I.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. Carman.

Jacksonville, Fla., one of the most important and rapidly growing ports of the southeastern United States; chief city of the State, and seat of Duval County in the northeastern corner; on the west bank of the St. John's, 24 miles from the ocean by water, 14 direct. It is one of the chief southern railroad centres, six important lines converging there, three of them great trunk lines: the Southern, Seaboard Air Line, Atlantic Coast Line, Georgia Southern & Florida, Florida East Coast, and Jacksonville & Southwestern. It is 138 miles south of Savannah, 212 north of Tampa, and 165 east of Tallahassee; and about 1,000 from New York, with train service of 25 to 28 hours. It is also connected with all the Atlantic coast cities by the Clyde, Mallory, and Ocean Steamship lines; and with the picturesque St. John's and its tributaries by six daily and tri-weekly lines of steamers. The fascinating rivers, lakes, Everglades, etc., of Florida, the best hunting and fishing grounds east of the Mississippi, with Jacksonville's mild and healing winter and even summer climate, make it one of the leading tourist resorts in the country, some 50,000 to 60,000 stopping annually at its numerous large and well-equipped hotels.

Jacksonville's position makes it the business key and metropolis of the peninsula, the great shipping point for Florida's exports, and the distributing point for its purchases. Of the former, the chief are lumber, shingles, and ties, mainly yellow pine from the great Florida forests, to nearly $2,000,000 a year; next come naval stores — turpentine, rosin, and rosin oil — of over $1,000,000, and rapidly increasing, a company with $3,000,000 capital having been recently organized for it; cotton has also risen to over $600,000 a year; and an extremely heavy element is the shipping of fruit — oranges, pineapples, and a great diversity of tropic fruits, for which see Florida — and garden vegetables to the North. In a suburb of the city is the largest ostrich farm in the United States, and the only one east of California, whose products form part of the shipments; these also include great quantities of phosphates and fertilizers, and kaolin. As a jobbing centre for interior trade, it has the immense advantage of having practically no competitor in the State, and is rapidly becoming one of the foremost in the South; there are 19 large wholesale grocery houses alone, and the freight entries of grain, hay, and milled products amounted in 1900 to over $12,000,000. Its gross annual trade exceeds $75,000,000. This business implies large banking facilities; and there are now two national and three State banks in the city, besides a savings bank, with over $1,100,000 of capital and undivided profits.

In manufacturing, Jacksonville's chief specialty is lumber and timber products, which in 1900 amounted to nearly a third of the entire output of $2,312,309; there are ten large saw and planing mills. Of the other industries, the most considerable was the manufacture of ice, five establishments producing $87,647 worth; a witness to the needs of thronging tourists in a warm climate. But there were also foundry and other iron products, steam engineering works, brick and tile, paving and roofing materials, wooden ship and boat building, carriages, saddlery, mattresses and palmetto fibre products, pulp, patent medicines, confectionery, cigars, and other articles. There are about 200 different establishments in all.

As a port, it has long been hampered by shoals in the river, and the bar outside the St. Johns. The river is a magnificent estuary, a mile wide for many miles up, and with a channel deep enough for the largest ocean vessels; but it

was not until 1896, by combined government and local efforts, that a channel 19 feet deep was obtained from Jacksonville to the ocean, admitting vessels of 3,800 tons. The National government, at last, in 1901, appropriated $1,300,000 to deepen it to 24 feet all the way, by a permanent system of jetties and dredging. It has over seven miles of water front. The city, 7.6 square miles in area, is handsomely laid out, and its business section is almost entirely new, having been practically obliterated by a fire on 3 May 1901, which destroyed 148 blocks, covering 455 acres and including 2,361 buildings, a property loss of over $15,000,000. With astonishing energy up to 25 Oct. 1903, 3,361 new buildings had been erected, 1,000 more than were destroyed, and greatly improved ones. Among the finest buildings are the Union station, United States post-office and custom-house, Masonic Temple, St. Luke's hospital, National Bank of Jacksonville (which were spared by the fire). Among the public buildings since erected are the Windsor hotel, Seminole, Elks, Woman's and Wheelmen's club-houses, Mercantile Exchange Bank, Board of Trade, and Duval High School. A $50,000 Carnegie free library is being erected. The religious denominations have built a number of fine churches, costing from $25,000 to $100,000 each. Notable among them are the Congregational, Baptist, Christian, McTieire Memorial (M. E. South), Snyder Memorial (M. E.), Presbyterian, St. John's Episcopal, Church of Good Shepherd, Episcopal, and three fine colored churches. There are five parks of 57 acres in all, "Hemming" having a Confederate monument; and 14 miles of shell streets and drives, besides a general macadamizing of paving with vitrified brick. The ocean beaches, 18 to 20 miles off, are among the finest on the Atlantic coast. The sanitation of the city is perfect. After the yellow fever epidemic of 1888 it installed a fine thorough system of sewerage, drained and filled in the swampy tracts around, and replaced the water supply with one almost chemically pure, drawn from artesian wells 500 to 1,000 feet deep. Its death rate has sunk to 10 in 1,000, one of the lowest in the country. There are 20 miles of trolley tracks, and the city owns electric-light works and waterworks; both light and water are extremely cheap. The finances of the city are in the best condition. It has never defaulted its bonds, which are for the waterworks and electric plant, and amount to $1,368,000, payable 15 May 1904 at 5 per cent. There is no floating debt. The assessed valuation is $15,000,000; tax 16.02 mills on the dollar, or 11 mills if beyond the hydrants. Jacksonville was settled in 1816 by Lewis Z. Hogans, whence Hogans' Creek, dividing the city, is named. In 1822 it was laid out and named after Andrew Jackson, the first territorial governor of Florida. It was incorporated in 1833. The Seminole War prevented its development, but it revived in 1842 and has grown steadily since. Its population in 1850 was 1,045, in 1860 2,118, in 1870 6,912, the war having been an immense gain instead of loss; 1880 7,650, 1890 17,201, 1900 28,429, of whom 16,271 or 57 per cent were colored. At present (1903) is over 35,000.

CHAS. H. SMITH.
Secretary Jacksonville Board of Trade.

Jacksonville, Ill., city, county-seat of Morgan County; situated on the Mauvaisterre Creek, a branch of the Illinois River, about 34 miles southwest of Springfield and 88 miles north of St. Louis, Mo.; on branches of the Wabash, the Chicago & A., the Burlington, the Chicago, P. & St. L., and the J. & St. L., the last of which is also a part of the Burlington system. Jacksonville was laid out as early as 1825, about seven years after the admission of the State of Illinois into the Union, established as a town in 1840, and incorporated as a city in 1867. It was made the county-seat of Morgan County in 1825. The origin of the name of the city is somewhat uncertain, but the most probable tradition seems to indicate that it was named in honor of Andrew Jackson, who was a prominent Presidential candidate at the time when the town was founded. Jacksonville is noted for its institutions of learning, its wide, prettily shaded streets, and its handsome residences. It is the seat of Illinois College, the oldest college in the State, founded through the efforts of local residents and a band of students from Yale College. Originally non-sectarian, the college has recently become Presbyterian, has absorbed the Jacksonville Female Academy, and become affiliated with the University of Chicago. Among the other institutions are: the Illinois Woman's College, established in 1847 under the auspices of the Methodist Episcopal Church; the State Central Hospital for the Insane; the State School for the Blind; the State School for the Deaf and Dumb; Our Saviour's Hospital, in charge of the Sisters of the Holy Cross; the Passavant Memorial Hospital; a Carnegie Free Public Library; the Conservatory of Music; and Whipple Academy, a preparatory school. The last two are connected with Illinois College. The city-hall, the court-house, and the high school are the most prominent public buildings. Besides these, there are numerous church edifices, the most attractive of which is the Westminster Presbyterian. The most important industrial establishments of the city are the woolen mills, and the car-shops of the Chicago, Peoria & St. Louis Railroad. Other manufactures include machine-shop products, bricks, candy, paper, and flour. The executive head of the city government is a mayor, who holds office for two years, and a city council composed of 12 members elected for two years by the four wards. The mayor appoints the administrative officials, subject to confirmation by the council. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 12,935; (1900) 15,078.

C. H. RAMMELKAMP,
Head of Department of History and Political Science, Illinois University.

Jacob (Heb. *Yaqōbh,* the supplanter), the son of Isaac, and the grandson of Abraham, the last of the Jewish patriarchs, and the real ancestor of the Jews. He died at the age of 147 years, about 1860 B.C., and was buried in the tomb of Abraham, before Mamre in Canaan.

Jacob Tome Institute, an institution of secondary education located at Port Deposit, Md. It was founded 1894 by Jacob Tome. When Mr. Tome's gift was made, only five other citizens of the United States — Stephen Girard, Anthony J. Drexel, Johns Hopkins,

Charles Pratt, and John D. Rockefeller — had made greater gifts to educational institutions. The endowment and other property of the school are estimated at more than $3,000,000. The Jacob Tome Institute was incorporated in 1889. The boarding school for boys, founded in 1900, is located on the hills overlooking the historic Susquehanna River. The grounds of the institute include about 160 acres. The principal buildings are Memorial Hall, erected in memory of the founder, two dormitories, gymnasium, the Inn, power plant, and infirmary. The school consists of six classes, each requiring one year. The studies of the last three years are arranged in five groups which prepare students for college, technical schools, or for active business life. The institute confers no degrees, although a certain amount of collegiate work can be and is done in the regular courses: Students must be not less than 10 years of age in order to gain admission. Special scholarships are offered to boys from Maryland. There is also a kindergarten, Junior School, and Senior School for girls.

Jacobi, ja-kō'bī, Abraham, American physician: b. Hartum, Westphalia, 6 May 1830. He was educated at the universities of Greifswald, Göttingen, and Bonn, and was graduated as M.D. from the latter in 1851. Those were years of revolutionary ferment in Germany and Jacobi, becoming identified with the movement, was held in detention for "high treason" at Berlin and Cologne (1851–3). In 1853 he settled in practice in New York, where his abilities soon brought him into notice. He was appointed professor of diseases of children at the New York Medical College (1860–5) and held a similar chair in the medical department of the University of the City of New York (1865–70). Some years later he became professor of the diseases of children at the College of Physicians and Surgeons. He has held many important appointments, and was president of the New York State Medical Society (1882) and of the New York Academy of Medicine (1885–9). In 1900 his 70th birthday was made the occasion of a public demonstration in his honor. Author: 'Dentition and its Derangements'; 'Infant Hygiene'; 'Diphtheria'; 'Therapeutics of Infancy and Childhood'; 'Infant Diet.'

Jacobi, Friedrich Heinrich, German philosopher: b. Düsseldorf 25 Jan. 1743; d. Munich 10 March 1819. He was educated at the University of Geneva, and in 1764 entered upon a commercial career in his native town; after a few years, he retired from business, and in 1770 became a member of the councils for the duchies of Juliers and Berg. From his university days he was actively interested in literature and philosophy, and with Wieland started a journal in which some of his own writings were first published. In 1779 he went to Munich for a short time; and in 1793 left Düsseldorf and settled in Holstein. In 1804 he was called to Munich as a member of the Academy of Sciences then newly established; from 1807 to 1812, he was president of the academy; and in 1812 retired to prepare a collected edition of his works, which, however, was not finished before his death. His writings include two philosophical romances, 'Allwills Brief-Sammlung' (1774), and 'Woldemar' (1779); and the more important philosophical treatises 'Briefe über die Lehre Spinoza's' (1785); 'David Hume über den Glauben oder Idealismus and Realismus' (1785); 'Von den Göttlichen Dingen' (1811). In these treatises he defines his theory that man's thought — or reason — is by its nature partial and limited, and can only connect facts, not explain their existence; and that the higher truths must be understood through another different faculty which he calls "faith" or "belief" ("Glaube"); he does not, therefore, seek to establish a systematic philosophy. His theories involved him in considerable controversy, especially with the adherents of the critical philosophy.

Jacobi, Herman Georg Jakob, German Sanskrit scholar: b. Cologne 11 Feb. 1850. He was educated at Cologne Gymnasium, and later took up a course of studies in Sanskrit and allied languages at the universities of Bonn and Berlin. After spending a year (1872–3) in the Indian office in London on the old Sanskrit manuscripts, he went to India, making a tour of Rajputana. In 1875 he became a docent in Sanskrit at Bonn; from 1876–85 was professor extraordinarius of Sanskrit and Comparative Philology at Münster, Westphalia; in 1885 was made professor ordinarius of Sanskrit at Kiel, Holsatia; and in 1889 was appointed professor of Sanskrit at Bonn. He made a particular study of Jainism and Prâkrit grammar, writing exhaustively on those subjects as well as on the Sanskrit poetical languages. Among the most important of his works are 'The Indian Antiquary' and the 'Epigraphia Indica', published in 1892, in which he gives two sets of tables showing the Hindu dates in inscriptions, a work of much value. His other works include: 'De Astrologiæ Indicæ, Horâ appellatæ originibus' (1872); 'The Kalpasûtra of Bhadrabâhu' (1879); 'The Âyaramgo Sutta of the Çvetâmbra Jains' (1882); 'Gaina Sûtras' (1884); 'Ausgewählte Erzählungen in Mâhârâshtri. Zur Einführung in das Studium des Prâhrit' (1886); 'The Porisishtaparvan by Hemachandra' (1891); 'Sthavirâvali Charita' (1891); 'Das Râmâyana Geschichte und Inhalt, nebst Concordanz der gedruckten Recensionen' (1893); 'Kompositum und Nebensatz, Studien über die indogermanische Sprachentwicklung' (1897); etc.

Jacobi, Johann Georg, German poet: b. Düsseldorf 1740; d. 1814. He was a brother of the philosopher, Friedrich Heinrich Jacobi (q.v.) He was educated at Göttingen and in 1766 was appointed to the chair of philosophy and oratory at the University at Halle. In 1784 he became professor at Freiburg. He edited 'Iris' with Gleim (1774–6); and published in 1786 his correspondence with Gleim. An edition of his collected works was published at Zürich in 1882 and his 'Ungedruckte Briefe von und an Johann Georg Jacobi' appeared in 1874 edited by Martin.

Jacobi, Karl Gustav Jakob, German mathematician: b Potsdam 10 Dec. 1804; d. Berlin 18 Feb. 1851. He obtained his education at the University of Berlin, where he studied especially mathematics and philosophy, later in 1824 becoming a privat-docent there. In 1825 he became assistant professor of mathematics at Königsberg and in 1827 was appointed professor. He was appointed a member of the Prussian Academy of Sciences in 1836 and from

1842 till his death in 1851 lectured at the University of Berlin. His most important work was on the theory of elliptic functions but he also made some valuable contributions to the theory of numbers and determinants. Only a small portion of his writings and lectures were published during his lifetime and the greater part of these were published in the *Crelles Journal.* Among these are: 'Fundamenta Nova Theoriæ Functionum Ellipticarum' (1829); 'Canon Arithmeticus' (1839); 'De Formatione et Proprietatibus Determinantium' (1841); 'Mathematische Werke' (1846–71). A complete edition of his works 'Gesammette Werke' was published in seven volumes by the Berlin Academy of Sciences (1881–91). His 'Vorlesungen über Dynamik' did not appear till 1866, long after his death, and later in 1895, his essay 'Uber die vierfach periodischen Functionen Zweier Variabeln' was published in Latin.

Jacobi, Mary Putnam, American physician: b. London, England, 31 Aug. 1842; d. New York City, 10 June 1906. She was graduated from the New York College of Pharmacy in 1862, from the Woman's Medical College of Philadelphia in 1864, and from the Ecole de Médecine of Paris in 1871. She then entered practice in New York, in 1881 was appointed clinical professor of the diseases of children in the New York Post-Graduate Medical School, where she lectured for three years. In 1874 she established an association for the promotion of the medical education of women, and became its president. In 1873 she was married to Abraham Jacobi (q.v.) She became a member of the American Medical Association, and published several works, including: 'The Question of Rest for Women during Menstruation' (1877); 'Acute Fatty Degeneration of New Born' (1878); 'The Value of Life' (1879); 'Cold Pack and Anæmia' (1880); 'The Prophylaxis of Insanity' (1881); 'Common Sense Applied to Woman's Suffrage' (1894).

Jacobi, Moritz Hermann, German physicist: b. Potsdam 1801; d. 1874. He was appointed professor of physics at the University of Dorpat in 1835 and while there did important work in scientific research, especially along the line of physics. He was the inventor of new processes in galvano-plastics and electrotyping, and in 1842 was made a member of the Academy of Sciences at Saint Petersburg. The most remarkable and important of his works was an essay published in 1835, 'Memoire sur l'application de l'électro-magnetisme au mouvement des machines,' which was shortly afterward in 1840 followed by 'Die Galvanoplastik.'

Jacobi, Otto R., Canadian landscape painter: b Königsberg, Prussia, 27 Feb. 1812. After executing several important water-colors for the crowned heads of Europe, he was appointed court painter at Wiesbaden. In 1860 he came to Canada, where his ability won him membership in 1880 to the Royal Canadian Academy of Art, and in 1890 he was elected president.

Jacobins, jăk'ō-bĭnz, the most famous of the clubs of the first French Revolution. When the States-General assembled at Versailles in 1789, it was formed and called the Club Bréton. On the removal of the court and national assembly to Paris it acquired importance and rapidly increased. It adopted the name of Société des Amis de la Constitution, but as it met in a hall of the former Jacobin convent in Paris, it was called the Jacobin Club. It gradually became the controlling power of the Revolution, and spread its influence over France, 1,200 branch societies being established before 1791, and obeying orders from the headquarters in Paris. The Jacobins were foremost in the insurrectionary movements of 20 June and 10 Aug. 1792; they originated the *commune de Paris,* and changed their former name to Les Amis de la Liberté et de l'Egalité. For a while they ruled supreme, and the Convention itself was but their tool. Robespierre was their most influential member; they ruled through him during the Reign of Terror, and were overthrown after his downfall in 1794. In that year the Convention forbade the affiliation of societies; the Jacobin Club was suspended and its hall was closed. The term Jacobin is now often used to designate anyone holding extreme views in politics. Numberless pamphlets were then published in regard to the Jacobins, the most noted being 'La Jacobinade,' 'Le secret des Jacobins,' and 'Les crimes des Jacobins.'

Jac'obite Christians, a subdivision of the sect of the Monophysites (q.v.) comprising those who dwelt in Syria, Mesopotamia, and Babylonia, organized by a certain Jacobus Baradæus, in the reign of Justinian, somewhat later than the middle of the 6th century. Jacobus had been a monk whose poverty-stricken asceticism gained for him the title of Jacobus Baradai (Ragged James). He had been appointed bishop of Edessa in 541, and from that year to 578 he traveled round gathering the members of his heretical sect, until they formed a compactly ordered body which has survived to the present time. They now number about 80,000, and are governed by two so-called Patriarchs, one of Antioch, the other of Jerusalem.

Jac'obites, a party in Great Britain (so styled from Lat. *Jacobus,* James), who after the revolution in 1688 continued to be the adherents of the dethroned King James II. and his posterity. In Ireland they were soon put down by conquest. In England the revolution was accomplished with the apparent consent of all parties; but in a year or two the Jacobite party gained considerable influence, and continued to disturb the government of William throughout his reign. After the accession of Anne and the death of James their efforts slackened for a time; but toward the close of her reign they revived. Bolingbroke and Oxford, with others of the Tory ministers of Anne, were in treaty with the son of James II., and either really or pretendedly negotiated for a restoration. On the arrival of George I. in 1715 a rebellion broke out in Scotland, supported by a more insignificant rising in the north of England. The failure of both these movements damped the enthusiasm of the English Jacobites, but in Scotland the party maintained its influence until the unsuccessful rebellion of 1745 put an end to its political importance, though some ultra-Jacobites did not think themselves justified in transferring their allegiance to the house of Brunswick till the death of Cardinal York in 1807. The hopes and wishes of the

Scottish Jacobites found expression in many beautiful songs, which form an interesting feature of the national literature.

Jacobs, Henry Eyster, American Lutheran clergyman and theologian: b. Gettysburg, Pa., 10 Nov. 1844. He was graduated from Pennsylvania College (Gettysburg) in 1862, from the Lutheran Theological Seminary at Gettysburg in 1865, was professor of Latin and history in Pennsylvania College in 1870–80, of ancient languages in 1880–1, and of Greek in 1881–3. In 1883 he became professor of systematic theology in the Lutheran Theological Seminary, and in 1894 dean of the faculty of that institution. His publications include: 'The Lutheran Movement in England' (1891); a 'History of the Lutheran Church in America' (1893); 'Elements of Religion' (1894); a 'Life of Martin Luther' (1898); and 'The German Emigration to America 1709–40' (1899).

Jacobs, Joseph, Anglo-American author and journalist: b. Sydney, New South Wales, 29 Aug. 1854. He was graduated from St. John's College, Cambridge, was at various times editor of 'Folk Lore,' the 'Literary Year-Book,' and the 'Jewish Year-Book,' was elected president of the Jewish Historical Society, and became literary editor of the 'Jewish Encyclopædia.' In 1896 he lectured in the United States. His publications include, beside translations and editions of English classics: 'Celtic Fairy Tales' (1891); 'Indian Fairy Tales' (1892); 'The Jews of Angevin England' (1893); 'Studies in Biblical Archæology' (1894); 'Literary Studies' (1895); and 'Jewish Ideals' (1896).

Jacobus, Melancthon Williams, American Presbyterian clergyman and educator: b. Allegheny, Pa., 15 Dec. 1855. He was graduated from Princeton in 1877, from the Princeton Theological Seminary in 1881, and after study at Göttingen and Berlin (1881–4), was pastor of the Presbyterian Church at Oxford, Pa., in 1884–91. In 1891 became professor of New Testament exegesis and criticism in the Hartford (Conn.) Theological Seminary. His Stone lectures at the Princeton Theological Seminary (1897–8) appeared as 'A Problem in New Testament Criticism' (1900).

Jaco'by, Harold, American astronomer: b. New York 4 March 1865. On his graduation from Columbia University in 1885, he determined to apply himself to astronomical research, a subject in which he had always evinced interest, and he was appointed assistant astronomer United States eclipse expedition to West Africa (1889–90). He has been professor of astronomy at Columbia since 1894 and is an active member of the leading astronomical and scientific societies at home and abroad. He has written numerous technical monographs in astronomical photography, stellar parallax and star clusters which have been published by French, English and Russian societies. He has also been a frequent contributor to the periodical press on popular astronomy.

Jacotot, Jean Joseph, zhŏn zhō-zĕf zhä-kō-tō, French educator: b. Dijon 4 March 1770; d. Paris 30 July 1840. He was successively soldier, secretary to the minister of war, and deputy-director of the Polytechnic School, where he was also professor of mathematics. He went to Brussels in 1815, in 1818 was appointed lecturer on the French language in the University of Louvain, and in 1827 director of the Military Normal School. The fundamental principle upon which his system of education rests is that every person is able to educate himself, provided he is once started in the right way. Knowledge should first be acquired through instinctive experience, or by the memory. For example, in imparting a knowledge of a language, Jacotot began by making the pupil commit to memory a single passage; he then encouraged him to study for himself, first the separate words, then the letters, then the grammar, and lastly the full meaning and import. His steps were learn, repeat, reflect, and verify. He expounded his views in 'Enseignement Universel' (1822). Consult: 'Life,' by A. Guillard (1860); Quick, 'Educational Reformers' (1868); Payne, 'Lectures on Education' (1892).

Jacquard, Joseph Marie, zhō-zĕf mä-rē zhä-kär, French inventor: b. Lyons 7 July 1752: d. Oullins, near Lyons, 7 Aug. 1834. His parents were silk weavers, and he learned the same trade. After a long period of hardship, during which he shared in some of the campaigns of the Revolution, he made his name famous by the invention of his new loom, which was publicly exhibited in 1801. He endeavored to introduce it into general use in Lyons, but was mobbed, and all but lost his life. Ultimately, however, his invention was bought by the French government, and he was able to spend the latter part of his life in comfortable independence. The subsequent prosperity of Lyons is largely attributable to his invention, and a more enlightened generation erected a statue to him in 1840 on the very spot where his loom was publicly destroyed. See Loom.

Jacquard Machine. See Damask Manufacture.

Jacquerie, zhäk-ė-rē, the name given to the rising of the French peasantry in the 14th century after the battle of Poitiers. They committed great devastations and outrages — burning castles, murdering men and violating women — particularly in the northeast of France. They were at length quelled by the Captal de Buch and Gaston Phébus, count of Foix, who slaughtered 7,000 of them near Meaux. The term *Jacquerie* is derived from *Jacques Bonhomme,* a familiar epithet for a peasant.

Jade, a remarkably tough, compact, ornamental stone, of green to white color and vitreous lustre, used by the prehistoric peoples of Switzerland, Mexico, Alaska, and other countries for axes, utensils and carvings. It is still highly prized in the East, especially in China and New Zealand. Jade is a general term including two distinct minerals, jadeite and the more common nephrite. Jadeite belongs to the pyroxene group and chemically is a soda-spodumene, easily fusible (at 2.5) and having a specific gravity of 3.3 to 3.35. Nephrite is a variety of amphibole identical with tremolite when of white color, or with actinolite when green, fusing much less easily (at 4) and with specific gravity of 2.95 to 3.0. Much information as to jade and implements made from it may be found

in the publications of the Smithsonian Institution, especially a paper by S. Blondel, 'A Historical, Archæological and Literary Study of Jade,' in the annual report for 1876.

Jad'win, Edgar, American military engineer: b. Honesdale, Pa., 1865. He studied at Lafayette College, was graduated from West Point in 1890, was an assistant in government engineering in 1890–1 and again from 1893, in the Spanish-American War was successively major and lieutenant-colonel of the 3d United States volunteer engineers, and for a time commanded a battalion of this regiment in the sanitation of Matanzas, Cuba. Promoted captain in the corps of engineers, U. S. A. (1900), he was appointed (1902) to direct all Pacific coast fortification and river and harbor work south of San Francisco.

Jæger, yā'gėr. See GULL; SKUA.

Jaffa, jăf'fạ or yäf'fä (ancient JOPPA; Ar. *Yafa;* Heb. *Yapho,* beauty), Asiatic Turkey, in the western part of Palestine on the Mediterranean Sea; about 35 miles from Jerusalem. Jaffa is an old Phœnician town mentioned in several places in the Bible. It was the port of entry for Jerusalem and for several of the interior cities of Palestine. Here the cedars from Lebanon were landed and then carried overland for the building of the Temple in Jerusalem. The house where Simon the tanner lived, and where Saint Peter lodged, is still pointed out. In 1187 it was taken by Saladin, in 1191 by Richard I. In 1799 it was captured by Napoleon, who here put to death 1,200 Turkish prisoners. The narrow entrance to the harbor is extremely dangerous. The city is built on a high rocky coast, and presents today the same irregular arrangement of streets, and unattractive looking houses that it may have had hundreds of years ago. The remains of Roman fortifications and dwellings are in the vicinity. The old road to Jerusalem is extremely interesting; but a railroad, built in 1892, connects the city with Jerusalem. The chief exports are oranges (said to be the finest in the world), other fruits, soap, sesame, wine, oil, raw silk, and nuts. The chief imports are sugar, rice, lumber, cotton goods, petroleum, tobacco, and silk goods. The city contains several mosques, a Franciscan monastery, and a mission school. Some attempts have been made to establish colonies of Jews on land near Jaffa. Pop. (1903) estimated, 30,000.

Jagannath, or **Juggernaut** (Sanskrit, *Jagannâtha,* lord of the world, one of the names of Vishnu), called by the natives Puri, a town and celebrated temple of Hindustan, in the presidency of Bengal, province of Orissa, on the Bay of Bengal, 48 miles south of Kattack. The town derives all its importance from the temple. This, the most celebrated shrine in Hindustan, was completed in the 12th century, at an enormous expense. The main street, at the extremity of which the temple stands, consists entirely of religious structures built of stone. The gardens here produce the finest fruits in the province. The temple stands near the shore, in a waste, sandy tract, and appears like a shapeless mass of stone. The idol is a carved block of wood, with a hideous face, painted black, and a distended blood-red mouth, and is magnificently dressed. On festival days the throne of the image is placed on a high tower moving on wheels. Long ropes are attached to the tower, by which the people draw it along. The belief that devotees used to cast themselves headlong in front of this car to be crushed to death probably grew out of the accidental fatalities sometimes occurring. Every year pilgrims flock in crowds to the temple.

Jagersfontein (yā'gėrz-fŏn-tīn) **Excelsior, The,** a name given the largest known diamond; found in the mine of the Jagersfontein Company, Orange Free State, South Africa, in 1893; weight, 971 carats; color, blue white.

Jag'ger, Thomas Augustus, American Protestant Episcopal bishop: b. New York 2 June 1839. He was graduated from the General Theological Seminary, New York, and ordained deacon in the Protestant Episcopal Church 1860. While serving as rector of Holy Trinity parish, Philadelphia, Pa., he was elected to the newly formed diocese of Southern Ohio, and consecrated May 1875. He is the author of 'The Men of the Ages'; 'The Ministry of Phillips Brooks'; 'The Personality of Truth,' the Bohlen lectures for 1900.

Jag'gery, a coarse brown sugar made in the East Indies by the evaporation of the juice of several species of palms, chemically the same as cane-sugar. The sap which yields jaggery becomes by fermentation palm-wine, and from it arrack (q.v.) is distilled. See PALM.

Jaguar, jăg'ū-ăr or jăg'wär, a great American spotted cat (*Felis onca*), once numerous as far north and east as Arkansas, but since the early part of the 19th century rare even in Mexico. It resembles the leopard, but is more robust (exceeding the cougar in weight), has a rounder head, relatively shorter legs and a shorter, thicker tail. The tawny yellow hide is spotted with black, the spots larger than those of the leopard, and inclined to form broken rings with a spot in the centre. Jaguars abound in the tropical forests, especially along the great rivers, where they find most prey. They subsist largely on capybaras, agoutis, etc., but frequently pounce upon deer when they come down to drink. They seem to be more arboreal than most large cats, and a favorite method of obtaining their food is to lie along a tree-limb in some favorable spot and leap down upon the victim. But jaguars also abound in the treeless morasses of the Gran Chaco, and even on the dry uplands of Paraguay and Argentina, where their food and habits are entirely different from those who dwell in the forests. In view of the great extent of country and variety of circumstances in which this animal occurs, formal statements as to its habits are rarely more than locally true; and much error and superstition encumbers popular accounts. In general the jaguar has the manners and disposition of other great cats, changing with environment, season and circumstances. It submits grudgingly to captivity, and gives the same reluctant submission to the training of the circus as is exhibited by other great cats. In some regions it is greatly feared by the people, while in other places it is regarded as little to be feared. Its greatest peculiarity, perhaps, is the tendency to terrific roars and cries, more loud and continuous than those of cougars or leop-

SOUTH AMERICAN JAGUAR AND TAPIR

ards. Consult the works of South American travelers and naturalists, especially Humboldt, Azara, Walterton, Wallace, Bates, and W. H. Hudson. Their accounts are well summarized by Porter in 'Wild Beasts' (New York 1894).

Jaguarondi, jăg-wa-rŏn'dĭ, or **Yaguarondi,** a slender, long-tailed, unspotted, blackish-gray wildcat (*Felis jaguarondi*) of tropical America. It is not common, and is little known. It measures about 30 inches from snout to tail, and the tail is 25 inches long; and the sides of its nose are curiously pinched in.

Jains, jīnz, or **Jainas,** jī'näz, a Hindu religious sect, which in union with the Buddhists opposed Brahmanism. They are numerous in the great cities of western and northwestern India, as well as in the Dravidic states of the South. The name signifies a follower of Jina ("conqueror of the world"), one of the denominations of their apotheosized saints. They have many fine temples built in different parts of the Deccan, as well as elsewhere. The Jains deny the divine origin and infallible authority of the Vedas; they reverence certain holy mortals, now termed Tirthankara or saints, and they manifest extreme and even ludicrous tenderness for animal life. They positively affirm that the world exists from all eternity, not being created by God or any other being, and that it will exist forever. This world is divided into three parts — the upper, the middle, and the lower worlds. The Jains believe that not to kill any sentient being is the highest virtue; and lying, covetousness, theft, are strongly condemned. Not to eat at night, and to drink water strained (for fear of its containing any insect), not to drink arrack, are important injunctions. Various fruits and vegetables they will not eat even under the pressure of starvation, and any kind of flesh meat they will not touch with the hand. They believe in a sort of nirvâna (like the Buddhists). Those who attain to this nirvâna, this extinction of action, this final liberation, do not return to a worldly state, and there is no interruption to their bliss; they have perfect vision and knowledge, and do not depend upon works. The Jains are split up into two principal divisions, Digambaras and Svêtâmbaras; the points of difference between them are said to comprehend a list of 700 topics, 84 of which are considered of paramount importance. The Digambara (sky-clad, naked) now wears colored garments, confining the disuse of clothes to meal hours; the Svêtâmbara wears, as the name signifies, white garments.

Jal'ap (so called from Jalapa, or Xalapa, Mex., whence it is imported), the tuberous roots of several plants of the order *Convolvulaceæ*, that of *Ipomœa purga* being the most important. This is a twining herbaceous plant with cordate leaves and deep pink flowers, growing naturally on the eastern declivities of the Mexican Andes, at from 5,000 to 8,000 feet. The jalap of commerce consists of irregular ovoid dark-brown roots, varying from the size of an egg to that of a hazel-nut.

Jalapa, hä-lä'pä, or **Xalapa,** Mexico, city, capital of the State of Vera Cruz. Spelled Jalapa by the public generally, and most frequently by the Federal Government, but Xalapa always in official documents of the city itself and of the State of Vera Cruz. Elevation 4,689 feet above the sea. One of the oldest and most picturesque cities in the Republic. Distant from the City of Mexico by the Interoceanic railway 350 miles, and from the city of Vera Cruz, 116 miles. Population about 30,000. Was granted the title of "town" or "village" in 1791, by the King of Spain, together with the right to use a coat of arms (five hills with a star above, the whole surrounded by a border of gold alternating with letters composed of roots and flowers forming the name Xalapa,— a helmet and herald staff occupying a conspicuous position in the upper part. On the lower part appears a cornicopia, a laurel and a palm). The name Xalapa signifies five hills. Long before the coming of the Spaniards the town was a place of considerable importance, having been founded by the native Indians. It became a city in 1830, and the seat of the Bishopric of Vera Cruz in 1864. That it possesses very agreeable climatic qualities may be inferred from the fact that its average temperature the year round is 66° in the shade. There are several plazas, cotton mills, cigar manufactories and tanneries, a chocolate factory, a soda water factory and numerous small shops. The educational facilities are most excellent, and include a Normal School, with a valuable chemical laboratory, physical and natural history collection, library, gymnasium and a corps of 20 professors and teachers, a Female College, a School of Fine Arts, a Preparatory College and a most creditable aggregate of well conducted primary schools. Two railways,— the Interoceanic and the Xalapa & Cordova,— provide ample transportation facilties, and the financial needs of the community are looked after by a branch of the Mercantile Bank of Vera Cruz, and agencies of the National Bank and the Bank of London and Mexico. The Palace of the state government, which has recently been materially enlarged, is a spacious and most attractive building. A few miles distant and near the line of the Xalapa & Cordova railway, are the beautiful falls of Xico, which furnish the power for the city's electric lighting. There is the usual complement of churches; but the old convent of San Francisco, which dates back to 1555 and is now the Cathedral is particularly interesting from both a historic and artistic point of view. There are two museums,— those of the Preparatory College and the Primary School. The libraries of the Preparatory College, the Normal College, and of Fernando J. Corona contain altogether 11,000 volumes.

Jalisco, hä-lēs'kō, Mexico, a state bounded on the west by the Pacific Ocean, and on the north, east, and south by the states of Durango, Zacatecas, Aquascalientes, San Luis Potosí, Guanajuato, Quenetaro, Michoacan, Colima, and the territory of Tepic. The Sierra Madre range in the eastern portion of the state includes the active volcano Colima (about 14,238 feet) and other high mountains. The largest river is the Santiago, or Lerma. (See MEXICO — THE STATES OF.)

Jamaica, ja-ma'ka, the largest of the British West India Islands. It occupies the central position in the Antillean region, being nearly equidistant from Florida and the northern point of South America; from the mouths of the Orinoco and Galveston; from the head of the

Gulf of Honduras, on the west, and St. Thomas, on the east. Its greatest length is 144 miles; greatest breadth, 49 miles; area, 4,200 to 4,218 square miles. The eastern part of the island has, as its most commanding feature, the Blue Mountain range (highest peak 7,360 feet). The centre and west, an elevated plateau of later geologic formation, show the characteristic Antillean limestone, and, more perfectly here than elsewhere in the West Indies, the extraordinary results of exposure of that soluble material to the tropical rainfall. This upland plain, by the action of the elements, has been carved into hills, basins, called "cockpits," 500 feet or more in depth, and much larger and deeper valleys, in which the plantations are situated, and from which the numerous streams often find their way to the sea by underground passages. One of these depressions, the Clarendon Valley (drained through a cañon), is 25 miles wide and 50 miles long; another, St.-Thomas-in-the-Vale, is circular in form, with a diameter of about 10 miles. Throughout the western half of the island such valleys occur, some with, others without, apparent drainage outlets. Coastal plains are most extensive on the south side, where the largest, the plain of Liguanea, has an area of 200 square miles. There are no navigable rivers, but a great number of small streams, pools, and thermal springs. In the limestone region there are many caverns, interesting on account of their size, beauty, or the relics of the old Indian population which they contain. The mean temperature at the coast is very little more than 78° F.; that of the larger part of the habitable regions (1,000 to 3,000 feet above sea-level) is about 73° F.; and at the altitude of 5,500 feet it is 60° F. The maximum for a period of 10 years at Kingston, on the south coast, averaged 87.8° F., and the minimum 70.7° F. On the plateau the annual variation is scarcely 9°; for example, at St. Elizabeth the maximum is 75° F. and the minimum 67° F. As a whole, the island has a pleasant climate. The average rainfall is 66 inches, the extremes being 100 inches on the high mountains and 44 inches at Kingston. The death-rate is 20.9 in 1,000; but this favorable showing, as compared with the other islands of the Antilles, is due much less to natural advantages than to the strict enforcement of local sanitary and quarantine regulations. The total number of inhabitants in 1903 is estimated at about 780,000. The census of 1891 showed 639,491, five sixths of the entire population being blacks or colored people; the whites numbering 14,692, and East Indian coolies 10,116. The birth-rate is little less than twice the death-rate. The Jamaican negroes are fairly good laborers when well fed; the menial work of the island is performed by them, and they are regarded as cheerful, honest, and respectful servants. They have no share whatever in the government.

Fauna, Flora, and Agriculture.— Jamaica has no native mammals. There are many species of lizards, including the large iguana, a few harmless snakes, and the slightly poisonous centipede and scorpion; in the lowlands mosquitoes, ants, and sand-flies are common; butterflies, fireflies, and beetles, parrots, pigeons, water-fowls, and 20 different kinds of song-birds are enumerated. Edible marine fish are seldom caught near the island, but the streams contain a few fresh-water species. The flora is distinguished from that of the other Antillean regions by the total absence of the royal palm, and by the abundance of pimentos, or allspice-trees, which are found nowhere else. Common trees are the ceiba, mango, wild orange, cocoa-palm, plantain, fustic, logwood, and cedar. Begonias, orchids, ferns, and grasses abound, except on the southern coast, which has a flora of the arid type, including the cactus, thorny acacias, etc. There are 739,256 acres under cultivation (tillage 200,168, pasturage 413,152, etc.). Of this total, 83,549 acres are devoted to pimento (allspice), but chiefly as a by-product on lands also used for stock-raising. Since the abolition of slavery the production of sugar has fallen off very greatly. In 1805 Jamaica exported 151,000 hogsheads of sugar, and 5,000,000 gallons of rum; in 1897 the cultivation of sugar-cane constituted only 19 per cent of the whole agricultural industry; in 1902 only 27,342 acres were under this crop. Other products have gradually taken its place, as shown in the following statement of areas devoted to them: Ground provisions, 91,733 acres; coffee, 31,265 acres; bananas, 32,842 acres; cocoanuts, 13,244 acres; etc. Since the great frosts in Florida (1895–6) the exportation of oranges from Jamaica has been carried on profitably; since 1886 tobacco has been grown and cigars for exportation made on a large scale. Coffee from the Blue Mountain estates is of fine quality. The cultivation of cocoa has increased in recent years; ginger grows most readily in the rich soils on the mountains; and among the other exports may be mentioned annatto, lime-juice, tamarinds, nutmegs, a number of dye-woods, cabinet-woods, etc. Special instruction in agriculture is given at the schools, and agricultural and horticultural interests are encouraged by the government and active private associations.

Commerce, Railways, Roads, etc.— The United States has the most important trade relations with Jamaica, furnishing a large part of the staple food supplies, and affording the best market for the island's fruit and sugar. Thus, in 1895–6, the total exports were valued at $8,900,000, the United States taking 57 per cent, and Great Britain 27.6 per cent. Imports in the same year amounted to $13,722,500, Great Britain, Canada, and other British possessions furnishing about 55.6 per cent, and the United States 41.8 per cent. There are about 185 miles of railway, 683 of telegraph, and 154 of telephone. In the year 1901–2 the number of letters and postal-cards transmitted by the post-office was 5,424,814. The system of public highways (3,600 miles), extending into all parts of the island, is admirable: the roads are thoroughly well built and graded, have substantial bridges, and are kept in good repair. The principal line of steamships is the Royal Mail, with fortnightly sailings between England and the Caribbean ports. The Atlas Line and the Boston Fruit Company's steamers maintain communication with New York, Boston, Philadelphia, and Baltimore. A steamer from Kingston circumnavigates the island once a week.

Government, Education, and Religion.— The executive authority is vested in a governor, appointed by the king. He is assisted by a secretary, attorney-general, director of public works, collector-general, and the commanding officer of the military forces. The legislative council consists of 29 members, with the governor as

president; of the whole number 14 are elected (term 5 years), 10 nominated, and 5 are the administrative officers mentioned above. Admittance to the lower grades of the civil service is gained through competitive examinations. The government medical service has in charge 18 public hospitals. The police system includes more than 100 stations in different parts of the island; a force of more than 1,500 men (769 district constables); several prisons, reformatories, and industrial schools. In 1902 the strength of the regular forces stationed in Jamaica was 1,866 officers and men; militia, 763. Fortifications and batteries are at Port Royal, Rocky Point, Salt Pond's Hill, Rock Fort, Fort Augusta, Fort Clarence, and Apostles' Battery. Ships of the royal navy on the North American and West India station are 13 in number (see also below in connection with Kingston). The judicial department includes a high court of justice (9 members), circuit courts, and a magistrate in each parish. Public revenue and expenditure in recent years, each about $3,000,000; the public debt in 1897 was given as $7,581,000. Government schools in 1902 numbered 728, with 84,779 pupils. There are four government training colleges for teachers; several endowed secondary, industrial, and high schools; a public lyceum and museum, with a valuable library, etc. Local examinations are held on the island by the University of Cambridge. In 1870 the Church of England was disestablished and disendowed on the island; in 1902 churches and chapels were: Church of England, 219; Baptist, 189; Methodist, 128; Presbyterian, 73; United Methodist Free Church, 43; Roman Catholic, 28; Moravian, 27; Congregational, 26; Christian Church, 20; and Church of Scotland, 10.

Dependencies.— The Cayman Islands, Turks, and Caicos Islands, and the Morant and Pedro Cays are attached to Jamaica for administrative purposes. Of these, the first group lies in the Caribbean Sea, 180 miles northwest of Jamaica, and comprises Grand Cayman, 17 miles long, 4 to 7 broad; Little Cayman, 9 miles long and about 1 mile broad; and Cayman Brae, 10 miles long and 1 mile broad. The government is administered by a commissioner, and magistrates are appointed by the governor of Jamaica. The population of the Cayman Islands is about 4,300. The second group, Turks and Caicos Islands, situated nearly 500 miles northeast of Jamaica, geographically belongs to the Bahamas; but the governor of Jamaica exercises a supervising power over the local authorities (a commissioner and legislative board of 5 members). Area, 165½ square miles; population, 5,350; capital, Grand Turk; products, salt, sponges, pink pearl, etc. The Morant Cays and Pedro Cays are situated, respectively, about 33 miles southeast, and about 45 miles southwest, of Jamaica.

Chief Towns.— Kingston, the capital, has 46,542 inhabitants, a good water-supply and system of sewerage, well-lighted streets, large shops, a street-railway, etc. The town is, however, unattractive; residences of the officials and wealthy merchants are built in the suburbs. Public institutions are the museum, library, colonial offices, schools, churches, almshouse, penitentiary, asylum, and Victoria Market. Four miles away is the important naval station of Port Royal, headquarters for the British West India naval forces, and a strongly fortified place. Spanish Town, population 5,019, at one time the capital, is situated 15 miles west of Kingston. Port Antonio, on the northeast side of the island; Montego Bay, population 4,803; Savanna-la-Mar, Falmouth, Lucea, St. Ann's Bay, Buff Bay, Port Morant, Black River, etc., are distributed among the three counties of Surrey, Middlesex, and Cornwall.

History.— The native word from which we have the name Jamaica signifies "island of fountains." Names recalling the old Spanish occupation of the island are Montego (Spanish Manteca), Bog Walk (Spanish Boca del Agua), Wag Water (Spanish Agua Alta), and others. As a Spanish colony (1509–1665) Jamaica was backward and of little consequence; the total population in the year last mentioned, when an English fleet captured it, was only 3,000. One half of that number took refuge in Cuba. The settlers who arrived subsequently were peasants from Scotland, Ireland, and England, English subjects from the other West Indian islands, and Jewish traders from Minorca. Negroes were brought from Africa in great numbers; the old town of Port Royal being chosen as a convenient point from which to reship slaves to the other islands and the mainland. That town, once a place of great wealth and importance, was ruined by repeated calamities. "On 7 June 1692 happened that earthquake which swallowed up great part of Port Royal," says Edwards, who explains that the town "was chiefly built on a bank of sand, adhering to a rock in the sea, and a very slight concussion, aided by the weight of the buildings, would probably have accomplished its destruction." Hurricanes in 1712 and 1722, and a conflagration 13 July 1815, completed the work of obliteration. Toward the close of the 18th century the island was occupied by large plantations, and was exceedingly productive. Before that time 610,000 slaves had been landed at Port Royal. The freeing of the negroes (see EMANCIPATION) resulted in the abandonment of the island by many landlords. The effort to regain the lost prosperity through diversified agriculture has already been mentioned. In August 1903 a hurricane inflicted great injury at several points in Jamaica, and on the Cayman Islands. In January 1907 Jamaica was visited by a disastrous earthquake which almost entirely destroyed Kingston. Loss about $10,000,000 and 1,000 lives.

Consult: Hill, 'Cuba and Porto Rico, with the other Islands of the West Indies'; and Edwards, 'History of the British West Indies.'

MARRION WILCOX,
Authority on Spanish America.

Jamaica, a part of the borough of Queens in the city of New York. Prior to 1 Jan. 1898 Jamaica was the county-seat of Queens County on Long Island, but that portion of Queens County in which Jamaica is situated has been incorporated in the city of New York (Greater New York). The town was settled as early as 1656. Several houses built before the Revolutionary War are in a good state of preservation. In the vicinity there are a large number of market gardens. One of the New York State normal schools is situated in Jamaica.

Jamaica Bay, an inlet of the Atlantic Ocean which indents the southeast shore of Long Island. It is nearly circular in shape; the Rockaway Beach extends across the side toward the ocean and makes of the bay a land-locked body

of water. A number of islands are in the middle and at the entrance. The whole of the bay, except an inlet, Head Bay on the east shore, is within the limits of New York city; Coney Island is near the entrance to the bay.

James, Saint, called the «Greater,» the son of Zebedee. He was called to be an apostle, together with his brother Saint John, as they were mending their nets with their father, who was a fisherman. They then followed Christ, were witnesses with Saint Peter of the transfiguration, and accompanied our Lord in the garden of Gethsemane. In the lists of the apostles given in the synoptic Gospels and in the Acts the names of Peter, Andrew, James, and John stand first; and it is plain that these four were at the head of the 12 throughout. After the ascension Saint James persevered in prayer with the other apostles and the women and the Lord's brethren. Nothing further is certainly known of him till the passover of 44, when, being in Jerusalem, the Jews stirred up Herod Agrippa I. against him, who put him to a cruel death. Thus Saint James was the first of the apostles who suffered martyrdom. There is a legend that he went to Spain, and that his bones lent miraculous aid to the Spaniards against the Saracens.

James, Saint, called the «Less,» an apostle, the brother or cousin of Jesus. He is called in Scripture the «Just,» and is probably the apostle described in Matt. x. 3 and elsewhere as the son of Alpheus. He was the head of the church in Jerusalem when the Scribes and Pharisees threw him down from the gable of the temple, and a fuller dashed out his brains with a club, about the year 62. This is the account of his death given by Hegesippus, a Christian of Jewish origin, who lived in the middle of the 2d century, and it differs somewhat from the narrative of Josephus. Some critics maintain that James, the son of Alpheus, was one person, and James, the brother of Jesus, another. Whether James was the author of the epistle which bears his name is considered doubtful.

James I., king of England, and VI. of Scotland, the only child of Mary, Queen of Scots, by her cousin Henry Stuart, Lord Darnley: b. Edinburgh Castle 19 June 1566; d. palace of Theobalds, Hertfordshire, 27 March 1625. In 1567 he was solemnly crowned at Stirling, and from that time all public acts ran in his name. His childhood was passed in civil wars, under the regencies of Murray, Mar, and Morton, during which time he resided in Stirling Castle, under the tuition of the celebrated Buchanan. From the first he seems to have imbibed those exalted notions of the royal authority and divine right which proved so injurious to his posterity. But James soon found it advisable to ally himself with Queen Elizabeth and accept a pension from her. When, however, it became apparent that the life of his mother was in danger from the sentence of an English judicature, James sent representatives to England to intercede with Elizabeth; but his whole procedure in the matter shows a singular callousness. As a matter of form he ordered the clergy to pray for his mother, but when the news of Mary's execution arrived James was not much moved, though he attempted to make a show of indignation by condemning one of the commissioners to death, a sentence which, however, he commuted to banishment. On 23 Nov. 1589 James married Anne, daughter of Frederick II., king of Denmark. On his return home, after passing the winter in festivities at Copenhagen, he was in some danger from the unruliness of the nobles; and for several succeeding years of his reign the history of Scotland displays much turbulence and party contest. In 1603 James succeeded to the crown of England, on the death of Elizabeth, and proceeded amidst the acclamations of his new subjects to London. One of his first acts was to bestow a profusion of honors and titles on the inhabitants of both countries. At a conference held at Hampton Court between the divines of the Established Church and the Puritans James exhibited the ill-will he bore to popular schemes of church government. The meeting of Parliament also enabled him to assert those principles of absolute power in the crown which he could never practically maintain, but the theoretical claim of which provided the increasing spirit of freedom in the House of Commons with constant matter of alarm and contention. Although James had behaved with great lenity to the Catholics in Scotland, those in England were so disappointed in their expectations of favor, that the famous gunpowder plot was concerted in 1605, the object of which was to blow up the king and Parliament. (See GUNPOWDER PLOT, THE.) In 1612 he lost his eldest son Henry, a prince of great promise, then 19; and in the following year the eventful marriage of his daughter Elizabeth with the elector palatine took place. No circumstance in the reign of James was more unpopular than his treatment of the celebrated Sir Walter Raleigh (q.v.). James had set his heart on marrying his son Charles to a Spanish princess, but the negotiations failed through the overbearing temper of Buckingham, the royal favorite, who quarreled with the grandees of the Spanish court. The close of the life of James was marked by violent contests with his Parliament. He was also much disquieted by the misfortune of his son-in-law, the elector palatine, who, having been induced to accept the crown of Bohemia, and to head the Protestant interest in Germany, was stripped of all his dominions by the emperor. Urged by national feelings for the Protestant cause, he was at length (10 March 1624) induced to declare war against Spain and the emperor; and troops were sent to Holland to act in conjunction with Prince Maurice. James was not destitute of abilities nor of good intentions, but the former were not those of a ruler, and he was neither beloved at home nor esteemed abroad. He received during his lifetime a great deal of adulation on the score of his literary abilities. Consult: Aikin, 'Memoirs of the Court of King James the First' (1822); Burton, 'History of Scotland' (1873); Macaulay, 'History of England' (1858); S. R. Gardner, 'History of England from the Accession of James I. to the Spanish Marriage' (1863–9); ibid., 'The First Two Stuarts' (1876).

James II., king of England, second son of Charles I. and of Henrietta of France: b. London 15 Oct. 1633; d. St. Germain, France, 16 Sept. 1701. He was at once declared Duke of York, though only formally raised to that

dignity in 1643. At the Restoration in 1660 he took the command of the fleet, as lord high-admiral, and was also made Warden of the Cinque Ports. He had previously married Anne, daughter of Chancellor Hyde, afterward Lord Clarendon (q.v.). In 1671 the Duchess of York died. Before her death she declared herself a convert to the Roman Catholic faith, which had been secretly that of the duke for many years, and was now openly avowed by him. This declaration laid the foundation of the opposition which finally drove him from the throne. A test act being soon after passed, to prevent Roman Catholics from holding public employments, the duke was obliged to resign his command. On 21 Nov. 1671 he married Mary Beatrice of Este, daughter of the Duke of Modena, and in 1677 his eldest daughter, Mary, was united to William, prince of Orange.

On the death of Charles II., 6 Feb. 1685, the duke succeeded, under the title of James II., and from the time of his ascending the throne seems to have acted with a steady determination to render himself absolute, and to restore the Roman Catholic religion. At variance with his Parliament he was under the necessity of accepting a pension from Louis XIV. He sent an agent to Rome to pave the way for a solemn re-admission of England into the bosom of that Church, conduct which encouraged the rebellion of the Duke of Monmouth. The unrelenting temper of James was again exhibited in the executions on this account. The legal proceedings under Jeffreys were brutal in the extreme; and no fewer than 320 persons were hanged on the western circuit alone, which attained an unenviable notoriety as the Bloody Assize. He gradually proceeded to a direct attack on the Established Church, by the formation of an ecclesiastical commission, which cited before it all clergymen who had done anything to displease the court. Apparently to conciliate the Puritans a declaration of indulgence in matters of religion was ordered to be read by the clergy in all the churches of the kingdom, but its real object, however, was to favor the Roman Catholic element. Seven bishops met and drew up a loyal and humble petition against this ordinance, and for this act they were sent to the Tower, on a charge of seditious libel. On 29 June 1688 they were acquitted amid the most enthusiastic rejoicings of the populace. The innovations, in regard both to the religion and government, gradually united opposing interests, and a large body of nobility and gentry concurred in an application to the Prince of Orange, signed by seven of the most prominent and influential political leaders, to occupy the throne. James, who was long kept in ignorance of these transactions, when informed of them by his minister at the Hague, was struck with terror equal to his former infatuation; and, immediately repealing all his obnoxious acts, practised every method to gain popularity. All confidence was, however, destroyed between the king and the people. William arrived with his fleet in Torbay 5 Nov. 1688, and landed his forces, amounting to 14,000 men. Several men of rank went over to William, and the royal army began to desert by entire regiments. Incapable of any vigorous resolution, and finding his overtures of accommodation disregarded, James resolved to quit the country. He repaired to St. Germain, where he was received with great kindness and hospitality by Louis XIV. In the meantime the throne of Great Britain was declared abdicated, and was occupied, with the national and parliamentary consent, by his eldest daughter, Mary, and her husband, William, conjointly; Anne, who had equally with her sister been educated a strict Protestant, being declared next in succession, to the exclusion of her infant brother, known in history as the Pretender, who had been born on 10 June of that year. Assisted by Louis XIV., James was enabled, in March 1689, to make an attempt for the recovery of Ireland. The battle of the Boyne, fought 1 July 1690, compelled him to return to France. All succeeding projects for his restoration proved equally abortive. Consult: Burnet, 'History of the Reign of King James the Second'; Cavelli, 'Les derniers Stuarts à Saint Germain-en-Laye' (1871); Klopp, 'Der Fall des Hauses Stuart' (1875–88).

James I., king of Scotland, of the house of Stuart: b. Dunfermline 1394; d. Perth 21 Feb. 1437. He was the son of Robert III. In 1406, while on his way to France, he was taken by the English and carried to the Tower of London. For the next 18 years he remained a prisoner in England, being confined during part of his captivity in Nottingham Castle, Evesham, and Windsor Castle, where he wrote the 'King's Quhair' and other poems. Robert III. died very shortly after learning of his son's captivity, and James was proclaimed king; but during the remainder of the reign of Henry IV., and the whole of that of Henry V., he was detained in England, with a view to prevent the alliance of Scotland with France. In 1424, under the regency of the Duke of Bedford, he was restored to his kingdom, at which time he was in his 30th year. Previous to his departure he married Jane or Joanna Beaufort, daughter of the Earl of Somerset, a lady of the blood royal of England, who is the fair dame alluded to in his poem 'The King's Quhair.' On his return to Scotland he restored Scotland to some degree of order, but so severe was his treatment of his turbulent nobles that he was at last murdered by their emissaries at Perth in the 13th year of his reign.

James II., king of Scotland, son of James I.: b. 16 Oct. 1430; d. Roxburgh, Scotland, 3 Aug. 1460. During the minority his kingdom was distracted by struggles for power between his tutors Livingston and Crichton and the great house of Douglas. In 1449 he assumed the government and married Mary of Guelderland. He had latterly allied himself with the Douglases, but being deprived of all real power, he resolved to free himself from their yoke. This he did in 1452 by inducing the Earl of Douglas to come to Stirling Castle, where he stabbed him with his own hand. He then quelled a powerful insurrection headed by the next earl, whose lands were confiscated. In 1460 he infringed a truce with Henry VI. of England by besieging the castle of Roxburgh, and was killed by the bursting of a cannon in the 29th year of his age.

James, III., king of Scotland, son of James II.: b. 10 July 1451; d. 11 June 1488. He was crowned at Kelso on his father's death, but in 1465 came under the influence of Bishop Ken-

nedy and the Boyd family, one of the latter espousing the king's sister in 1467. James married Margaret of Denmark in 1469 and dismissed the Boyds from favor only to advance other favorites. Prominent among these was Cochrane, through whom one brother of James was obliged to flee the kingdom, and another was put to death. The nobles seized Cochrane and five others and hanged them. Subsequently a plot was formed to dethrone the king, and though many peers remained loyal to him the royal army was defeated at Sauchie, near Stirling. James escaped from the field, but was murdered during his flight.

James IV., king of Scotland: b. 17 March 1473; d. Flodden 9 Sept. 1513. He was the son of James III. He commanded the nobles who vanquished and killed his father at Sauchieburn, and was crowned at Scone in June 1488. He married Margaret, the daughter of Henry VII. of England, but taking umbrage at the hostile attitude of his brother-in-law, Henry VIII., allied himself with France. He was defeated and slain at the battle of Flodden (q.v.) during an invasion of England.

James V., king of Scotland, son of James IV.: b. Linlithgow, Scotland, 10 April 1512; d. Falkland Palace 14 Dec. 1542. He came to the throne under the regency of his mother in 1513 and assumed the reins of government in 1528. He married Madeleine of France in 1537, and on her death married the daughter of the Duke of Guise, Mary of Lorraine, in 1538. He ruled with much vigor and decision, and on account of his mingling freely with his people was called "the king of the commons." Becoming entangled in war with England in 1542 he was defeated at the battle of Solway Moss and died a month later. He was succeeded by his daughter, Mary, Queen of Scots, who was but seven days old at his death.

James, Bushrod Washington, American oculist: b. Philadelphia 25 Aug. 1836. He was graduated from the Homœopathic Medical College of Pennsylvania in 1857, became well known as a practitioner, was elected president of the Pennsylvania Homœopathic Medical Society in 1873, of the American Institute of Homœopathy in 1883, and in 1896 was vice-president of the Homœopathic Medical Congress held at London, England. His publications include: 'American Climates and Resorts' (1889), a manual of climatology (1889); 'Alaskana' (1892); 'Echoes of Battle' (1895); and 'Alaska: Its Neglected Past and its Brilliant Future' (1897; rev. ed. 1901).

James, Charles, English novelist and playwright: b. London 26 Dec. 1858. He received a private education, became lieutenant-colonel of the Royal West Kent regiment, and published: 'A Bird of Paradise' (1889); 'The New Faith' (1890); 'Honors Easy' (1892); 'A Worker in Iron' (1894); 'At the Sign of the Ostrich' (1895); and 'Where Thames is Wide' (1896); etc.

James, Edmund Janes, American college president: b. Jacksonville, Ill., 21 May 1855. He was educated at Northwestern University and at Harvard, was principal of the high schools at Evanston and Normal, Ill. (1878–82), professor of public finance and administration in the Wharton School of Finance and Economy of the University of Pennsylvania (1883–95), and professor of political and social science in the university (1884–95). In 1896 he became professor of public administration in the University of Chicago and director of the extension division; in 1902 president of the Northwestern University; and in 1905 president of the University of Illinois. He became president of the American Academy of Political and Social Science in 1889, and in 1891–5 was president of the American Society for the Extension of University Teaching. His writings include: 'The Legal Tender Decisions' (1887); 'The Canal and the Railway' (1890); 'The Federal Constitution of Germany' (1890); and 'The Growth of Great Cities in Area and Population' (1900).

James, Florence, "Florence Warden," English novelist: b. Hanworth, Middlesex, 16 May 1857. She taught as a governess, 1875–80, and was on the stage, 1880–5. Her novels, many of which are strongly sensational in tone, have been very popular in this country as well as in England. They are published under the pseudonym "Florence Warden," and among them are: 'At the World's Mercy'; 'The House on the Marsh,' which established her reputation; 'A Prince of Darkness'; 'Scheherezade'; 'A Perfect Fool'; 'Pretty Miss Smith'; 'A Lady in Black' (1897); 'A Very Rough Diamond'; 'Morals and Millions'; 'One too Often' (1901); 'A House with a History.'

James, George Payne Rainsford, English novelist and historian: b. London 9 Aug. 1801; d. Venice 9 May 1860. As a young man he traveled widely on the Continent. He began his writing under the influence of Scott's novels, and wrote in all over 100 novels; he was also known as the author of popular historical books, and in 1839 was appointed historiographer royal, in this capacity writing 'History of the United States Boundary Question' and 'The Corn Laws.' In 1850 he was British consul in Massachusetts, two years later was transferred to Norfolk, Va., and in 1856 became consul general at Venice. His novels include: 'Richelieu' (written 1825, published 1829); 'Darnley' (1829); 'DeLorme' (1830); 'Philip Augustus' (1831); 'Henry Masterton' (1832); 'The Gypsy' (1835); 'Attila' (1837); 'Man at Arms' (1848); 'King's Highway' (1848); 'Agincourt' (1844); 'The Smuggler' (1845); 'Ticonderoga' (1854). His historical works include: 'Memoirs of Great Commanders' (1832); 'Life of the Black Prince' (1836); 'Life of Richard I.' (1842–9). James' novels were very popular when first written, and a new edition appeared in 1903.

James, George Wharton, American explorer, lecturer and ethnologist: b. Gainsborough, Lincolnshire, England, 27 Sept. 1858. He has spent many years in making geological and other researches in California, and elsewhere in the southwestern United States, and is a member of various learned societies in this country and England. He has published: 'The Lick Observatory' (1888); 'Nature Sermons'; 'Picturesque Southern California'; 'Missions and Mission Indians of California'; 'From Alpine Snow to Semi-Tropical Sea'; 'In and Around the Grand Canyon' (1900); 'Indian Basketry'

(1900); 'The Indians of the Painted Desert Region' (1903).

James, Henry, American Swedenborgian theologian: b. Albany, N. Y., 3 June 1811; d. Cambridge, Mass., 18 Dec. 1882. He was educated at Union College and Princeton Theological Seminary, traveled abroad and became a Sandemanian and later a Swedenborgian. He subsequently lived in New York, Newport, R. I., and lastly at Cambridge. Among the most noted of his works on morals and religion are: 'What is the State?' (1845); 'Moralism and Christianity' (1852); 'Lectures and Miscellanies' (1852); 'The Nature of Evil' (1855); 'Christianity the Logic of Creation' (1857); 'Substance and Shadow' (1863); 'The Secret of Swedenborg' (1869). His 'Literary Remains,' edited by William James, appeared in 1885.

James, Henry, American novelist and essayist: b. New York 15 April 1843. He was the son of a clergyman, Henry James (q.v.), who gained fame as a writer on philosophico-theological subjects, first from the Sandemanian, and afterward from the Swedenborgian standpoint. The novelist, known until his father's death as Henry James, Junior, was educated under his father's guidance in New York, Geneva, Paris, and Boulogne. He lived in Europe with his parents during the years 1855–9, and after his return to the United States studied in the Harvard Law School in 1862. He began his literary career about 1865 as a contributor to American magazines, and soon afterward published 'The Story of a Year, a tale of the American Civil War.' In 1869 he took up his residence in Europe, and since then he has resided chiefly in England and Italy. 'Roderick Hudson' (1875) was his first long novel. His subsequent novels include: 'Watch and Ward' (1878), originally published in 1871 in the 'Atlantic Monthly'; 'The American' (1877), by some regarded as his best; 'Daisy Miller' (1878); 'The Europeans: a Sketch' (1878); 'Confidence' (1880); 'Washington Square' (1880); 'A Bundle of Letters' (1880); 'Diary of a Man of Fifty' (1880); 'The Portrait of a Lady' (1881); 'The Bostonians' (1886); 'Princess Casamassima' (1886); 'The Tragic Muse' (1892); 'The Other House' (1896); 'The Spoils of Poynton' (1897); 'What Maisie Knew' (1897); 'The Awkward Age' (1899); 'The Sacred Fount' (1901); 'The Wings of a Dove' (1902); 'The Better Sort' (1903). He has also written a great many short stories, among which are: 'A Passionate Pilgrim, and other Tales' (1875); 'Pension Beaurepas' (1878); 'An International Episode' (1879); 'The Madonna of the Future, and Other Tales' (1879); 'The Siege of London' (1883); 'The Point of View' (1883); 'Tales of Three Cities' (1884); 'The Author of Beltraffio, and other Stories' (1885); 'Stories Revived' (1885); 'The Aspern Papers, and other Stories' (1888); 'The Reverberator' (1888); 'A London Life, and other Stories' (1889); 'The Lesson of the Master, and other Stories' (1892); 'The Real Thing, and other Tales' (1893); 'Picture and Text' (1893); 'The Private Life' (1893), a collection of stories; 'The Album' (1894); 'The Reprobate' (1894); 'Tenants' (1894); 'Disengaged' (1894); 'Terminations, and other Stories' (1896); 'In a Cage' (1898); 'The Two Magics' (1898), consisting of two stories; and 'The Soft Side' (1900), a series of stories. In very many of his stories he describes the life of Americans in Europe, and they depend for much of their interest upon the contrasts between American and European character and institutions. Though a very prolific writer, he is never careless, his style being always felicitous, while in respect to the substance of his work he ranks as the subtlest of American novelists. A dramatic version of 'The American' was produced in London in 1891, but neither it nor his subsequent play 'Guy Domville' (1895) was successful. He has turned his intimate knowledge of modern French literature to good account in his volume of essays entitled 'French Poets and Novelists' (1878). Other works of a similar kind are 'Transatlantic Sketches' (1875); 'Portraits of Places' (1884); 'A Little Tour in France' (1884; new ed. 1900); 'Partial Portraits' (1888); 'Essays in London and Elsewhere' (1893). He also contributed the volume on 'Hawthorne' (1879) in the 'English Men of Letters' series, and in 1903 published 'William Wetmore Story and his Friends,' a notable biography.

James, Thomas Lemuel, American banker: b. Utica, N. Y., 29 March 1831. He early learned the printer's business and bought out a weekly Whig paper, the 'Madison County Journal,' at Hamilton; and in 1856 changed its name to the 'Democrat-Republican,' which was for 10 years the most powerful Republican organ in Madison County. He was collector of canal tolls at Hamilton 1854–85; was appointed inspector of customs in New York 1861; weigher in 1864; and in 1870 was promoted to be deputy collector in charge of the bonded warehouse, which department he immediately proceeded to arrange according to a new system. In 1873 President Grant appointed him postmaster of New York, and he was reappointed by President Hayes in 1877. He filled this office with signal success and originated improvements in the delivery system involving the whole postal methods of the United States. President Garfield in 1881 gave him the portfolio of postmaster-general, and his chief important service during his 10 months' incumbency was his initiation of inquiries which led to the investigation of the Star Route frauds. In 1882 he became president of the Lincoln National Bank of New York.

James, William, American psychologist and philosopher: b. New York 11 Jan. 1842. He is the son of Henry James, theologian (q.v.), and brother of Henry James, novelist (q.v.). He was educated in private schools and by tutors in New York and abroad, studied in 1861–3 at the Lawrence Scientific School of Harvard University, accompanied the Thayer expedition to Brazil in 1864–5, was graduated from the Harvard Medical School in 1870, in 1872 was appointed instructor in anatomy and physiology at the school, and in 1876 assistant professor of physiology. In 1885 he was appointed assistant professor of philosophy in the university, in 1889 professor of psychology, and subsequently professor of philosophy. He was Gifford lecturer on natural religion in the University of Edinburgh in 1899–1901. His best known work has

been done in the domain of analytical psychology, in which he won European recognition. His works are marked by a most readable style and skilful exposition of different topics. He was a founder of the American Society for Psychological Research in 1884, and published: 'Principles of Psychology' (1890); and 'Psychology, Briefer Course' (1892), both popular text-books; 'The Will to Believe' (1897); 'Human Immortality' (1898); 'Talks to Teachers on Psychology' (1899); and 'The Varieties of Religious Experience' (1902).

James Bay, an inlet of Hudson Bay, in the southern part. The bay was named in honor of Captain Thomas James, an English navigator, who explored this body of water in 1631–3. The bay is about 320 miles long and from 140 to 160 miles wide. It contains a number of islands, the largest, Agomska, being about 70 miles in length. Several large rivers flow into James Bay; the Albany, Moose, Noddawai, and East Main are the largest. Moose Factory, at the mouth of Moose River, on the southern shore, is the most important Canadian trading station, next to York Factory, of the Hudson's Bay Company.

James, Epistle of, an encyclical letter addressed to the Jews of the Dispersion. It was written by a Jew for Jewish readers, all of whom are supposed to be subject to the Jewish law. Its date is about 50 A.D., at latest, certainly before the fall of Jerusalem. The epistle was not at first admitted into the canon, and it is not much quoted by the earlier writers, Origen indeed being the earliest we find quoting it by name. Eusebius places it in his list of books controverted but recognized by most (*Antilegomena*), and Jerome expresses the doubt more strongly still. It was finally declared canonical by the third Council of Carthage (397), and already we find it acknowledged by Cyril of Jerusalem, Epiphanius of Cyprus, Athanasius, Gregory of Nazianzus, and all later theologians, down to the time of the Reformation, when it was rejected by Erasmus and Cardinal Cajetan, and stigmatized by Luther as "a downright epistle of straw . . . with nothing evangelical about it," although Calvin thought that it was worthy of an apostle.

The aim of the epistle is throughout ethical rather than doctrinal, Christianity being prominently put forward as the ethical fulfilment of the law, the perfect man being he whose faith has constantly proved itself in practice, and who is patient under all tribulation. It echoes closely the language and method of Christ himself; as Beyschlag says, "essentially it is the teaching of Christ, and thus there is little teaching about Christ." Besides the discourses of the Master, especially his Sermon on the Mount, we find distinct traces of familiarity with the Wisdom of Solomon, and the Ecclesiasticus of the son of Sirach. Formalism, greed of gain, respect of persons, falsehood, evil-speaking, boasting, wrangling and bitterness in debate, attention to dogmatic definitions instead of holiness of life — such are the sins against which the author inveighs with vivid and abrupt invective. His Greek is unusually pure, and some scholars, as Schmidt, Bertholdt, and Bishop Wordsworth, have supposed that the epistle was first written in Aramaic and afterward translated.

The passage in the second chapter (14–26) has been interpreted by many theologians as a direct attack on the Pauline view of faith and justification, that Christ by his death had accomplished a new order of salvation, in which the law, which was merely temporary, was now abrogated, and that thus Christianity had fitted itself to become a universal religion; but Paul's conception is more philosophical and comprehensive, although it by no means excludes the conception of James, whose faith without works is not Paul's justifying faith at all, but the profitless faith without love condemned in 1 Cor. xiii.

The Tübingen school, as might have been expected, claimed the Epistle of James as a polemic against Paul, and made its author a pseudonymous writer of later time, who employed the name of James as an accepted type of spiritualized Jewish Christianity.

Bibliography.— Besides the general introductions of Bleek, De Wette, S. Davidson, Hilgenfeld, Holtzmann, Salmon, Dods, and Weiss, and the works on the New Testament canon by Kirchofer, Overbeck, Westcott, and Zahn, may be consulted the special commentaries by Bassett (1876), Reuss (1878), Erdmann (1881), Schegg (1883), E. H. Plumptre (1884), Beyschlag (1888; the 5th ed. of the commentary in the 'Exegetisches Handbuch'), and R. Johnstone (2d ed. 1888).

James Island, an island in Charleston harbor, in South Carolina. It is separated from the city of Charleston by the Ashley River and the South Channel of the harbor, here a little over a mile wide. On the northeast coast of the island is Fort Johnson and nearby a quarantine station. Just northeast of the island is Fort Sumter (q.v.). The battle of Secessionville, fought on 16 June 1862, and several other engagements of the Civil War, took place on this island.

James Milliken University, an organization which includes three institutions of learning: the Lincoln College, located at Lincoln, Ill.; the Industrial School and the Decatur College, at Decatur, Ill. The synods of the Cumberland Presbyterian Church of Iowa, Indiana, and Illinois, founded, in 1865, the Lincoln College. Schools of art, music and elocution, a classic college, and a preparatory department, at times a commercial school, all made up Lincoln College. The Decatur College and Industrial School are endowed institutions opened in 1903. In 1900–01 a fund for a university was provided by gifts from James Milliken, an appropriation from the Cumberland Presbyterian synods of Iowa, Illinois, and Indiana, and donations from the citizens of Decatur. The three schools mentioned were united in the James Milliken University, but each one retains to a certain degree its own independence.

James River, a stream which has its rise in Wells County, in North Dakota, and flows south into South Dakota, and in a southerly direction across the State into the Missouri River. Some of the largest cities and towns of the interior of both North and South Dakota are on or near the James River; Aberdeen, Huron, Mitchell, and Yankton near the mouth, in South Dakota; and Jamestown in North Dakota. It is about 450 miles long.

James River, the largest river in Virginia, has its rise in the western part of the State, in

the Alleghany Mountains; the head-waters are the Jackson and Cowpasture rivers which unite at Covington, in Virginia. The James flows southeast to Buchanan, in Botetourt County, then northeast to Balcony Falls, where it breaks through the Blue Ridge Mountains, again southeast to Lynchburg, then northeast to Scottsville, from which point the general course is southeast to the Chesapeake Bay. Its length is about 456 miles. At the Rocketts, just below Richmond, where the river becomes a tidal stream, is the head of navigation for steamboats of 130 tons, about 150 miles from the mouth. Ocean steamers come up the river as far as City Point, at the mouth of the Appomattox River. From City Point to the mouth, 66 miles, the stream is really a broad, deep estuary with Hampton Roads (q.v.) at its entrance to the Chesapeake. The falls in the river at Richmond, about 100 feet in six miles, furnish a large amount of water power. From Richmond to Buchanan, a distance of nearly 200 miles, the Kanawha Canal follows the course of the river and utilizes extensive reaches of slack water navigation. The chief tributaries of the James are the Chickahominy (q.v.) from the north, and the Appomattox from the south. The broad body of water at the entrance into Chesapeake was early explored by European navigators, and Jamestown (q.v.), the first permanent English settlement, was located on this river.

Jameson, jā'mē-sŏn, **Anna Brownell Murphy,** English author and art critic: b. Dublin 17 May 1794; d. Ealing, Middlesex, England, 19 March 1860. In 1827 she was married to Robert Jameson, afterward speaker of the House of Assembly of Upper Canada, and attorney-general, but the union proved unhappy. She made her first appearance as an authoress by the publication of the 'Diary of an Ennuyée' (1826), which was very favorably received. Her 'Loves of the Poets' appeared (1829), and was succeeded by 'Memoirs of Female Sovereigns' and 'Characteristics of Shakespeare's Women.' In 1836 Mrs. Jameson visited her husband in Canada, and published 'Winter Studies and Summer Rambles in Canada' (1838). Later works of hers include: 'Handbook to the Public Picture-galleries of Art' (1842); 'Companion to the Private Galleries of Art in London' (1844); 'Memoirs of the Early Italian Painters' (1845); 'Memoirs and Essays on Art, Literature, and Social Morals' (1846); 'Sacred and Legendary Art' (1848); 'Legends of the Monastic Orders' (1850); 'Legends of the Madonna' (1852). In these the author has given admirable expositions of the works of the old masters and the religious bearings of mediæval art. Few writers have done so much to refine the public taste, and diffuse sound canons of art criticism. Consult: Macpherson, 'Memoirs of the Life of Anna Jameson' (1878).

Jameson, John Franklin, American historical writer: b. Boston 1 April 1859. He was graduated from Amherst College in 1879 and was professor of history at Brown University 1888–1901. He has been managing editor of the 'American Historical Review' from 1895 and the head of the department of history at the University of Chicago from 1901. He has published 'History of Historical Writing in America' (1891); 'Dictionary of United States History' (1894); etc.

Jameson, Leander Starr, Scottish physician, administrator, and freebooter: b. Edinburgh 8 Feb. 1853. He studied medicine in Edinburgh and London, began professional practice at Kimberley, Cape Colony, in 1878, in 1891 became administrator of Rhodesia for the British South Africa Company, and in 1895 led the now well known raid into the Transvaal. During disturbances between the Boers and the Uitlanders, or foreigners, in the South African Republic, Jameson had, by order of Cecil Rhodes (q.v.), then premier at the Cape, assembled a Rhodesian military force on the Transvaal border, to act in case of emergency. On 29 December, with 600 troopers, Jameson, proceeding on his own judgment, entered the South African Republic for the support of the Uitlander party. His force was compelled to surrender to the Boers at Doornkoop on 2 Jan. 1896. Jameson, with his officers, was handed over by President Kruger to the British government for trial. He was sentenced, May 1896, to ten months' imprisonment, but in December was released because of illness. In 1897 he returned to Rhodesia, and in the second Boer war served in the English army. Jameson's surrender was followed by a congratulatory message to Kruger from the German emperor which for a time threatened serious consequences.

Jameson, Patrick Henry, American physician: b. Monroe Township, Jefferson County, Ind., 8 April 1824. At 19 he went to Indianapolis, taught school there four years, studying medicine meanwhile, and was graduated from Jefferson Medical College, Philadelphia, in 1849. He then returned to Indianapolis, where he became very prominent as a physician. During the Civil War he served as military surgeon and was commissioner of the Indiana hospital for the insane, 1861–80. He was likewise active in the establishment of the Indianapolis city hospital and in the organization of the University of Indianapolis, and was for 30 years a director of Butler College, at Indianapolis. From 1863 to 1869 he was a member of the Indianapolis common council and compiled the city ordinances in 1865. He has published 'Memoirs of Prominent Physicians of Indianapolis.'

Jameson Raid, The. See JAMESON, LEANDER STARR.

Jamestown, jāmz'town, N. Y., city in Chautauqua County, on the Conewango Creek, which is the outlet of Chautauqua Lake; and on the Erie and the Jamestown & C. L. R.R.'s; about three miles from Chautauqua Lake, 25 miles from Lake Erie, and 70 miles, by rail, southwest of Buffalo. Lake steamers and trolley cars connect it with a number of the nearby towns. The first permanent settlement was made in 1810, by settlers in search of agricultural lands. The location, so near the outlet of the lake and in the midst of a fertile agricultural region, attracted settlers, and in 1815 the town was planned; and was incorporated as a village in 1827. The country around developed rapidly, but Jamestown was not chartered as a city until 1886. The chief manufactures are furniture, woolen goods, photographic paper, metallic goods, boots and shoes, agricultural implements, and brooms. It has saw-mills, canning factories, lumber and brick yards. The city has the James Prendergast Free Library, containing about 17,000 volumes, and an excellent high school.

The municipal officers are a mayor, who holds office two years, a city council, a clerk, overseer of the poor, sealer of weights and measures, constables, assessors, justices of the peace, and police justices, all of whom are elected by the people. Other subordinate officials are appointed by the mayor subject to the approval of the council. Jamestown was the home of Reuben E. Fenton (q.v.). There are about 8,000 Swedes now living in Jamestown. Although they are adopted citizens, those born in Sweden still use their native language in the homes; and they have their own Swedish papers and literature. Pop. (1890) 16,038; (1900) 22,892.

Jamestown, N. D., city, county-seat of Stutsman County; on the James River, and on the main line and a branch of the Northern Pacific railroad; about 80 miles west of Fargo, on the Red River of the North, and 100 miles east of Bismark on the Missouri River. It is situated in an agricultural region, noted for its extensive wheat fields and large stock farms. Some of the industrial establishments are flour-mills, grain elevators, stock-yards, wholesale groceries, lumber and brick yards. It is the trade centre for a large extent of country, and the small towns off the railroad procure their local supplies of manufactures and groceries from Jamestown. Pop. (1900) 2,853.

Jamestown, Va., in James City County, the first permanent English settlement in the New World, and capital of Virginia 1607–98; on what was a peninsula of the James River some 32 miles from its mouth, nearly opposite the present Williamsburg, with a neck overflowed at high tide, and since then washed away, leaving the place an island; the front also has been eaten away by the river, so that the site of the original huts is submerged. It was ill chosen and malarious, and the place never prospered; but no towns did in early Virginia. It was founded 13 May 1607 by the company of Gosnold, Wingfield, John Smith, etc., with Capt. Newport; and was first a triangular wooden blockhouse called Fort James, after the king, around which some huts sprang up. These were entirely destroyed by fire in 1608, but soon rebuilt. In 1609 there were 50 or 60 wooden houses of one and two stories, with a chapel and a storehouse, surrounded by a log palisade 15 feet high, and with a fort at the neck. During the Starving Time of 1609–10 it was nearly depopulated, and on 7 June 1610 the remnant deserted it and started for England; but meeting Lord Delaware with provision ships at the mouth of the river, all turned back and reoccupied it. Delaware found the chapel "ruined and unfrequented." In 1616 John Rolfe says there were 50 inhabitants. By 1619 a church of hewn timber 50 x 20 had been built; in July 1619 the first legislative assembly in America was held there. A timely warning enabled its inhabitants to escape the great Indian massacre of 1622, and it was a place of refuge for those outside it. The first brick edifice in Jamestown was erected in 1640; a brick church some time after; between 1676 and 1684 was built the brick church whose ivy-mantled tower still stands, and which is incorrectly supposed by many tourists to be the one in which Rolfe married Pocahontas. About the same time a more ambitious fort was begun, with a magazine still traceable; but so injudiciously located for guarding the river-channel that it was above instead of below the place to be defended. Jamestown has little history separate from the colony thence till Bacon's Rebellion (q.v.); as Berkeley's capital, it was burnt to the ground by Bacon, that it might no longer "harbor the rogues." Again rebuilt, in the last decade of the century it was once more destroyed by fire, and never rose from its ashes. It had long been dwindling, and removal of the capital had been mooted, and in 1698 Williamsburg was made the capital. Till very recent years the ruins of Jamestown were left to sink gradually into the encroaching river; but some years ago the Association for the Preservation of Virginia Antiquities bought it, and with the help of the national government have built a sea-wall and saved the relics from further destruction. Besides the church tower, a few tombstones and remains of two or three houses still exist. Consult Tyler, 'Cradle of the Republic' (1900).

Jamestown Weed. See DATURA.

Jamieson, jā'mĭ-sŏn, **Cecila Viets Dakin,** American novelist: b. Yarmouth, N. S., 1848. She was married in 1878 to Samuel Jamieson of New Orleans. She has published 'The Story of an Enthusiast': a novel (1887); 'Lady Jane'; 'Toinette's Philip'; 'Seraph'; 'The Little Violinist'; 'Woven of Many Threads'; 'The Lily of San Miniato'; etc.

Jan Mayen, yän mī'ĕn, an island in the Arctic Ocean, about 250 miles northeast of Iceland; area, about 160 square miles. It is volcanic, with an irregular surface, mountainous near the extinct volcano, Beerenburg, about 6,500 feet in height. One of the active volcanoes is about 1,500 feet high. There are some large glaciers on the island, one near Beerenburg. Vessels from Norway and Scotland occasionally visit the island. In 1882–3 scientists from Austria lived on the island for some months, engaged chiefly in making meteorological observations. The island was named after Jan Mayen, a Dutch navigator, who discovered the land in 1611. Later it was ascertained that Henry Hudson visited the island in 1607.

Janauschek, yä'now-shĕk, **Fanny** (FRANZISKA MAGDALENA ROMANCE), American actress: b. Prague, Bohemia, 20 July 1830; d. Amityville, L. I., 28 Nov. 1904. She first went upon the stage in Cologne, playing in that city and also in Frankfort, 1848–60, and subsequently played in Dresden and the principal cities of Germany. In 1852 she was married to Captain Frederick Pillot, of the Germany navy. She made her first tour in America, 1867–9, playing in the German language and securing most favorable notice. Returning to Germany she studied English, and in 1873 made her second visit to the United States, when she played in English the most exacting Shakespearian roles. She was also very successful in such roles as Meg Merrilies, Mary, Queen of Scots, and in double roles, as in 'Bleak House' and other plays. She retired from the stage in 1898.

Jane Eyre, ār, a famous novel by Charlotte Brontë, published in 1847. In the character of Jane Eyre, the young authoress first found an outlet for the storm and stress of her own

nature. The book is therefore autobiographical in the truest sense.

Jane, Fred. T., English naval author: b. 6 Aug. 1865. He was educated at Exeter School, invented the naval war game, was naval correspondent of the *Engineer*, the *Scientific American*, and the *Daily Chronicle*, and has written: 'Blake of the "Rattlesnake"' (1895); 'The Incubated Girl' (1896); 'To Venus in Five Seconds' (1897); 'The Lordship, the Passen, and We' (1897); 'The Violet Flame' (1897); 'The Port Guard Ship' (1897); 'All the World's Fighting Ships' (naval annual); 'The Torpedo in Peace and War' (1898); 'The Jane Naval War Game' (1898); 'The Imperial Russian Navy' (1900); 'Ever Mohun' (1901); 'Hints on Playing the Jane Naval War Game' (1902); 'The Jane Coast Operations War Game for the Instruction of Garrison Artillery in Coast Defense' (1903); 'The Imperial Japanese Navy' (1904); etc.

Janes, Edmund Storer, American Methodist Episcopal bishop: b. Sheffield, Berkshire County, Mass., 27 April 1807; d. New York 18 Sept. 1876. In 1830 he entered the Methodist ministry in the Philadelphia conference, in 1835 became financial agent for Dickinson College, in 1840–4 was financial secretary of the American Bible Society, and in 1844 was elected bishop. In connection with his episcopal duties he traveled widely in the United States and abroad, and subsequent to the Civil War aided in the reorganization of his Church. He had some reputation as a preacher.

Janes, Lewis George, American scholar and author: b. Providence, R. I., 19 Feb. 1844; d. Greenacre, Maine, 5 Sept. 1901. He was president of the Brooklyn (N. Y.) Ethical Association in 1885–96, lecturer on sociology and civics in the School of Political Science there in 1893–6, and in 1896 became director of the Cambridge (Mass.) conferences and the Monsalvat school of comparative religion. In 1899 he was elected president of the Free Religious Association of America. Among his works are: 'A Study of Primitive Christianity' (1887); 'The Evolution of Morals' (1889); 'Life as a Fine Art' (1891); 'War and Progress' (1893); 'Cosmic Evolution as Related to Ethics' (1895); 'Social Ideas and Social Progress' (1899); and 'Health and a Day' (1901).

Janesville, jānz'vĭl, Wis., city, county-seat of Rock County; on the Rock River and on the Chicago, M. & St. P. and the Chicago, N. W. R.R.'s; about 85 miles northwest of Chicago and 60 miles southwest of Milwaukee. The first permanent settlement as a village was in 1837, and it was chartered in 1853. Janesville is located in an agricultural region, noted for the amount and quantity of tobacco raised. The chief manufactures are agricultural implements, foundry products, wagons and carriages, furniture, cotton and woolen goods, boots and shoes, flour, fountain pens, and school supplies. It has large lumber and brick yards, storage houses, and stock yards. Its principal trade is in its own manufactured goods, farm and dairy products. Some of its principal buildings are the State School for the Blind, the Saint Joseph's Convent, the Y. M. C. A. buildings, two hospitals, the churches, high school, public library, court house, and city hall. The mayor holds office for two years. The mayor, council, board of education, attorney, city clerk, treasurer, sealer of weights and measures, and justices of the peace are chosen by popular election. The mayor appoints, subject to confirmation by the council, the directors of the public library; the council elects the city engineer, the assessors, and the street commissioners. The members of the fire and the police departments are selected from the eligible civil service lists. From 1885 to 1903 there has been a constant and healthy expansion in industrial and commercial lines. Pop. (1890) 10,836; (1900) 13,185.

Janet, zhä-nā', **Paul,** French philosopher: b. Paris 30 April 1823; d. 4 Oct. 1899. He was educated at the Lycée Louis-le-Grand and the École Normale. He was professor of moral philosophy in the college at Bourges 1845–48, and in the University of Strassburg 1848–57; was professor of logic in the Lycée Louis-le-Grand at Paris 1857–64; and from 1867–97 was professor of the history of philosophy at the Sorbonne. In 1864 he was elected a member of the Academy of Moral Sciences; in 1860 was decorated with the cross of the Legion of Honor; and in 1877 was promoted officer. His chief works are: 'La Famille: Leçons de philosophie morale' (1855), awarded a Sorbonne prize; 'Histoire de la Philosophie morale et politiques dans l'Antiquité et dans le Temps modernes' (2 vols. 1858), also crowned by the Academy; 'Le Philosophie du bonheur' (1862, 1873); 'Etudes sur la dialectique dans Platon et Hegel' (1860); 'Le materialisme contemporain en Alemagne' (1864); 'Histoire de la Science politique' (1871); 'Problèmes du XIXe Siècle' (1872); 'Philosophie de la Révolution française' (1875); 'Les Causes finales' (1877); 'Saint-Simon et le Saint-Simonisme' (1878); 'Les Philosophie française contemporaine' (1879); 'Les Maîtres de la pensée moderne' (1883); 'Les origines du socialisme contemporain' (1883); 'Victor Cousin et son œuvre' (1885); 'La philosophie de Lamenais' (1890); 'Fénelon' (1892); 'Principes de métaphysique et de psychologie' (1896); etc. He also published several text-books, contributed numerous articles on the liberty of thought to many of the leading periodicals and translated Spinoza's 'God, Man, and Happiness,' and Leibnitz's 'New Esays on Human Understanding.'

Janin, Jules Gabriel, French critic: b. Saint Étiene, department of the Loire, 24 Dec. 1804; d. Paris 20 June 1874. He was educated at Saint Étienne and at the Collége Louis-le-Grand; studied law and became a private tutor in the Latin quarter of Paris; and then turned to literature, becoming editor, novelist, journalist, and critic. He soon became a contributor to several papers, notably the liberal opposition paper *Le Figaro*, and the government paper *Quotidienne*, and in 1836 became connected as dramatic critic with the *Journal des Débats*, in the columns of which he wrote for nearly 40 years. He possessed a wonderful piquancy of style and an airy grace of sentiment and wit, but as a critic, however, he was utterly inconsistent through lack of any general principles of judgment, and said the first thing that entered his mind, though fortunately his lack of judgment was linked with amiability. He was an indefatigable worker and was in constant demand by the publishers of Paris to review books, write prefaces and do other literary work. Of his

published works, one or two of which are remarkable both in substance and style, the following are noteworthy: 'L'âne Mort et la Femme Guillotinée' (1829), which went through several editions; 'La Confession' (1830); 'Barnave' (1831); 'Contes fantastiques et contes littéraires' (1832; new ed. 4 vols. 1863); 'Contes nouveaux' (1833); 'Le chemin de traverse' (1836); 'Un cœur pour deux Amours' (1837); 'Histoire de France' for the plates of 'La galerie historique de Versailles' (1837–43); 'Voyage en Italie' (1839); 'Les Catacombes' (1839); 'Le voyage d'un homme heureux' (1840); 'La Normandie Historique' (1843); 'La Bretagne historique' (1844); 'La Religieuse de Toulouse' (1850); 'Les Gaietés champêtres' (1851); 'Les petits bonheurs' (1856); 'Les symphonies de l'hiver' (1857), with drawings by Gavarni; 'Historie de la littérature dramatique en France' (6 vols. 1858), a selection of his weekly *feuilletons*, altered and remodelled so as to present a sketch of the history of the French stage and dramatic artists during nearly a quarter of a century; 'Rachel et la tragédie,' a biographical and critical work upon that great tragic artist, with photographic illustrations (1859); 'La poésie et l'éloquence au temps des Césars' (2d ed. 1864); 'Beranger et son temps' (1865); 'Les oiseaux bleus' (1864); 'Circe' (1867); 'L'Interne' (1869); 'Lamartine' (1869); 'Fin d'un Monde et du Neveu de Rameux'; and a translation of 'Horace' into French (6th ed. 1885). His 'Œuvres de Jules Janin' (12 vols. 1875–78), and 'Correspondence' (1877) appeared after his death. He became a member of the French Academy in 1870.

Janitschek, Hubert, Austrian historical art writer: b. Troppau, Silesia, 30 Oct. 1846; d. Leipzig 21 June 1893. He was educated at the university at Gratz 1868–73, from the latter year until 1877 pursued the study of art history in Italy, from 1877–79 was custodian of the Austrian Museum of Art and Industry in Vienna, and was subsequently professor in the universities of Prague (1879), Strassburg (1881), and Leipzig (1891). He was the author of the following biographies in Dohme's 'Kunst und Kunstler'; Andrea del Sarto, Bellini, Paolo Veronese, Tintoretto, etc.; and also wrote 'Die Gesellschaft der Renaissance in Italien und die Kunst' (Stuttgart 1879); 'Zwei Studien zur Geschichte der karolingischen Malerei' (1885); 'Geschichte der deutschen Malerei' in Grote's 'Geschichte der deutschen Kunst' (Berlin 1890); 'Dante's Kunstlehre und Giottos Kunst' (Leipzig 1892); etc. His wife, MARIE (b. Vienna 23 July 1859) became known as a poet and novelist, her principal works being 'Legenden und Geschichten' (Stuttgart 1885); 'Im Kampf um die Zukunft,' an epic poem (1887); 'Gesammelte Gedichte' (2 vols. 1892); 'Aus Alten Zeiten' (1900); the novels 'Aus der Schmeide des Lebens' (1890); 'Lichthungrige Leute' (1891); 'Atlas' (Berlin 1893); 'Gott hat es gewollt' (1895); 'Frauenkraft' (1900); 'Harter Sieg' (1901); etc.

Janiuay, hä-ne-wī, Philippines, a pueblo of the province of Iloilo, Panay, situated 18 miles northwest of the town of Iloilo, near the Jalaur River. It lies in a hilly country and petroleum has been reported in the vicinity. Pop. 28,700.

Janizaries, jăn'ĭ-zā-rĭz (Turkish, *jeni-tcheri*, new soldiers), an infantry force of Turkey, first organized by the Sultan Orkhan about 1330, and in 1362 increased to about 10,000 by Amurath I., who gave them considerable importance by bestowing on them special privileges. The janizaries thus became a class of warriors so deeply imbued with the military spirit that they proved in many instances a means of salvation to the empire. It was their boast that they had never fled in battle, and they were the nerve and sinew of the Ottoman army. The regular troops of janizaries at one time amounted to 60,000 or more, but they were afterward reduced to 25,000. They were kept in barracks in Constantinople and a few other cities. The irregular troops amounted to 300,000 or 400,000, and were scattered among all the cities of the empire, in time of peace performing police duties. The janizaries who constituted the sultan's bodyguard became in time so dangerous and their insurrections so frequent that several unsuccessful attempts were made to reform or disband them. In 1826 they rebelled on account of a proposal to form a new militia, when the sultan, Mahmoud II., having displayed the flag of the Prophet, and being supported by their commander-in-chief, defeated the rebels and burned their barracks, when many of them perished in the flames. A royal proclamation abolished the corps. As many as 15,000 were executed, and fully 20,000 were banished.

Janko (yŏn'kō) **Keyboard,** a keyboard for the pianoforte, invented 1882 by Paul von Janko; introduced in London 1888, in New York in 1890. It consists of six rows or banks of keys arranged like a fan, placed in a semi-circle. Each note has three different keys. The keyboard can be attached to any pianoforte, grand, upright or square.

Jannaris, Anthony, Greek educator: b. Lakkoi, a mountainous village in Kydonia, southwest of Canea, of the island of Crete, 25 Aug. 1852. He was educated at Canea, Athens, and Marburg; was foreign secretary to the Cretan government 1882–84; headmaster of the public gymnasium there 1883–85; head clerk to the British Consulate in Crete 1884–88; and lecturer on Greek literature at Athens University in 1889. He took a prominent part in the Cretan insurrection of 1889–90, and was proscribed by the Sultan; and subsequently went to England, where for six years he studied in the British Museum investigating the history of the Greek language. Upon his return to Crete he was elected a member of the assembly, and during the troubles of 1897 acted as correspondent for the *Times*. From 1896 to 1904 he was lecturer on post-classical and modern Greek at Saint Andrews University. His publications include: 'Kreta's Volkslieder' (1876); 'Neugriechische Grammatik' (1878); 'Adnotationes Criticæ in Longini Peri Hypsous libellum' (1880); 'Deutsch-Neugriechisches Handwörterbuch' (1884); 'Methodos tês Germanikês Glosses' (1887); 'Methodes tês Gallikês Glosses' (1888); 'Germano-Hellenikòn Lexikón' (1888); 'Hellenikòn Lexikón' (1890–92); 'Peri Erotokritou' (1889); 'Echo der Neugriechischen Sprache' (1890); 'Modern Greek Dictionary' (1895); 'Historical Greek Grammar' (1897); 'Saint John's Gospel, as read by the early Christians'; etc.

Janney, Samuel MacPherson, American biographer and historian: b. in Loudoun County,

Va., 11 Jan. 1801; d. there 30 April 1880. He was a preacher in the Hicksite branch of the Society of Friends, traveled extensively, and in 1869 was appointed a superintendent of Indian affairs by President Grant. Among his works are: 'The County Schoolhouse,' a poem (1825); 'Conversations on Religious Subjects' (1835–43); 'The Last of the Lenape, and Other Poems' (1839); 'The Teacher's Gift,' essays (1840); 'An Historical Sketch of the Christian Church during the Middle Ages' (1847); 'Life of William Penn' (1852–56); 'Life of George Fox' (1853); 'History of the Religious Society of Friends, from its Rise to the Year 1828' (4 vols. 1860–67); etc.

Janow, Matthias von, theologian and reformer, considered the Wiclif of the Bohemian Church: date of birth unknown, though he was probably born in Prague; d. there 30 Nov. 1394. Very little concerning his early life is known, except that he was descended from a noble Bohemian family, studied theology at the University of Prague, and later spent about six years t the University of Paris. He then went to Rome, in 1381 was appointed canon of the Cathedral of Saint Vitus in Prague, and confessor to Charles II., and continued in that office until his death. He had no oratorical ability, but through his writings exercised a remarkable influence on the religious thought of his time. His writings were collected in a work entitled 'De Regulæ Veteris et Novi Testamenti' (1392). In this book he denounced the corruption and evil that existed in the church, alleged gross misconduct of bishops and priests, and urged that all human additions to Christianity, both doctrinal and ceremonial, be eliminated, and that the Church return to its original beliefs and doctrines. The pope declared these writings heretical, and 16 years after his death they were publicly burned with those of Wiclif.

Jans, Anneke, än'nā-kė yäns (or ANNETJE), Dutch colonist in America: d. Albany, N. Y., 1663. She came from Holland to New Netherland in 1630 with Roeloff Jansen, her husband, who secured in 1636 a grant of a tract of land containing 62 acres and reaching from the Hudson to the present Broadway and from a point near Desbrosses Street to Warren Street. In 1654, Anneke, upon the death of her second husband, Everardus Bogardus (q.v.), obtained in her name a patent-right to the tract. In 1671 the land was sold by the heirs to the English Governor Lovelace. Three of the heirs, however, did not sign the document. Subsequently the property was confiscated by the English government and deeded to Trinity Church corporation (1705). From 1749 the possession of the property has been the subject of numerous suits by the heirs, based chiefly on the omitted signatures, and all decided for the defendants.

Jansen, yän'sĕn, or jän'sĕn, **Cornelius,** Dutch theologian: b. near Leerdam, Holland, 28 Oct. 1585; d. Ypres, Belgium, 6 May 1638. From his 17th year he applied himself to the study of theology and first came into notice while professor of theology at Louvain (1630), as a teacher of the most rigid Augustinianism, especially in connection with the doctrine of free will and divine mercy. This brought him into conflict with the Jesuits. He was appointed (1636) bishop of Ypres, where he completed his famous work, on which he had labored for 22 years, under the title 'Augustinus, sive Doctrina Sti. Augustini de Humanæ Naturæ Sanitate, Ægritudine, Medicina.' In this he declared philosophy, especially that of the Aristotelians, to be the source of Pelagian error, and in accordance with rigid Augustinianism, maintained the utter corruption of human nature and the extinction of free will, together with predestination. The school of thought he thus founded is now known as Jansenism (q.v.).

Jansen, Olaus, Swedish naturalist: b. Christianstadt 1714; d. Copenhagen, Denmark, 1778. He was educated in Germany; was a professor in the University of Tübingen for several years; was then appointed to a professorship in the University of Copenhagen, of which he was rector in 1761; and was elected a member of the Academy of Sciences in 1762. In 1764 he was sent by the Danish government to study the natural resources of the South American countries, but during his travels he reached as far north as Central America, Louisiana, and Florida. In 1772 he visited Boston. His chief publications are: 'Den Geist in den Naturvidenskaben og naturens almindelige laere' (Copenhagen 1773); 'Neue Reisen durch Brazil und Peru' (1775); Neue Reisen durch Louisiana und Neuva España' (1776); 'Anmarkningar ons Historia Naturalis och climated af Nye England og Nye Spanien' (2 vols. Copenhagen and Stockholm 1778); etc.

Jansenism, jăn'sen-ĭsm, the teaching of the Jansenists, a sect of Christians still existing in the Netherlands and named after Cornelius Jansen, bishop of Ypres. They profess to hold the truth as it was taught by Augustine, bishop of Hippo, and prefer to be called 'Disciples of St. Augustine.' The free grace of God, the free will of man, and predestination, in the Augustinian sense, formed the main articles of their belief. The Jansenists were, however, accused of reviving the teaching of Michael Baius (1513–89) which had been pronounced heretical by Popes Pius V. and Gregory VIII. Baius taught that original justice is an integral part of human nature, and not a free gift of God; that fallen man, being utterly depraved in his nature, is incapable of doing good; that all actions of man in the natural order are sinful, and that divine grace compels men to be and do good, without the concurrence of their will. The book of Jansen was condemned by Urban VIII. in his 'In Eminenti' (1642), but the pope's decree was not generally accepted in Flanders. The Jesuit Molina and the Molinists, his followers, supported views opposed to those of Jansen. Alexander VII. declared that the errors attributed by the Molinists to Jansen, and which the Jansenists said could not be found in 'Augustinus' were held and enunciated by Jansen. The Port Royalists, Arnauld, Nicole and Pascal, wrote famous books defending Jansen against the Jesuits.

In 1679 Arnauld and his followers were constrained to take refuge in the Netherlands. In 1702 the Sorbonne decided that a priest accused of Jansenism could grant absolution. In 1694 Quesnel's 'Moral Reflections' were published and the controversy had been revived. In his bull 'Unigenitus,' Clement XI. condemned the Jansenist passages in Quesnel's work and the author fled to Brussels, and died in Holland 1719. The Jansenists of Utrecht number about

8,000; they profess to be Roman Catholics, are governed by an archbishop, to whom, however, the pope always refuses confirmation and the gift of the palla. They reject the bull 'Unigenitus' and published a protest against the dogmas of the Immaculate Conception, and Papal Infallibility. Consult: Reuchlin, 'History of Port Royal' (1844); Fuzet, 'Les Jansenistes du 17me Siècle' (1877); Jervis, 'History of the Church of France' (1872). See PASCAL, BLAISE; ARNAULD.

Janson, Kristofer Nagel, Norwegian novelist and educator: b. Bergen 5 May 1841. He was educated for the ministry at the University of Christiana, later interested himself in the movement for popular education and established a "Popular High School," first in Sel, a district of Gudbrandsdalen, Norway, and afterward in Gausdal. Subsequently he traveled in Italy, in 1879 lectured in the United States, and from 1882 until 1892 was pastor of a Unitarian church in Minneapolis, where he had settled. He also became editor of a Unitarian paper, *Saamanden* ("The Sower"), published in the Norwegian language at Minneapolis. He returned to Norway in 1893. For several years the Norwegian Storthing granted him a poet's pension. Among his published works, of which his earlier novels are written in the so-called *Landsmaal,* are: 'Fra Bygdom' ('From the Up-Country Districts' 1866); 'Norske Dikt,' poetry (1867); 'Jon Arason' (1867), a drama portraying the fate of the last Roman Catholic bishop of Iceland; 'Marit Skjölte' (1868); 'Han og ho' ('He and She' 1872); 'Torgrim' (1872); 'Sigmund Bresteson' (1872); 'Fraa Dansketidi' ('From the Times of Danish Rule' 1875); 'Den Bergtekne' (The Spell-Bound Fiddler' 1876); 'Vore Bedsteforældre' ('Our Grandparents'); 'Paa begge Sider Havet' ('On Both Sides of the Ocean'); 'Præriens Saga' ('The Tale of the Prairie' (1885); 'Sara' (1891); 'Jesus Sangene,' a collection of religious songs (1893); etc.

Janssen, Johannes, German Roman Catholic historian: b. Xanten, Rhenish Prussia, 10 April 1829; d. Frankfort-on-the-Main 24 Dec. 1891. He was educated at the universities of Louvain, Bonn (1851–53) and Berlin, was professor of history in the Gymnasium at Frankfort-on-the-Main in 1854, became a priest in 1860, and domestic prelate to the Pope in 1880. He is chiefly known by a work in six volumes, published in 1876 and which subsequently went through 14 editions, entitled 'Geschichte des deutschen volkes seit dem Ausgang des Mittelalters' ('History of the German People from the Close of the Middle Ages to the Beginning of the Thirty Years' War 1618'). This work attained instant and great popularity among the German people, yet though its learning and thoroughness were not questioned, it was severely attacked by Baumgarten, Ebrard, Schweizer, and others as being partial and unfair. A French translation of the first two volumes was published in Paris in 1887–88. Janssen's other works include: 'Wibald von Stahlo und Corven' (1854); 'Frankreichs Rheingelüste und deutschfeindliche Politik in frühern Jahrhunderten' (Frankfort 1861; 2d ed. 1883); 'Schiller als Historiker' (Freiburg 1863; 2d ed. 1879); 'Zur Genesis der ersten Teilung Polens' (1865); 'Gustav Adolph in Deutschland' (1865); 'Frankfurts Reichskorrespondenz von 1376–1519' (1875; 4th ed. 1889); 'Friedrich Leopold, Graf zu Stolberg (1876–77; 2d ed. 1882); 'An meine Kritiker' (1882); 'Ein zweites Wort an meine Kritiker' (1883); etc.

Jans'sen, John, American Roman Catholic bishop: b. Keppeln, Rhine Province, 3 March 1835. He pursued theological courses in the seminary of Münster, and in 1858 in the United States, was ordained priest in 1858, was in missionary work at Springfield and Alton, Ill., was vicar-general of Alton diocese in 1870–7 and 1879–86, and in 1888 was consecrated bishop of Belleville, Ill.

Janssen, Peter, German historical painter: b. Düsseldorf, 12 Dec. 1844. His father was J. Theodor J. Janssen (1817–94), a noted engraver, and from him he obtained his early education; in his 16th year he entered the Academy at Düsseldorf and became a pupil of Bendemanns and Sohn. In 1877 he was appointed a professor in the Düsseldorf Academy, in 1895 its director, and in 1885 was elected a member of the Berlin Academy. In 1868 he painted his first great work 'The Denial of Peter,' in the Academy at Philadelphia. In the same year he obtained first prize in a contest for decorating the walls of the Rathaussaal in Krefeld and completed this work in 1873. In the summer of 1872 he completed the colossal wall painting in the Bremen Exchange, 'The Colonization of the Baltic Coast.' In 1874 he decorated the walls of one of the rooms of the National Gallery in Berlin in wax colors, the painting taken from 12 subjects being entitled 'The Myth of Prometheus. During 1880–82 he decorated the walls of the town hall at Erfurt with six large and three small paintings in wax colors entitled 'Momentous Episodes in the History of Erfurt.' These are noted for their brilliant color scheme and dramatic development. Other paintings by him are: 'The Infancy of Bacchus' (1883), exhibited at the International Exhibition in Munich; 'Walther Dodde and the Peasants of Berg before the Battle of Worringen, 1288,' in the Düsseldorf Gallery, a picture that was awarded a gold medal at Berlin in 1893; 'The Battle at Fehrbellin' (1884); 'Nature,' 'Beauty,' 'Human Life,' and 'Imagination' in the Aula of the Academy at Düsseldorf.

Janssen, Pierre Jules Cesar, French astronomer: b. Paris 22 Feb. 1824. He was graduated in 1852 as licentiate in the mathematical sciences, and in 1860 as doctor of physical sciences, the thesis that he wrote upon the latter occasion, 'L'absorption de la chaleur rayonnante obscure dans les milieux de l'œil,' creating widespread discussion. In 1853 he became temporary professor in the Lycée Charlemagne, and from 1865 to 1871 was professor of general physics in the Special School of Architecture. In 1857 he went to Peru to fix the location of the magnetic equator; from 1861 to 1864 was in Italy observing the solar spectrum; and from the latter year until 1867 was in the Azores with Saint Claire Deville. In 1867 he went to Trani and in 1868 to Guntoor, India, to observe the total eclipse of the sun, making special spectroscopic observations on the protuberances. In 1870 he escaped in a balloon from Paris, then in a state of siege, in order that he might witness the Algerian obscuration; in 1874 watched the transit of Venus in Japan; in 1875 went as astronomer

with the English expedition to Siam; and in the latter year was appointed director of the astrophysical observatory at Meudon, near Paris. In 1883 he was in the Caroline Islands. In 1891 he began his ascensions of Mont Blanc, and in 1892–3 founded an observatory there.

Janssens Van Nuyssen, Abraham, Flemish painter: b. Antwerp 1575; d. there 1632. In early youth he showed remarkable aptitude for painting and when 18 years of age became the pupil of Jan Snellinck. In 1601 he was admitted as a master into the guild of Saint Luke of which he was dean 1606–7; he then visited Italy. As a colorist he ranks next to Rubens among the Flemish painters of the 17th century; in correctness of drawing he excelled him, in treatment of the nude and in bold composition he equalled him, but in general freedom of disposition and touch and in faculty of color he fell far short. The most important of his paintings, which include biblical, allegorical, and mythological subjects are 'Madonna with Saints' and 'Entombment' in the Carmelite church at Antwerp; 'Ecce Homo' and 'Descent from the Cross' in the Cathedral of Saint Bavon at Ghent; 'The Resurrection of Lazarus' in the elector palatine's gallery; 'Madonna,' 'Adoration of the Magi,' and 'Scaldis' in the Antwerp Museum; 'Venus and Adonis' and 'Day and Night' in the Vienna Museum; 'Old Age Resting on Faith and Hope' in the Brussels Museum; 'Meleager and Atalanta' and 'Vertumnus and Pomona' in the Berlin Museum; 'Diana and Nymphs Watched by Satyrs' in the Cassel Gallery; etc.

Januarius, jăn-ū-ā′rĭ-ŭs, **Saint:** b. Naples or Benevento, Italy, 21 April 272; d. Pozzuoli, Italy, 19 Sept. 305. He became bishop of Benevento in 303 and at the time of the persecution of the Christians by Diocletian was beheaded. He is the patron saint of Naples. His body lies in the crypt of the cathedral at Naples; and two phials of his blood which a pious matron caught, according to tradition, at his execution, are preserved in a chapel in the south aisle. It is asserted that the blood liquefies on being brought near the head of the saint. A trial is made on three festivals of each year, the chief of which is the anniversary of the martyrdom, and also when public danger and calamity exists or is impending. It is believed that the patron saint is particularly propitious if the blood moves briskly in the phials and appears of a clear red, while the opposite is regarded as presaging some ill to the country.

Jan'uary, the first month of the year, was by the Romans held sacred to Janus, from whom the name was derived. The Roman year originally began with March, and consisted of only ten months. Numa is said to have added January and February to the calendar; but although the Romans as early as 251 B.C. accepted January as the first month of the year, the nations of Europe did not universally adopt it as such till the 18th century. The 25th of March was the beginning of the ancient Jewish year, and that day, instead of 1 January, long held a legal position in Christian countries as the opening of the new year.

Janus, jā'nŭs, an ancient Latin divinity, after whom the first month of the year was named. He was sometimes represented as a porter or keeper with a sceptre in the right hand and a key in the left, seated on a glittering throne; but was most commonly represented on the Roman *as* of the early coinage as having one head with two bearded faces, one looking forward and the other backward, and this latter image was set up under the arch in the Forum. Janus was called "father," his name was first invoked at the beginning of all solemn sacrifices, and he was worshipped as the god of gods, the ruler of the day and year, the sovereign disposer of war and peace and the dispenser of the fortunes of mankind. By some he was regarded as the god of light and heaven — the sun-god, the supreme janitor in heaven and on earth — who opened the gates of heaven to let out the day and closed them again upon the return of evening. Others held that all doors (*janua*) and all passages (*janus*) were under his care. The temple of Janus, standing on the north side of the Forum near the curia, was in reality only two parallel arches facing east and west, connected by side walls and furnished with gates. According to an ordinance of Numa Pompilius these gates were to be opened at the beginning of every war and remain open until peace was established in every country subject to Rome, but during the long space of 700 years the gates were closed only three times.

Janvier, jăn'vĭ-ā, **Catharine Ann,** American painter and author: b. Philadelphia, Pa. She is the wife of T. A. Janvier (q.v.). Her paintings include 'Geoffrey Rudel and the Countess of Tripoli'; 'The Princess Badroulbadour'; 'The Guitar Player'; 'Daniel at Prayer'; 'The Violinist'; etc. She has written 'Keramics for Students' (1880); 'London News' (1904); and has translated (from the Provençal of Félix Gras) 'The Reds of the Midi' (1896); 'The Terror' (1898); and 'The White Terror' (1900).

Janvier, Margaret Thomson, American author, sister of T. A. Janvier: b. New Orleans 1844. Under the pen-name "MARGARET VANDEGRIFT" she has written many juvenile stories and verses, including 'Under the Dog-Star' (1881); 'Clover Beach'; 'Little Helpers'; 'The Absent-Minded Fairy, and Other Verses' (1883); 'The Dead Doll, and other Verses' (1888); 'The Queen's Body-Guard'; 'Doris and Theodora'; 'Rose Raymond's Wards'; 'Ways and Means'; 'Holidays at Home'; 'Little Bell, and Other Stories'; etc.

Janvier, Thomas Allibone, American author: b. Philadelphia, Pa., 16 July 1849. He received a common school education; was an editorial writer for the Philadelphia *Press, Bulletin,* and *Times* in 1870–81; lived in New York during most of the period 1884–94, and then made his residence in France and England. Among his works are 'Color Studies' (1885); 'The Mexican Guide' (1887), 'The Aztec Treasure House' (1890), and 'Stories of Old New Spain' (1891), material for which was largely derived through visits to Mexico and New Mexico; 'The Uncle of An Angel and Other Stories' (1891); 'An Embassy to Provençe' (1893), the chronicle of a European journey; 'In Old New York' (1894), popular historical sketches; 'In the Sargasso Sea' (1898); 'The Passing of Thomas, and Other Stories' (1900); 'In Great Waters' (1901); 'The Christmas Kalends of Provçe' (1902); 'The Dutch Founding of New York' (1903).

JAPAN:

HISTORY AND MODERN DEVELOPMENT.

In introducing this series of articles on Japanese topics to the readers of THE AMERICANA, two or three matters would seem to need a few words, each, of explanation. Several of the topics treated will undoubtedly appear at first somewhat foreign to the legitimate scope of such a form of publication. The main purpose to be served by the entire series, however, is to make this particular nation understood by other nations, in a confidential and intimate, as well as trustworthy manner. Such a purpose cannot be attained merely by representing the national life in an external way; and this is especially true of a nation whose racial characteristics are so complicated and subtly mixed, whose historical development has been, until recently, so hidden and exclusive, and whose recent changes have been so apparently sudden and so startling. It seemed, then, indispensable to have an article that should reveal that spirit of the Bushido to which Japan owes so much, and to which treatment is given under the title, "The Samurai." Similar considerations are emphatic in their application to that "Retrospect and Prospect" which summarizes the views of one, than whom no other man living can better be qualified to speak in a truthful and enlightening way. The same reason led me also to attempt the difficult and delicate task of writing upon the "Mental Characteristics of the Japanese." It can scarcely be expected, however, that the results of this attempt will commend themselves to all who know, or think they know, the people of Japan. But any failures or defects in this article must not be ascribed to the Japanese; for they have afforded its author every possible means of getting familiar with what they are, when intimately and truthfully known.

Attention need scarcely be called to the large proportion of these articles which have been prepared under the highest official supervision and authority. This fact is at once a guaranty of their accuracy and a proof of the patriotism of the authors. These men not only share the wish that Japan should be judged according to truth and reality; they wish, besides, that the real spirit of her past history and present condition, as well as intentions and hopes for the future, should be understood by other nations. For there is no more frequent and sad source of trouble among nations than an accumulation of misunderstandings.

One word more. The editor of this series of articles has no desire to conceal the fact that his work in connection with it has been done *con amore*. If the fact seems to have colored too deeply the one article which he, as the only foreign contributor to the series, has been permitted to prepare, the conclusion is reasonable that the comparatively cool and critical attitude of all the native contributors must, under the circumstances, be considered as enhancing the trustworthiness of their work. "Let another man praise thee," is a maxim not inapplicable to nations as well as to individuals.

GEORGE TRUMBULL LADD.

---

1. **Japan—Topography.** Along the Pacific coast of the Asiatic continent lies the archipelago of Japan, stretching from the southwest to the northeast. It consists of three large arcs, with their convex side turned towards the ocean. The principal arc, which is situated in the middle, consists of four large islands, namely, the main island of Hokkaido (called Yezo by Europeans), Honshu (often erroneously called Nippon), Shikoku and Kyushu. At both ends of the principal arc begin the other two arcs, Chishima (Kurile) and Ryukyu (Luchu), which are long series of small islands. Besides all these, two large islands have been recently added to this country, Taiwan (Formosa) in 1895, and the southern half of Karafuto (Sakhalin), in 1905. On the whole, the archipelago of Japan consists of six larger islands with the addition of many hundreds of smaller islands. The whole chain meridionally measures 29 degrees of latitude, extending between Vele Rete Rocks (21° 45′ N.) and Alaid Island in the Kurile Group (50° 58′ N.), while it longitudinally covers a comparatively narrow zone between Kwasho in the Hoko Group (119° 20′ E.) and Shimushu Island in the Chishima Group (156° 32′ E.). The area of the principal islands forming these arcs are as follows:

	Area (with annexed small isles), sq. m.
Honshu	86,524
Shikoku	7,011
Kyushu	15,543
Sado	334
Oki	130
Awaji	218
Iki	51
Tsushima	266
Ogasawara-jima	27
Ryukyu	932
Taiwan Group	
Taiwan (Formosa)	13,419
Hoko-to (Pescadores)	49
Hokkaido	
Main island or Hokushu (Yezo)	30,058
Chishima (Kurile)	6,137
Karafuto (Sakhalin) (estimated)	12,634
Total (without Karafuto)	160,699
Total (with Karafuto)	173,333

Partially enclosed by the principal central arc lies the Sea of Japan. This mediterranean

sea is a deep depression, whose maximum depth is near the northeast coast of the Korean Peninsula. The northern end of this sea is connected by the narrow passage of Mamiya Strait or the Gulf of Tartary, with the Sea of Okhotsk, a fairly deep depression partially enclosed by the Chishima arc. Passing through Tsushima Strait, another outlet of the Sea of Japan, we come to the China Sea, which is merely shallow water on a great continental shelf, along the edge of which runs the Ryukyu arc. The warm Japan Current or Kuroshiwo washes the southwestern coast of the archipelago, while the cold Chishima Current flows along the northeastern coast. Tsushima Current, a branch of the former, enters the Sea of Japan and affords moisture and warmth to the northwestern coast of Honshu. Liman Current, one of two smaller cold currents along Karafuto, flows southwest near the coast of the Asiatic continent.

Generally speaking, the archipelago is very mountainous and its topographic features are highly complicated. The crustal movements of the earth have generated large mountain systems, which are again separated into several ranges. Some of these ranges are nearly 10,000 feet in height and exhibit landscapes of Alpine character. Moreover, owing to these terrestrial disturbances, we find many volcanic chains, which are arranged mostly along but sometimes across the principal trend of the archipelago. Many of the lofty peaks in this country are the magnificent cones of volcanic origin. Plains could not develop to any great extent in such a land. They are found occasionally along sea-coasts as well as along the banks of large rivers. Comparatively well developed plains are found in delta districts, which are generally fertile and densely populated. Also in mountain districts we meet some basins, sometimes with lakes nestling in their centres. Rivers in Japan are naturally short and are mostly torrents, thus giving everywhere scenic beauty, as well as water-power for industrial purposes. The stony deltas of these torrents are frequently formed at the base of mountains on the coast. The coastal line is generally well developed, more so along the Pacific coast than along the coast of the Sea of Japan. Every island is indented with innumerable bays and inlets, surrounded by rocky bluffs and sandy beaches. Thousands of isles and rocks are scattered near the coast, especially in the famous Seto-uchi or Inland Sea, which stretches between the three large islands, Honshu, Shikoku, and Kyushu, and is connected by very narrow straits with the Pacific Ocean and the Sea of Japan. The highest development of a coastal line may be seen along the shore of Kyushu, which measures 5.0, while Honshu measures 4.6, Shikoku 3.8, Hokushu 2.3, and the lowest, Taiwan 1.8.

Now let us treat the topography of each principal island in detail.

Honshu. The fundamental form of Honshu the main island, is outlined by two great mountain systems, which are called the northern and the southern arc. The two systems meet in the central part of the island forming a syntaxis or «Schaarung» where lies the great volcanic chain of Fuji. The northern arc, which is often called the Sakhalin system, is quite a large system, and consists of several parallel ranges, whose northern extension passes through Hokushu, the main island of Hokkaido, to Karafuto (Sakhalin). These ranges run nearly north and south but their southern portion gradually tends to the southwest. In the northern half of Honshu or Northern Japan, there are three ranges, separated from each other very distinctly by depressions of low plains. The central range begins on the shore of the Gulf of Mutsu. It runs south, forming the backbone of Northern Japan as well as the watershed between the Pacific Ocean and the Sea of Japan. Geologically the range shows the later formations of the Tertiary Period, accompanying a few exposures of Archæan and Palæozoic formation. Moreover, this range is a series of volcanic cones, forming the Nasu volcanic chain. Some of the cones exceed 7,000 feet in altitude. At the northern extremity of the Nasu volcanic chain stands Osore-yama (2,572 feet) on the north coast of the Gulf of Mutsu. The chain runs south through such volcanoes as Yatsukoda-san (5,153 feet), Ganju-san (6,790 feet), a gigantic volcanic cone of North Japan, Koma-ga-take (3,834 feet), Sukawa-dake (5,435 feet), Zao-san (6,442 feet), Adataro-san (4,658 feet), Adzuma-yama (6,294 feet), Bandai-san (6,442 feet), Nasu-san (6,271 feet), and turns to the southwest and then west through Takahara-yama (5,881 feet), Nantai-zan (8,144 feet), the principal peak of the Nikko Group, Hiuchi-dake (7,813 feet), Akanagi-yama (7,511 feet), Nikko Shirané (7,504 feet), Akagi-san (6,209 feet), Haruna-san (4,779 feet), and Asama-yama (8,134 feet). Some of these are still active. The great eruption of Asama-yama in 1783 and the explosion of Bandai-san in 1888 were most remarkable.

The second range, which runs parallel to the central range and along the coast of the Sea of Japan, is of similar geological formation to the first. These ranges are separated from each other by a series of low lands such as the valleys of the sister rivers Omono and Mogami, the basins of Yonezawa, Aidzu and Inawashiro, etc. The range is divided into two parts by the gorge of Mogami. The northern half, which is composed mostly of hills or low tablelands, is generally comprised under the name of Dewa-hill. The southern half is very mountainous and is called the Echigo Mountain Range. Asahi-dake (7,032 feet), and Iidé-san (6,232 feet) are the prominent peaks of the granite mass in this range. The southern prolongation of the range stretches between the Aidzu-basin and Echigo-plain and terminates in Mikuni Range.

A volcanic chain runs parallel to this western range. Commencing at Iwaki-san (5,209 feet), it passes through Moriyoshi-yama (4,769 feet), Chokai-zan (6,964 feet), and Gassan (5,944 feet). Chokai is well known because of its gigantic proportions and therefore this chain takes the name of this volcano. The coastal line of the Sea of Japan is mostly flat and unbroken. Its monotony is disturbed only by the volcanic peninsula of Oga, which encloses the shallow waters of the lagoon Hachiro-gata. The plain of Echigo on the same

coast is one of the largest plains in the country.

The third range running along the Pacific coast east of the central range differs from the other two in several respects. It consists of such older geologic formations as Archæan, Palæozoic and Mesozoic, associated with various kinds of old eruptive rocks. Topographically it forms no continuous chain as does the central range, and it is divided into the two spindle-shaped mountain groups, Kitakami and Abukuma. The Kitakami group on the north is sharply separated from the central range by the tectonic valleys of Mabechi and Kitakami. Its external features show no regularity as a mountain system, which can be observed merely in its inner stratified structure. The network of numerous valleys extending in various directions, which have resulted from erosion, divide the district into an irregular group of mountains and hills. Hayachiné, the highest peak, measures about 6,560 feet. The coast of this region is not so smooth and flat as the coast of the Sea of Japan, but it is in many places very deeply indented with numerous small inlets of the «Rias» type, such as Miyako, Kamaishi, Onagawa, etc., affording vessels protected anchorages. Near Oshika-peninsula on the south, separated from the mainland by a narrow passage of water, is the granitic island of Kinkazan, whose lofty peak is the sailor's landmark. Waveworn Matsushima, a group of a hundred small islands in the Bay of Sendai to the west of Oshika-peninsula, is noted for its beautiful scenery.

Another mountainous region, lying between the Pacific Ocean and the tectonic valley of Abukuma, is commonly called the Abukuma Plateau. This is a broad mountain mass, and consists of an extensive area of gneiss and crystalline schists with a narrow zone of coal bearing strata of Tertiary formation along the coast. The abrasion was much greater here than in the Kitakami Mountainland. The Ancient mountain system with its complex strata is now reduced to an undulating plateau, whose greatest elevation scarcely exceeds 3,300 feet. The southern extension of this plateau forms the small ranges of Yamizo and Naka, which gradually sink into the plain of Kwanto. At the extremity of the latter stands an isolated mountain called Tsukuba-san (2,850 feet); on one of its summits the well known meteorological observatory was established some years ago by H. I. H. Prince Yamashina. Another extension of the northern arc toward the southwest forms the mountain blocks or «Scholle» of Ashio and Kwanto or Chichibu, which form the north and northwest boundaries of Kwanto-plain. The Kwanto group is a square mass of the older geological formations. On the west it terminates abruptly in the tectonic valley of Chikuma-gawa and in the basin of Kofu, and on the east in the plain of Kwanto. Some celebrated mountains of this group are Buko-zan (4,297 feet), Kobushi-daké (8,062 feet), and Kimpu-zan (8,367 feet). The great volcanic district of Kenashi and Iwasuge with the extinct volcanoes of the same names lies between the Kwanto group on the south and the Mikuni group on the east. The volcanic chain also stretches to the south until it joins the Nasu volcanic chain at Asama-yama. Kusatsu-Shirané (7,498 feet) and Adzumaya-san (7,731 feet) are well known in this chain.

The plain of Kwanto, the largest in the country, stretches between the Kwanto group and the Pacific Ocean. On the south it extends as far as the two hilly peninsulas, Boso (Awa-Kadzusa) and Miura, which enclose the bay of Tokyo, an outshoot of the Pacific. The plain is gently undulating, partly of Tertiary formation, but mostly covered by later deposits. It is drained by many streams, of which Toné is most noted. Lakes and lagoons are numerous, and Kasumi-ga-ura near the mouth of the Toné is the second greatest lake of Japan. The plain is well cultivated and thickly populated. There are 30 cities and towns with populations of over 10,000. Tokyo, the capital of Japan, is situated on the mouth of the Sumida River, which flows into the Bay of Tokyo. At a distance of only 19 miles from the capital is Yokohama, the greatest seaport in the country, and a little south is Yokosuka, one of Japan's naval ports. Many towns in the northern part of the plain are noted for their flourishing silk industry.

In the central part of Honshu, where the two great mountain systems meet, lies a zone of great tectonic depression, which is represented by the valley of Chikuma-gawa on the east, and those of Fuji-kawa and Kamanashi-gawa and the lowlands of Matsumoto-daira on the west. Along this zone runs the volcanic chain of Fuji and many cones stand as the boundary posts separating the two topographical districts, Northern and Southern Japan. The chain originates in the far south in the Marianna Group in the Pacific Ocean; and running north through the Volcano Group (Iwo-jima) and Shichito Group, it reaches the peninsula of Idzu on the south coast of Honshu. Several eruptions on these volcanic islands and of the submarine volcanoes have been recorded in recent years. Noteworthy among these is Oshima or Vries Island, which is now active. The Idzu Peninsula with Amagi-san (4,546 feet) is linked with Honshu by the Hakoné, which is well known for its large and beautiful atrio-lake, Ashi-no-ko, as well as many hot springs. Next to Hakoné and over Ashitaka stands the prominent cone of Mt. Fuji, whose snowclad peak reaches the height of 12,392 feet. The chain tends towards northwest and north and passing through Kaya-ga-take (4,067 feet), Yatsu-ga-take (9,637 feet), Tateshina-yama (8,298 feet), it terminates at the Myoko Group (Myoko-zan, 8,049 feet) on the coast of the Sea of Japan.

The southern arc of Honshu was first described as a part of the Sinian System by Pampelly and then as a part of the Kuenlun System by Loczy, both considering it as a single system and an extension of Nan-ling or of Peling (Tsin-ling) on the Asiatic continent respectively. But Baron von Richthofen in a recent opinion says that it consists of two different mountain systems, which unite in southern Japan; one chain on the coast of the Sea of Japan, which he names Chugoku Mountain, being probably an extension of the Kuenlun System or Tsin-ling, while the other, which runs along the Pacific coast and is called the

Kuma-kii Range, belongs to the mountain system of Southern China or Nanling. Without going into further discussions of these tectonic problems, we will turn our attention to the general topography of Southern Japan.

Between the tectonic valleys of Fuji-kawa and Tenryu-gawa lies the Akaishi mountain, which from its outline is often called Akaishi Sphenoid. It is composed of several ranges of various geological formations. The highest peak of the Akaishi proper reaches the altitude of 10,145 feet, while the culminating peak of the whole group with a height of 10,332 feet is in the Shiramine Range, which runs parallel to the Akaishi proper on the eastern side of the Oigawa valley. The northern extension of the Shiramine joins a granitic mass with the precipitous peaks of Koma-ga-take (9,843 feet) and Ho-o-zan (9,551 feet). The southern extension of the Akaishi Range forms the mountain districts of Totomi and Mikawa, and disappears in the Akumi Peninsula.

Nearly parallel to the Akaishi mountain, and between the two great valleys of Tenryu and Kiso, extends the Kiso Range with another Koma-ga-take (9,446 feet). This range joins the mountainlands of Mikawa in the south. The spurs of these mountains form a terraced coastal plain which is mostly grass-plain or «Hara,» such as Takashi-ga-hara, Mikata-ga-hara, etc. The lowlands at their base are well cultivated and contain many towns and villages, through which runs the trunk line of the Tokyo-Kobé railway. Many large rivers such as the Fuji, the Abé, the Oi and the Tenryu flow towards the south, cutting deep valleys in the Akaishi mountain and its spurs, and forming stony deltas on this coastal plain. On the plain is Lake Hamana, which is now connected with the sea by a narrow outlet.

Coming back to the great tectonic valley of Fuji-Kamanashi, we find the small basin of Suwa with the lake of the same name. It lies 2,600 feet above sea level and is the source of the Tenryu. Further to the north, separated from this basin by the small ridge of Shiojiri-togé, stretches the valley of Matsumoto-daira with an average height of 1,500 feet. Rising precipitously from this level the lofty Hida Range forms the western boundary of the valley. This range extends south to the right side of the great Kiso valley, and the north end of it terminates abruptly in the precipitous cliff of Oyashirazu on the Sea of Japan. This is the highest mountain range in the Empire with many peaks of 10,000 feet in altitude, and hence it is often called the «Japanese Alps.» There is no glacier in this range at present, but the striated surface of the rocks of Shirouma-ga-take, one of the prominent peaks, indicates the former existence of one. Like the Akaishi Range, it consists of older geological formations and various eruptive rocks. Among several peaks Yari-ga-také (10,142 feet) or the «Matterhorn of Japan», Hodaka-yama (10,168 feet), Jonenbo-daké (10,168 feet), Otenjo-daké (10,447 feet), Shirouma-ga-také (9,624 feet) are the most celebrated. The size and importance of this range is still further increased by its junction with the Norikura Volcanic Chain. The two largest volcanoes of this chain, Ontake (10,447 feet), and Norikura-ga-daké (10,385 feet), are next in height to Mount Fuji. Tateyama is a lofty group including Tateyama proper (9,630 feet) and Ken-ga-mine (about 9,840 feet) closely parallel to the western side of the northern Hida Range and separated from it by the great gorge of Kurobe-kawa.

The western flank of the whole Hida Range is not so steep as the eastern, but slopes to the mountainland of Hida, sometimes called the Hida Plateau. This comprises a wide tract of the most mountainous district in Japan, which spreads over the province of Hida and a part of Mino and Etchu. In its centre there is the small basin or «Becken» of Takayama. To the north of this mountainland lies the fertile plain of Toyama, along the coast of the deep Toyama Bay, an arm of the Sea of Japan. Jindzu-gawa and Imidzu-gawa drain this mountainland and then flow through the plain. The western border is a high ridge, upon which stands the volcano Haku-san (8,659 feet). The range slopes gradually through a hilly region to a narrow belt of the coastal plain along the Sea of Japan. The province of Noto is a large peninsula on this coast, with Nanao, an excellent harbor. The coastal plain is thickly populated and there are such towns as Kanazawa, the seat of an old «Daimyo,» and as Fukui, famous for its silk manufacture.

On the south of the Hida Mountainland stretches the low lands of Mino and Owari. It is a part of the great depression, whose southern half is now occupied by the Isé-no-umi, an arm of the Pacific. The Mino-Owari plain is drained by the three rivers, Kiso-gawa, Nagara-kawa, and Ibi-kawa. It is extremely fertile and produces rice of an excellent quality. Nagoya is a flourishing commercial and industrial city and also an important railway junction in this plain. This plain is bounded on the west by the range of Ibuki, Yoro, and Suzuka. On the further west, there is a series of such depressions separated from each other by north and south «Horst» ranges, which finally come to the great depression of the Inland Sea or Setouchi.

Next to the Mino-Owari plain and between the «Horst» Yoro and Hiei-Kasagi, there lies the depression of the Province of Omi, the greatest part of which is occupied by Lake Biwa, the most picturesque and largest fresh-water lake in Japan. The waters of the Sea of Japan cut deep into the land, forming Tsuruga Bay, and there is only a narrow tract of land between this bay and Lake Biwa. Iga is a small basin to the south of the former. On the southwest of Omi Basin there are the basins of Yamashiro and Yamato. There was, however, originally a single depression between Hiei-Kasagi (Hira-san 4,044 feet, Hiei-zan, 2,700 feet), and Kongo (4,057 feet) mountains, which was afterwards divided into the two basins by the undulating hills of insignificant height between them. These basins have played an important rôle in the history of Japan. The basin of Yamato was the seat of the capital of the Nara dynasty, 1,000 years ago, and there still remain many buildings, especially ancient Buddhist temples. In the centre of the basin of Yamashiro is situated the city of Kyoto, which was the capital of

Japan for a thousand years until Tokyo was made the new metropolis in 1868. The city, which is often called the «Paris of Japan,» is well known for its scenic beauties and its many old magnificent palaces and temples, and it is also noted for its artistic and industrial wares, especially various kinds of silk, embroideries, porcelains and cloisonné ware.

On the other side of Kongo-horst lies the plain of Settsu, which sinks into Osaka Bay on the west. The Yodo River drains Lake Biwa, and passing through both the plains of Yamashiro and Settsu, it discharges into Osaka Bay. Lying at its mouth, Osaka was for centuries a commercial centre of Japan and at present it is a flourishing industrial city. It is the second largest city of Japan with its population of over 1,000,000. Kobé has an excellent harbor on the shore of the bay and is the largest tea exporting port in the Empire.

On the south of this framework of «Horsts» and depressions lies the large peninsula of Kii. It is bounded by the Idzumi Range, whose highest point is Katsuragi-san (2,814 feet). Ki-no-kawa flows in the valley at the southern foot of this range. The peninsula is very mountainous. Especially on the eastern side of Kumano-gawa, a deep transversal valley, the range attains a considerable height in many peaks of the Omine Group (culminating point is 6,153 feet) and Odaiga-hara-san (5,527 feet). These mountains are nothing but an extension of the noted Akaishi Range. The range dips down into the Sea of Ise at the peninsula of Akumi; but, reappearing in Shima Peninsula on the opposite coast of the sea, it extends westward with an increasing magnitude and height. Several geological formations from an old crystalline schist to the Tertiary, are exposed in the successive zones from north to south. The continuity of this system may be well traced in the Island of Shikoku through Kii strait.

On the other hand, the palæozoic mountainlands of Tamba lie north of the Yamashiro and Settsu basins. They occupy an extensive area of older formation, like the Hida Plateau, but not so high and inaccessible. On the north of these mountainlands is the wide bay of Wakasa, its coast indented with many small inlets. On this bay are Maidzura, a naval port and also Amano-hashidaté, noted for its beautiful scenery.

The western part of Honshu forms the large peninsula of Chugoku. It is almost entirely mountainous with a few plains along the coast and rivers. The mountains, however, scarcely exceed 4,000 feet in height, with the few exceptions of some volcanoes, which form a volcanic chain through the northern half of this district. Dai-sen (6,157 feet), Sambe-yama (4,025 feet) and Aono-yama are the most celebrated volcanoes. The earlier geological formation of Chugoku is greatly disturbed by the eruption of granite and other igneous rocks, which are now widely exposed throughout this district. Rivers are generally short, and there are only a few noteworthy ones such as Go-no-kawa running into the Sea of Japan, Higashi-no-Okawa, Nishi-no-Okawa, Kawabe-Kawa, and Ota-gawa flowing into the Inland Sea or Setouchi. The coastal lines on both sides of this district show great contrasts. Along the Sea of Japan the coast is very poor with bays and islands. There is one independent range, the Shinji, forming a peninsula of Shimane, which is separated from the main land by the Lagoon Naka-no-umi. Lake Shinji and the low plain of Kidzuki. The south coast of Chugoku is quite different. It faces Setouchi on the Inland Sea. This peculiar sea is a zone of depression having Chugoku on one side and Shikoku and Kyushu on the other. It is divided into several «Nada» or seas by groups of thousands of islands which now remain as detached elevations in this depressed zone. On the east, Awaji, the «Horst»-island separates the Osaka Bay from Harima-nada. Midzuchima-nada, Bingo-nada, Aki-nada and Suo-nada lie to the west. They are generally very shallow and in most parts do not exceed twenty fathoms in depth. The only portions where great depths are found are the narrow passages at the outlets of the sea, where the bottom is acted upon most effectively by the erosion of tidal currents.

The coastal line of Chugoku is highly developed on the shore of Setouchi. Numerous inlets cut into the land, and there are many good harbors and anchorages. Among them the Bay of Hiroshima is one of the best, with the city of the same name on its shore, and Ujina, its roadstead, which was the headquarters of transport ships in the recent wars. Not far from Ujina, and on the coast of an arm of Aki-nada, is the naval port of Kuré with its large docks and arsenal. Itsuku-shima, situated in Hiroshima Bay, is noted for its beautiful scenery.

Shikoku.—As a whole this great island is a single mountain group of Southern Japan. It is separated from Chugoku by the Inland Sea, while a great depression forms the large bay of Tosa on the south, bounded by the two promontories, Muroto and Sada (Ashizuri), projecting southwards into the Pacific. Kii Strait on the east and Bungo channel on the west, cut off Shikoku from Kii Peninsula and Kyushu Island. There is a great similarity between the mountain formations of Shikoku and the others. Shikoku Range, which extends east and west through the island, is a continuation of the mountains in Kii Peninsula and Kyushu Islands. The greater part of the island is very mountainous, and there are several lofty peaks, such as Tsurugi-san (7,354 feet) and Ishidzuchi-san (6,878 feet). The northern part of Shikoku, from which the two great peninsulas of Takanawa and Sanuki project into the Inland Sea, is very similar in its geological and topographical features to the Chugoku and Setouchi Islands. The peninsula of Sanuki is nothing but a recently elevated tract of the same sea. Many isolated granite mountains and hills, like islands, stand on the low plain. Among many rivers, Yoshino-gawa is most noted. In its upper course it flows eastward, forming a valley in the Shikoku Range, then cutting through the range it forms the famous gorge of Oboké and Koboké and turns again eastwards parallel to the range, flowing through a wide plain until it empties into Kii Channel. Other noted mountain rivers are Shimanto-gawa, Niyodo-gawa and Monobe-kawa, which flow into the

Bay of Tosa. A peculiar development of the coastal line on the western side of the island shows many elongated peninsulas and promontories, such as Sada-no-misaki. Awa-no-naruto, situated in the narrow strait between Shikoku and Awaji is very remarkable on account of its terrible whirlpools, which are caused by tidal currents.

Kyushu.—This is the third largest island in Japan with its topographical and geological features very complicated in many respects. The coastal line, especially in its northern part, is more highly developed than any in the country. The Kyushu Range, which is a continuation of the Shikoku Range, passes obliquely through the southern half of the island. It culminates on the boundary between the two provinces of Higo and Hiuga with several high peaks, such as Ichibusa-yama (5,970 feet), Ishido-yama (5,724 feet) and Mikuni-yama (5,396 feet). Hitoyoshi-Basin is an enclosed basin in this range. The well known river of Kuma-gawa flows from Ichibusa-yama, and passing through that basin cuts this range again forming a picturesque gorge through which it flows into the Sea of Yatsushiro. Further south, there stretch the two great peninsulas of Satsuma and Osumi, forming the shores of the beautiful Bay of Kagoshima. The geological formation of these peninsulas is mostly mesozoic combined with the other deposits by Kyushu Range; but its surface is covered to a great extent by ejecta of volcanoes, there having been several violent eruptions in recent ages. Kirishima-yama is situated between Satsuma and Osumi, and is one of the most celebrated active volcanoes in Japan. Karakuni-daké (5,661 feet) and Takachiho-no-miné (5,064 feet) are magnificent cones in the Kirishima Group. The volcanic chain of Kirishima commences in this group, and runs south through Sakura-jima, the volcanic island (3,749 feet) in the Bay of Kagoshima, and Kaimon-daké (3,041 feet), a perfect cone at the extremity of Satsuma Peninsula. The further extension of this chain passes through the volcanic islands of Kawabé Shichito (Seven Islands of Kawabé), some of which are active at present.

In the northern part of Kyushu, on the other hand, there lies the so-called Tsukushi Mountain, which is a mountain group of various geologic formations, ancient and recent, as well as of plutonic and volcanic rocks. There is no regularity in the mountain formation and the whole region is divided into many mountains and hilly tracts, the heights rarely exceeding 3,300 feet, except in the case of some volcanic cones. An extreme development of the coastal line forms the peninsulas of Sonoki and Shimabara, which are connected with the main body by the narrow isthmus of Isahaya. Omura Bay and Ariaké Bay are separated by these peninsulas from the sea. There are many excellent harbors on this coast. Nagasaki, a beautiful inlet of «Rias» type, was first opened for Dutch merchants, and centuries ago it was known as the only port for foreign trade. Now it has a large dockyard and is a commercial centre of Southern Japan. Sasebo is a good naval port. Many good anchorages are also found on the northern coast. Fukuoka, with Hakata harbor in its neighborhood, is one of the largest towns of Kyushu, situated on the beautiful bay of Hakata. Moji, situated in the extreme north of Kyushu and along the Strait of Shimonoseki, has had a rapid development during the past few years, as an export harbor for coal, which is abundantly produced in the Tertiary hills of the Tsukushi Range in the provinces of Chikuzen and Buzen. Wakamatsu, southwest of Moji, is also a coal harbor, and near this town are the Imperial Iron Works of Yawata.

Between Tsukushi Range and Kyushu Range there lies a great volcanic mass, whose ejecta cover an extensive area in the central part of Kyushu. Aso-san in this group is a remarkable active volcano. The diameter of its outermost craterwall is 17.5 miles by 12.5 miles; perhaps it is one of the greatest in the world. Surrounded by this wall is a large crater plain and in its centre stand five volcanic cones, among which Taka-daké is the highest (5,543 feet). To the northeast of the Aso proper stretches the Aso Volcanic Chain. In this chain there are the volcanic groups of Kuju-san (6,100 feet) next to that of Aso, Yubu-daké (5,517 feet), and Tsurumi-daké (4,890 feet) near the shore of Beppu Bay, and the circular peninsula of Kunisaki with the volcano Futago (2,430 feet). The further extension of this chain may be traced to some small islands in the Inland Sea. Another continuation of this chain in the opposite direction is indicated by Kibo-zan (2,326 feet) in Kumamoto Plain and Unzen-ga-také (4,871 feet), on Shimabara Peninsula. To the north of the latter there is another volcano Tara-daké (1,226 m).

A comparatively wide plain extends along the shore of Ariaké Bay. It is divided into two parts by the hilly region of Miiké. The northern plain is drained by Chikugo-gawa, the largest river of Kyushu, and is thickly populated. Higo Plain on the south has in its centre the city of Kumamoto. This plain is extremely fertile and produces rice of the best quality. There are many islands near Kyushu. On the west there are the twin islands of Amakusa, Koshiki and Goto Group, while on the north Iki and Tsushima form the stepping stones between Japan and Korea.

Ryukyu.—All the islands stretching between Kyushu and Taiwan (Formosa) are comprised under the name of Ryukyu Group. But politically the northern group of these islands belongs to Kyushu. These islands are nothing but the peaks of a submerged mountain ridge along the edge of the continental shelf. Geologically the arc of Ryukyu is divided into three zones. The islands in the central zone are mostly of older geologic formations, while those in the outer zone are of the later Tertiary period. The inner zone is of the volcanic origin, and is the continuation of the Kirishima volcanic chain of Kyushu. Okinawa-jima, the largest island, is situated in the centre of this group. Most of the islands are hilly, with the exception of Yaku-shima with a granite mountain Yaku-daké (6,183 feet).

Taiwan (Formosa).—This spindle-shaped island is at the southern extremity of the Empire and lies next to the Province of Fokien of Southern China from which it is separated by the Taiwan Channel. The slight develop-

ment of the coastal line characterizes this island, there being no large indentations. Kelung, the gate to this island on its northern end is but a small «Rias» harbor. The backbone of Taiwan begins with a precipitous cliff on the northern coast, and stretches W. S. W. for some distance, then turns to S. S. W. at Setsusan (Mount Sylvia, 12,641 feet). From this lofty peak the range runs along the length of the island, until it terminates at Garampi or the South Cape. It culminates at Niitakayama or Mount Morrison (14,268 feet), the highest mountain of Japan. This range consists of Palæozoic and Archæan formations and slopes abruptly on its eastern side. Sharply separated from this range by a tectonic valley, another small range (the Taito), stretches north and south along the eastern coast. Parallel to the west side of the central range lie spurs of a later geological formation with a lower altitude. Along its foot extends a strip of the coastal plain, where the soil is remarkably fertile, and sugarcane and rice are cultivated. A characteristic feature of this plain is the excellent development of the deltas of many rivers, which, leaving the mountain region, suddenly discharge their water and silts into the plain. Taihoku, the metropolis of the island, is situated in a small basin at the northern end, through which the Tamsui River flows, having Tamsui harbor at its mouth. The hilly tract around this basin is well known for its tea plantations. On the north of the same basin stands the volcanic group of Taitonzan (2,145 feet).

Hoko-to, or Pascadore Islands, are a group of small islands in Taiwan Channel. They are of basalt, with an insignificant altitude above the sea. The main island of Hoko-to has Mako, an excellent shelter harbor.

Hokkaido.—Hokushu, the main island of Hokkaido, or Yezo, as it is called by Europeans, is the second great island of Japan. It is rhombic in its general outline with the coast mostly level and low, and with a peninsula of fish-tail shape on the southwest. The continuation of the volcanic chains in Northern Honshu extends into this peninsular part. The large bay of Uchiura, or the Volcano Bay, commands an excellent view of various volcanoes on its coast. On the south of the bay is Koma-ga-také, to the southeast of which stands the active volcano of Esan. There are many volcanoes, especially in the region to the north of the bay. Makkari-nupuri or Shiribeshi-yama (6,873 feet), which is situated at the centre of that volcanic region, is noted for its perfect cone. Other volcanoes are Usu, Tarumaye, etc.

The backbone of the main part of Hokushu consists of older rocks and passes through the island in a S. S. E.—N. N. W. direction from Cape Erimo to Cape Soya. The southern half of this range is called Hidaka Mountain, the Yubari Range running parallel to it along its western side. At the centre of this backbone stand many peaks, most of which are of volcanic origin. Among these prominent peaks, Nutapkaushibé (7,691 feet), Oputateshiké (6,494 feet), and Tokachi-daké (5,943 feet) are well known volcanoes, and Ishikari-daké (6,675 feet) consisting of older eruptive rocks, is also noted for its high altitude. The Chishima volcanic chain runs east, from Nutapkaushibé, including several volcanic cones, such as Meakan (5,304 feet), Oakan (4,950 feet), Atosa-nupuri, and Raushi-yama (5,160 feet).

Seaward from these elevations stretches a gently undulating hilly region through which many large rivers flow, such as Ishikari-gawa, Teshio-gawa, Tokachi-gawa, etc. Fertile plains are found along these rivers. The largest plain in the island is that of Ishikari, which separates the main body of the island from its peninsular part and penetrates further northward into the mountain district along the river Ishikari. Kamikawa is a basin at the upper course of that river. Sapporo, the political centre of this island, is situated in the plain of Ishikari, and Otaru, its flourishing harbor, lies at a short distance from it.

Chishima or Kuriles.—This group of islands stretches from the Bay of Nemuro to the southern extremity of Kamchatska Peninsula, describing a large arc forming the eastern boundary of the Sea of Okhotsk. These islands are entirely of volcanic origin, accompanying Tertiary strata in some islands. The three great islands, Kunashiri, Etorofu, and Uruppu, lie to the northeast of the main island of Hokkaido in the order named. These islands have been explored but little and are very sparsely populated.

Karafuto (Sakhalin).—The island of Karafuto stretches from east to west with the meridian of 142° 30′ E. as its axis. This island is now politically divided into two parts by the parallel of 50° N., Japan possessing its southern half. There are two peninsulas at the southern end of Japanese Karafuto which form the coast of Aniwa Bay. Kushunkotan (Korsakof), the political centre of the island, is a harbor situated at the northern end of this bay. Another large bay, which is called Terpenia Bay, lies on the eastern coast. The principal mountain chain, the Sakhalin Range, commences at Cape Notoro at the southern extremity of the island, forming a continuation of the backbone of Hokkaido, from which Karafuto is separated by the narrow channel of Soya. This range is of the later geological periods, like to the northern Hokkaido, and generally it consists of gently undulating hills. There are neither precipitous mountains nor abruptly elevated lofty peaks. The highest mountain, Spamberg, does not exceed 3,300 feet in height. Susuya and Tako Rivers flow in opposite directions along the eastern foot of the range, forming a valley which extends north and south. On the other side of this valley the Susuya Range stretches along the eastern peninsula. There older geological formations are exposed, which may be the continuation of the same strata in Hidaka Range of Hokkaido. Along Susuya River there is an alluvial plain where Vladimirovka, the principal town, is situated. In the middle part of the Island, a similar topography is found. A large river valley formed by the Poronai and the Tym, separates the Tiora Mountain Range on the east from the Sakhalin Range. Poronai River rises in the Russian territory and flows across the boundary line. There is a plain

along the most of its course until it flows into Terpenia Bay. Some tundra or barren lands are found on its upper course.

Climate.—As the archipelago of Japan extends over 29 degrees of latitude, different parts of the country have different climates, though there prevails an oceanic climate in general. In Taiwan and Ryukyu tropical and subtropical vegetations flourish, while in Karafuto and Chishima severe arctic cold is experienced. The mean annual temperature is 75° F. (24° C.) in Koshun, a town in the southern extremity of Taiwan, and is over 68° F. (20° C.) in all islands of Ryukyu Group. In the greater part of Kyushu and Shikoku the mean temperature is 59° F. (15° C.). The Setouchi coast of Chugoku is warmer than the coast of the Sea of Japan in the same peninsula. In the mountainlands of central Honshu, as well as in the provinces of Northern Honshu, the temperature becomes gradually lower and averages 50° F. (10° C.), while a milder climate is always experienced on the Pacific coast. In Tokyo, it is 56.8° F. (13.8° C.) and in Yokohama 57.9° F. (14.4° C.). In Hokkaido the climate is generally cold. In most towns, except those in the southern peninsula, the annual temperature ranges between 39° F. (4° C.) and 44° F. (7° C.). Karafuto and Chishima are of course still colder,though there are no systematic records. August is the hottest month in most of the country, with the exception of Taiwan and southern Ryukyu, where the temperature in the month of July reaches 80° F. (27° C.). February is the coldest month in Taiwan, Ryukyu and some parts of Southern Japan, as well as on the coast of the Sea of Japan, while in other parts January is generally colder. The mean maximum temperature exceeds 86° F. (30° C.) in most of Japan, and the minimum reaches 22° below zero F. (—30° C.) in Kamikawa and Tokachi in Hokkaido.

Having the Asiatic continent on one side and the Pacific Ocean on the other, the most of the archipelago is included in the monsoon region. In winter, when the continent is extremely cold and the highest atmospheric pressure is attained, severe northwest and north winds prevail throughout the country. In summer, however, when the continent is heated and there is a low atmospheric pressure, warm and wet winds blow from the S. and S. W., that is, from the Pacific Ocean. Naturally there are several kinds of local winds, due to the complicated configuration of the land. Violent hurricanes or so-called typhoons (Taifoons), which occur mostly during the last of the summer and in the first of the autumn, cause terrible damage, especially to rice crops. They arise generally in the neighboring sea of Taiwan, and passing over Ryukyu and Kyushu, strike the Sea of Japan. Sometimes they pass further to the east through central Honshu. Typhoons from another source are said to come from the southern sea and suddenly strike the Pacific coast of central Japan.

The rainfall is of course abundant in the islands of Japan. The southern islands experience an extraordinarily great amount of rain. At Kelung in Taiwan, the annual precipitation is 139.2 in., and in Oshima of Ryukyu Group 128.9 in. As a high mountain range runs along the axis of the main islands, a greater rainfall is caused on the coast of the Pacific Ocean during the summer than in the winter, while in the regions along the Sea of Japan the reverse is true. In these regions, except Hokkaido and Northern Honshu, the rainfall exceeds 78 in. annually. In Tokyo it it 58.4 in. The least rainfall occurs in Hokkaido, though there it is not less than 27 in., and in most of the island it amounts to 40 in. or over. In the beginning of the summer, when the summer monsoon commences, the southern and central regions of Japan are generally cloudy and have many rainy days, though the whole amount of the precipitation is not exceedingly great. Heavy rains fall, oftener in storms, at the end of the summer in the same districts, and they cause inundations of many rivers, inflicting great damage on ricefields and hindering communication in several directions.

It is an astonishing fact that an enormous amount of snow falls on the northern coast of Central Japan. Prevailing cold winds from the northwest bring the moisture of the Sea of Japan, especially that of the Tsushima current, a branch of the warm Kuroshiwo or Japan current, and deposit it in the form of snow on the barrier of the high mountain range. It is difficult to believe that the depth of snow on the plains is at least three feet and in the mountain districts is sometimes more than 10 feet during the winter season. This is a real fact, however; whole towns and villages are often nearly buried under the snow, which is cleared away only with great difficulty.

Mineral Wealth.—The chief mineral products of Japan are coal, copper, gold, silver, iron, antimony, petroleum and sulphur. Among these minerals, coal stands as the most valuable product. 10,000,000 tons of coal are annually produced, one-quarter of which is exported. The richest coal-fields are located in the northern mountains of Kyushu and in the Yubari Range of Hokkaido. Coal occurs also on the Pacific coast of Abukuma Plateau of Honshu. Most of the Japanese coalmeasures belong to the Tertiary formation. Copper plays the most important rôle among metal productions, and Japan ranks as one of the chief sources of copper in the world. The annual average of its export is estimated to be nearly 46,000,000 pounds, or two-thirds of the total production. The celebrated copper mines are Kosake and Ashio in the Northern Honshu and Besshi in the island of Shikoku. Precious metals, however, are not quite so abundant. Gold occurs both in veins and in alluvial deposits. It is produced mostly in the Province of Satsuma in Kyushu and in Northern Taiwan. The gold mines of the island of Sado in the Sea of Japan have been known for centuries. Silver is obtained in several localities, but the principal mines are Kosaka and Innai in Northern Honshu. A mine of antimony at Ichinokawa on the northern coast of Shikoku is well known, not only on account of its rich production, but also for its mineralogical importance on account of its magnificent crystals of antimony glance. The celebrated iron mine of Kamaishi is on the Pacific coast of Kitakami mountainland in Northern Honshu.

Iron is not produced in sufficient quantities to supply domestic demand. Much ironware is imported from Europe, as well as iron ore from China. The production of petroleum is annually increasing. In 1905 about 52,250,000 gallons of crude oil were obtained. Oil fields stretch along the coast of the Sea of Japan mostly in the Tertiary hills. The most productive wells are found in the province of Echigo. Sulphur is produced in several volcanoes. The quantity of precious stones found in Japan is insignificant. The only ornamental stones are quartz and agate. Topaz occurs in some places. Among building stones granite is most popular. It is quarried abundantly in Southern Honshu. Its Japanese name «Mikagé-ishi» was derived from the name of a quarry near Kobé on the coast of Osaka Bay. Andesite and tuff are other important building materials. Good porcelain-clay is obtained in several places throughout the country.

Flora and Fauna.—It is true, to a certain extent, that Japan is poor in land flora and fauna, as it consists of groups of islands separated from the continent. The empire, however, extends from the tropical nearly to the frigid zone, and approaches the continent so closely at several points, that the species of the Asiatic continent are apt to be introduced very easily into the nearest islands. Consequently, the islands are comparatively rich in number of species, which closely resemble those of the continent.

Flora.—The whole island of Taiwan is practically tropical in nature, with luxuriant vegetation, as the name «Formosa» implies. Of the plants growing on the plains, the betel-nut palm (Areca catechu), the banyans (Ficus retusa and F. wightiana), the Pandanus (P. odoratissima), the bamboo, and the tree-fern (Cyathea spinulosa) are the principal ones. The most important of the cultivated plants are rice, sugar-cane, the tea plant, the sweet potato and the ananus. The camphor tree (Cinnamomum camphora), the king of the Formosan forest, grows in woods on somewhat elevated ground, attaining 10 feet in diameter and 130-160 feet in height.

Kyushu, Shikoku, and a quarter of Honshu, south of the parallel 35° N., present some semitropical features, with several species of the oaks (Quercus glauca, Q. myrsinæfolia, etc.) and the pines (Pinus Thunbergii and P. densiflora). The stately growth of the woods of P. Thunbergii on the sand dunes gives magnicent scenery everywhere along the shores of this region. The tea plant and the wax tree (Rhus saccedanea) are extensively cultivated.

In that part of Honshu which is north of the parallel 35° N., there are found the forest trees of the temperate zones. The beech (Fagus sylvatica), «Onara» (Quercus grosseserrata), and the horse-chestnut (Aesculus turbinata) abound, often found with such species of conifers, as «hinoki» (Chamæcyparis obutosa) «sawara» (Ch. pisifera), the arbor vitæ (Thujopsis dolabrata), «sugi» (Cryptomeria japonica), and the fir-tree. (Abies firma). The mulberry tree and the lacquer tree (Rhus vernicifera) are planted abundantly. Here is found also the Ginkgo tree, a primitive conifer, indigenous to Japan, Korea and China.

These three central islands with their semitropical and temperate characteristics are the most thickly populated and most thoroughly cultivated of the whole country; so the plains and valleys are mostly covered with fields of rice and barley.

Hokkaido and Karafuto may be grouped together as belonging to the subarctic zone. In this zone, the air (Abies sachalinensis), the spruce (Picea ajanensis), and the larch (Larix leptolepis), are the chief trees in the forests. The birches (Betula), the alders (Alnus), and the poplars (Poplus) are found with these in some places. Thus, the general features are very much like those of Siberia or the northern part of North America.

In Taiwan and the central Honshu, where great elevations occur, vertical zones of flora may be traced, which very nearly coincide with the horizontal zones just mentioned, although the same species are not always represented in the proper zones.

It may be assumed that the coasts of the Sea of Japan are generally poor in the marine flora, while the coasts of the Pacific are rich in the number of species as well as of individuals. On the southern Pacific side, where Kuroshiwo or the Japanese current passes close to the shore, many species of the red algæ, Sargassum, and Ecklonia adorn the submarine rocks and cliffs; while on the northern Pacific coast, which the cold currents wash, Laminaria and Alaria grow abundantly. Alaria fistulosa nearly 300 feet in length is not rare.

Fauna.—The land animals of Taiwan are also semitropical. Among the mammals, the pangolin (Manis dalmani), with its relatives in India and Africa, is well known; the black bear (Ursus formosanus), the wild boar (Sus taivanis), and the deer (Cervus Swinhonii) belong to species different from those of the central Japan. Out of about 200 species of birds known in this island, four-fifths are similar to those of India and China, while one-half are similar to those of Japan proper. The most useful domestic animal is the bison (Bos chinensis), which is used for plowing and also supplies meat, hides and horns to the natives. Swine are bred everywhere in the islands as also in China.

Kyushu, Shikoku, and Honshu may be grouped in one faunal zone; for there is scarcely any marked line to divide them into two zones. as in the case of plants. Most of the important groups or families of animals of the temperate continent are likely to be found in this region. Among the mammals, the hares (Lepus brachyurus and L. variabilis), the wild boar (Sus leucomystax), the deer (Cervus sika), the fox (Canis japonica), «tanuki» (C. procyonoides), the otter (Lutra vulgaris), «itachi» (Putorius itatsi), and the bear (Ursus japonicus) are the principal ones. Of the birds, wild ducks (Anas), the pheasant (Phasianus versicolor), and the snipes (Scolopax) attract sportsmen. The bush warbler (Cettia cantans), and the white eye (Zosterops japonica) are common caged birds. The long tailed fowl of the province of Tosa in Shikoku deserves notice. The most remarkable facts concerning the fauna of Japan are that the monkey (Inuus speciosus) lives far north at Aomori (41° N.), and

the giant salamander (Megalobatrachus maximus) survives in the mountain streams of the western Honshu. It is also an interesting fact that the wild cat and the Chinese ring-necked pheasant (Phasianus torquatus) are found in the island of Tsushima, which is considered to be a stepping stone between the continent and central Japan in the migration of animals. Of domestic animals, horses and cattle are most common. The small silkworm (Bombyx mori) is most important economically.

The fauna of the islands north of the Tsugaru Strait is of a different character, as is also the flora. The black fox (Canis alpinus), the sea otter (Enhydra lutris), the marten (Mustela brachyura), the brown bear (Ursus arctos), and the leopard seal (Phoca fœtida) are common in this zone. The fur seal (Callorhinus ursinus), which migrates in winter to the sea off Choshi or the Tsushima Strait, breeds in summer on the rocky shores of the Chishima (Kuriles) and the Robben Island off Cape Patience in Karafuto. The gray-headed green woodpecker (Gecinus canus), the great black woodpecker (Picus martius), Blackiston's eagle owl (Bubo blackistonii), and the hazel grouse (Tetrao bonasia) are also peculiar species.

In high mountains such as are found in Taiwan and central Honshu, alpine species are often observed. The most remarkable of these are the common ptarmigan (Tetrao mutus), and Japanese alpine accentor (Accentor alpinus, erythropygius).

The fishes in the seas of Taiwan are very similar to those in the seas of the Malay Archipelago, India, and eastern Africa. "Sabahi" (Chanos chanos) are bred in large numbers in ponds on the west coast of the island. In the seas around the three central islands, there are many peculiar species, although some resemble those of the Chinese and Indian seas. Bonito (Thynnus pelamys), Tunny (Thynnus thynnus), the Spanish mackerel (Scomber colias), the snapper (Pagrus major), the sardine (Clupea melanostica), and the anchovy (Engraulis japonicus) are economically most important. The seas of Hokkaido and Karafuto, and a greater part of the Sea of Japan contain fishes of a subarctic nature; and the species found there are often similar to those of North America and occasionally to those of northern Europe. The herring (Clupea pallasii), the cod (Gadus brandtii), and the dog salmon (Onchorhychus keta) are economically most important. "Ayu" (Plecoglossus altivelis) and "Shirauwo" (Salanx) are fishes characteristic of Japan and Korea. The viviparous surf-fishes (Ditrema) and "Chika" (Hypomesus) are confined to Japan and North America. "Rabuka" (Chlamydoselachus anguineus) often caught off the Tokyo Bay, being a primitive shark, is famous throughout the whole world. The culture of the pearl oyster (Avicula martensii), and the artificial method of depositing pearls in the shells which is practiced at Shima on the coast of the Sea of Ise, are worthy of notice.

2. Japan—Physical and Racial Characteristics. See MENTAL CHARACTERISTICS: also THE DEVELOPMENT AND CONSTITUTION OF SOCIETY.

3. Japan—The Development and Constitution of Society. Except England, there is perhaps no other country so aristocratic as Japan. From the beginning of its history, there have always been some aristocrats in the land. In the first period after the era of Jimmu Tennō, we find distinction of noble and ignoble classes among the people. Those who had clan names and belonged to some clan were noble, and those who had no clan name and belonged to no clan were ignoble. Before the Reform of Taikwa period A. D. 645-6, society was entirely consituated on clanship and family associations.

Among the nobles, two clans, respectively called Omi and Muraji, stood in the highest rank. Omi was a clan name, mostly conferred on the branches of the Imperial line since Jimmu, and Muraji on the clans descended from the branches of the ancestors of Jimmu. Oomi and Omuraji were the names given to the respective chiefs of these noble clans, who were the prime ministers of the Emperor, or Mikado (Tenno in Japanized Chinese language). Below these clans, there were others which performed certain hereditary functions for the Emperor. They were called collectively Tomono-Miyatsuko. Some performed religious functions, some military, some judiciary, and

HIS IMPERIAL MAJESTY MUTSUHITO,
The Emperor of Japan.

others, weaving, sewing, cooking, forestry, fishery, etc. In fact for every social function, a clanship was constituted. They all had their own chiefs. Besides these there were also hereditary clans who had the power of the local administration in the country. They were called Kuni-no-Miyatsuko and Agatanushi. At first the local tribal chiefs, who were subjugated by Jimmu and became loyal to him, were appointed to these local functions, and later, the sons of the Emperors were also appointed.

The foreign immigrants who were naturalized and distinguished in learning and art were also given a clan name, and left some hereditary function to their descendants.

The smaller family associations were also to be distinguished within these clanships. They had their particular names and organizations, and headships. The family names were derived sometimes from their occupation, sometimes from the name of the localities where they dwelt, and sometimes from the name of their ancestors. Besides the members proper, there were clients or servants who had no clan name and so were servile to the noble class. They were perhaps the aboriginal tribes who inhabited the country before the coming of the superior race, to whom they became serfs and domestic servants.

The early society in Japan was constituted in this way, and it may be called clannish feudalism. For the clan and family chiefs owned the land and governed the people directly. The Mikado had complete power only in his private domains and in those belonging to his family. He had his jurisdiction only in those cases relating to sacrilege, treason, and the controversies between several clans and families. In such cases, the ordeal of hot water was administered as in mediæval Europe. Otherwise the clan and family chiefs had complete power of life and death over the members belonging to their clans and associations. Hence the clans and families appropriated the land and the people, and had monopoly of offices and hereditary occupations in their respective groups. And by their aggrandisements and encroachments, the feuds among them became in time interminable. So came the Reform of Taikwa era, A.D. 645-6.

This Reform was the first attempt to put an end to clannish feudalism and to introduce the form of centralized government. In many respects, it resembled the Restoration of 1868, only it was based on the ideas and institutions introduced from China. By this Reform, the land and the people were made immediate subjects of the Emperor and the State. Before this time, they were subject in the first place to their clan and family chiefs, without whose mediation the Emperor and the State could do nothing. The Reform put an end to the heredity of public functions in certain clans and families. The clan and family organizations were left as before, but the political offices were opened to all without reference to clan or family. The private ownership of land was abolished. To indemnify the owners, the whole or a part of the taxes paid by a certain number of households was given them. Every male and female above six years old was to be provided with a certain proportion of land. A boy was to receive two tan (4.90 acres) and a girl two-thirds of what a boy received. Not even the servile class was excluded. Those who belonged to the government and were public servants received the same proportion of land as the noble class. But those who were private servants received a third. For this purpose a census was to be taken every sixth year. Moreover, the association of five households living in a neighborhood was organized and put under a headman. A household in those days consisted of several families and several generations, as brothers, uncles and their children lived together with their clients and servants. A household in some cases consisted of more than 100 persons. Women were allowed to become the head of a household. But the distinction between the noble and servile classes was left untouched, although the social intermingling of the two classes was unavoidable. Some poor noblemen sold their clan names, and became servile, while natural children were constantly born to the two classes. So it was ordered by the Reform Act, that among the noble class the children should belong to the father, and among the servile class they should belong to the mother, while natural children of the two should belong to the servile class.

Thus the land and the people were nationalized. The Reform, however, was not complete until the laws of the Emperor Mommu were promulgated, A.D. 702. These laws were called Taiho-ryo. By the Reform of Taikwa, all people, except military functionaries, were prohibited from bearing swords. Even the royal members and State ministers were not exempted from this rule. By Taiho-ryo, the principle of universal military service was introduced, by which every third male was to serve as a soldier. The term of the soldiers in the capital was one year, and that of those in the sea borders three years.

But the above Reform, and regulations based on it, came at a time to be impracticable. For it was the entire reorganization of the central and local administration, as well as of the mode of land-ownership, which the State tried to introduce, while it left the clan and family associations in society as heretofore. The heredity of public functions in certain clans and families was abolished, but the same persons were employed as before in the central and local administration under different names and qualifications. The State was too weak to enforce the intended reforms, while the clanship and family associations were too deeply rooted to be overcome. In time, the Fujiwara family or clan descended from Kamatari, who with the crown prince Naka-no-oye (afterward the Emperor Tenchi) carried through the Reform of Taikwa, got the complete power of government and official functions into their hands. As the salaries of officials in those days, paid by the gifts of cloth and certain amounts of taxes from the land and the people, were not sufficient for ambitious and avaricious men, they appropriated the waste lands, and by cultivation turned them into fertile fields. Thus the private ownership of land and private jurisdiction was soon revived, and increased more and more. Within these private lands called Sho-yen, the central

and local governments had no power of administration and the personal and household taxes were free, while the taxes on land were very light. So the increase of these lands subtracted in fact so much from the power of the Emperor and the State, that the Court tried to put an end to this private system of ownership and jurisdiction. But being unable to prohibit it, the Court finally succumbed to it; that is, the Court sanctioned it, and had its own private domain and jurisdiction.

As the central government was too feeble, and the system of universal military service and drill was not carried out, there arose men who made fighting their special occupation. They were afterward called Bushi or Samurai. (See JAPAN—THE SAMURAI.) In the meantime, the old clanship and family associations were entirely confused, but the new clanship and associations arose in their place. Such was the Fujiwara Clan, and after it came Tachibana, Taira, and Minamoto clans in succession. They were the nobles of the capital, branched out from the Imperial Family, whose descendants and relations were ramified throughout the country. As the government was too weak to protect the life and property of the people, the noble clans attached to themselves the people, and especially the fighting men became their retainers. In the capital (Kyoto) the Fujiwara Clan held the perfect control of government for several centuries. But they were mostly civilians and had need of generals who could fight. Now the two clans of Taira and Minamoto, which title was bestowed by the Emperor, respectively descended from the younger sons of the Emperors Kwammu (A.D. 782-806), and Seiwa (A.D. 859-877), became very powerful as military leaders. They were not able to compete with the Fujiwara Clan in civil administration and at the Court, and so they served as generals and as local governors, where there was much disturbance. They grew up to be two great rival clans in the capital and throughout the country. The fighting men, and in fact, most people who had landed property, became their retainers. Thus the new feudalism, based on land and local associations and attached to the military clans of Taira or Minamoto, was gradually formed in spite of the prohibitions and remonstrances from the central government. Finally, the Emperor, the Fujiwara Clan and their several families were powerless against the two military clans, who had successively fought with each other for the supremacy in the capital and in the country. The Minamoto Clan vanquished the Taira Clan under the leadership of the two brothers, Yoritomo and Yoshitsune. Yoritomo (A.D. 1186-1200) was the founder of military government and organizer of territorial feudalism, which continued down to the Restoration of 1868. Yoritomo was the first Shogun (general in chief) in the special sense of that term. He established military court called Bakufu at Kamakura, which was the second capital and the centre of military government for 146 years (A.D. 1186-1332). Yoritomo, by the sanction of the Emperor, established the military chiefs in every province side by side with the civil governors appointed by the Court. Thus peace and order were preserved, after civil wars had distracted the whole country. The code of honor and allegiance to some military chiefs besides the Emperor, now called Bushido, arose in this period. The virtues of courage, loyalty, magnanimity, simplicity and frugality were inculcated by Yoritomo and his contemporaries. From this period also those who had large private estates and many retainers were called Daimyo (greater barons), and those who had smaller estates, Shomyo (lesser barons).

After the Ashikaga family, a scion of the Minamoto Clan, succeeded in the military government of the country, A.D. 1336, and established Bakufu at Kyoto, the dual system of local administration was done away, and only the military governors appointed by the Shoguns were left in the provinces. The office of these local governors became hereditary functions, the ownership of land and political jurisdiction were now identified, and thus the feudal system was made complete. At first the retainers of military chiefs tilled the soil in the time of peace, and were soldiers only in the time of war. But during the Ashikaga period (A. D. 1338-1573), wars were so constant and general that fighting was the only occupation of the retainers. Thus the military class and the industrial class became entirely distinct, although there was of course constant recruiting from, and mixing with, each other.

Under Tokugawa Iyeyasu, also a scion of the Minamoto Clan and the victor of the famous battle of Sekigahara (A.D. 1600), the most perfect form of feudalism was established and continued down to the present era. Bakufu was established at Yedo, now Tokyo, which very soon became the largest city in Japan. During this Tokugawa period, the Emperor was powerless, more so than during the Kamakura and Ashikaga periods, but was none the less held divine as before. Iyeyasu and his descendants were able to hold the whole country in peace, almost without intermission during the two centuries and a half. The function of the Shogun was hereditary, but it needed the Imperial investiture every time. The whole country was distributed to the military chiefs or nobles, most of whom arose during the civil wars at the end of the Ashikaga dynasty. These territorial nobles had complete power of government within their provinces, and no appeal to the central government was allowed against their decisions in civil and criminal cases. But they were responsible to Bakufu for misgovernment. Their succession and marriage required the sanction of Yedo government. So long as they governed their provinces well, they were allowed to hold their fiefs and to transmit them to their descendants. Bakufu only regulated the military, monetary and postal and foreign affairs.

During the Kamakura and Ashikaga periods one knight and several foot soldiers were perhaps furnished from every unit of feudal tenure. In the latter period the land tax was paid in money in some localities, but Hideyoshi enforced the ancient custom of payment in rice, which was followed by Iyeyasu and continued till 1873. According to the regulation of the Kwanyei period (1624-43), the Tokugawa government demanded from all land producing 1,000 koku of rice (a koku is equal

GATE OF THE GOLDEN TEMPLE, TOKIO.

to 4.9629 bushels) 23 soldiers, 2 spears, 1 bow, 1 musket; from all land producing 10,000 koku of rice, 235 foot soldiers, 10 knights, 10 bows, 20 muskets, 30 spears; from all land producing 100,000 koku of rice, 2,055 foot soldiers, 170 knights, 60 bows, 350 muskets, 150 spears, and so on in the same proportion. During the Genroku period (1688-1703), it is said that the whole country, with the exception of the island Tsushima, produced 25,786,895 koku of rice. Now the Tokugawa government owned, as its immediate feudal tenure, the land which produced 8,000,000 koku of rice. It was more than one-third of the produce of the whole country. The greatest territorial noble had only 1,000,000 koku of rice for his income. So the Yedo government, under the Shoguns and their immediate soldiers, was the most powerful feudatory in the country, and by the aid of the other branches of the Tokugawa family and former retainers now settled as territorial nobles in various provinces, was able to keep the most insubordinate feudal nobles in peace. The territorial nobles who had the income of 10,000 koku of rice and upward were entitled to be called Daimyo. These Diamyo or territorial nobles were obliged to leave as hostages their wives and children at Yedo. They had to attend the Court at Yedo every year at first and later every other year. They had to aid Bakufu in cases of great occasions and expensive public works and had of course to furnish contingents when the general or special levy was ordered. Military levy was also made on the military class who had the income of less than 10,000 koku of rice.

The land of Daimyos who had no sons to succeed them was escheated at first, but later the Daimyos were allowed to name their successors. The military class, including the Daimyos and their retainers, all came under the jurisdiction of Bakufu. Bushi or Samurai were nearly all of them retainers of some Daimyos. They were obliged to bear two swords, one long and one short. They all had family names besides their personal names. They were carefully educated in the art of fighting, and also in the Chinese classics. They were thus taught Bushido, and Confucian ethics. They were the fighting class, but from them all the civil officers were supplied. They were free from taxation, and were exempted from criminal law. The code of honor was their supreme law. In case they committed great wrong, they were permitted to punish themselves by means of Harakiri, or honorable suicide. But if they committed heinous crimes unworthy of Samurai, they were first deprived of their Samurai rank or gentility, and then they were punished as any other criminal belonging to Heimin class (common people).

Besides these retainers, there were free Samurai who had no lord to serve. They were called Ronin (floating men). They were originally retainers of some Daimyos, but they lost or for some reason left their lord, and so became lordless Samurai. They were permitted to have family names, and bear two swords like all the rest of the military class. They were very independent and a source of great trouble to the government. But the principle of Bushido was sometimes best exemplified by these men, as is well known by the story of the forty-seven Ronins.

The physicians, priests and scholars did not belong to any feudal classification. They did not belong to Samurai. So they were legally Heimin (common people), but they were not so treated. They were honored and respected. The physicians and scholars were entitled to have family names and bear swords (physicians only one). They at first shaved their heads just as the Buddhist priests do even now. This was for the reason that during the Ashikaga period the civil wars were so general and learning declined so much that the priests alone were the learned class as in the dark ages of mediæval Europe. During the regency of Shogun Tsunayoshi, A.D. 1681-1709, scholars ceased to shave their heads, but the physicians commonly did shave their heads till the present era.

The Buddhist priests were the great instrument in the spiritual and material civilization of Japan. As militarism prevailed in the country, they alone had the key of knowledge and education. Some of them were teachers and counselors to the Emperors, Shoguns, and local magnates. They were universally recognized as such by the common people. During the Tokugawa period, the special class of scholars arose, and the government undertook the education of the military class. But the education of the common people was left still to priests and private persons. Hence all private schools devoted to the education of the common people were called Terakoya or church-schools. To send children to the church meant to send them to school. As scholars arose the privilege of educating the children was not monopolized by the priests as in the previous periods, but their influence was enhanced in another direction. Since Christianity, that is (Roman Catholicism), was entirely prohibited (A.D. 1636), every Japanese was obliged to belong to some Buddhistic church. Thus the priests had the power of census in their hands. All births, deaths and marriages were registered by the priests, and their certificates were necessary. Every Buddhist church had its constituents among the people, who supported the priests and the temples belonging to them. The priestly functions were open to all classes, if they wished to enter them. In the age of militarism and hereditary nobility, priesthoods alone were free to all. Those, therefore, who were tired of worldly ambition, fond of learning, and were offended at the feudal caste-system, entered the priesthood.

The art of healing was highly respected in Japan and physicians were employed as court doctors both in the central and local governments. In fact it was the art of healing which saved Japan from oriental stagnation and decay. It was in the year 1771 A.D. that a few able physicians in Yedo began the study of the Dutch language and medicine, which finally opened the eyes of the intellectual class to western science and civilization. «Be a prime minister or become a physician, for they are both benevolent arts,» was a common saying in China, and it continues to be so in Japan until this day, though the maxim itself was forgotten long ago in China.

Heimin or the common people consisted of two classes. Those who lived in villages were called Hiyakusho. They were peasants. Those who lived in the towns were called Chonin. They were merchants, traders, and artisans. They were not allowed to have family names or bear swords. Merchants and traders had their shop-name, and used it before their personal names. Otherwise they named their particular trade. So did also peasants. They called themselves Hiyakusho so and so. But by exceptional merit, they were sometimes entitled to have family names and bear swords, which was considered a great honor. At first the Heimin were allowed to bear swords, but as it proved dangerous long swords were prohibited to them, A.D. 1644, and finally all swords were prohibited, A.D. 1668.

The town people, or Chonin, were put under the jurisdiction of a machi-bugyo or governor, but they were largely left to their own self-government. The Elders, called Machi-Toshiyori, were selected and appointed from them (there were three in Yedo). Below them, there were Nanushi, or headmen, for one or more streets (268 in Yedo). Under these there were Jinushi or land-proprietors, and Yanushi or house-owners, who performed various important functions for their wards. There were also Goningumi (five-men-association), consisting of five neighboring households organized for mutual help.

It was the same with regard to the administration of the villages. In each village there was a headman called sometimes Nanushi, but usually Shoya. He was elected by the peasants themselves from one of the most honorable families among them. His term of office was sometimes for life and sometimes for a number of years. There were also the Goningumi and its headman; deputies of peasants who participated in the administration of the villages, and sometimes there were Ojoya or great headmen who were superintendents over the headmen or shoyas of several villages, sometimes 10, 20 or more villages.

Below the Heimin class, there were outcasts and beggars, respectively called Yeta and Hinin. The Yeta class were butchers, and they were specially despised, as Buddhism taught men not to kill animals. These people were allowed to live only in certain districts and quarters, and there were some villages called Yeta-mura, where the Yeta class only dwelt.

In Yedo, these classes were put under the jurisdiction of special men, selected from their number, to govern them. In case a Heimin became a beggar, he could retrieve his position by industry. But if he married a beggar woman and begot children, he could return to his former class, but she and her children could not rise with him into the Heimin class.

Three years after the Restoration (1871), all classes were allowed to intermarry with each other. And in the same year, the names Yeta and Hinin were abolished, and the outcasts and beggars were also incorporated within the Heimin or common people.

A kind of slavery existed from a very early period. That is, poor people sold themselves to the rich and noble. During the Kamakura period, there came to be a special sort of tradesmen called Hito-akibito, engaged in buying and selling servants. The government prohibited this kind of trade, but could not stop it. In the Ashikaga period, they kidnapped young boys and girls and sold them. This continued down to the Tokugawa period, when it was made a capital offence. The government at one time even tried to limit the term of engagements of the servants to 10 years. In fact, in 1872 long engagements were prohibited as slavish, and restricted to one year.

The morality of sexes has always been the weakest part of oriental ethics in general. It was so in Japan. Divorce was easy, and concubines and mistresses were permitted to the noble and the wealthy. But in spite of all irregularities and licentious practices in fact, monogamy has always been a legal marriage. That is, bigamy or polygamy in a literal sense was not recognized by the law. Only one woman was a man's proper wife. So there has been only one queen, properly so called. That was a rule, though there were some exceptions in some corrupt periods of Japanese history. In primitive Japan, a marriage was allowed between brothers and sisters of different mothers. It was a universal custom that a woman should not go over to her husband's house after her marriage. She staid at her own home, which the husband frequented as a visitor. On the marriage day, a bridegroom went to the bride's house, where there was a feast prepared. Even to this day, in the marriage ceremony a nuptial cup is first given to the bride, and after she drinks, it is given to the bridegroom. It means that she is the host and the bridegroom is the guest. It continued to be a custom for a long period of time, that the wife should remain at her parental home for several months or even several years after her marriage before she was taken over to her husband's house.

After the Kamakura period, it came to be a custom that the wife should be taken to her husband's home immediately after the day of marriage, which took place at her house. Later, the bride was taken to the bridegroom's home from the first, and the marriage ceremony itself was performed at his house. However, even during the Tokugawa period and in fact till to-day, a woman always keeps her own family name, which is used as her honorary title and shows her good breeding.

During the Kamakura period, a wife was able to have her dowry as her own property, which was not allowed to be mixed up with that of her husband. Even when her husband's property was confiscated, her property was not touched, except in case of heinous crimes such as treason, murder, and robbery. If she was divorced and a child was born after her divorce, a boy went to the father and a daughter to the mother, but until 10 years old, the boy was allowed to remain with his mother. It was the original custom in Japan that property should be divided among all children and even to the relatives. It was so in the Kamakura period. In case the owner did not execute his will before his death, the government did it according to its discretion. If there was no child or relative left to succeed

OSAKA CASTLE.

to his property, it was given over to the temples and the churches.

During the same period, land was sold freely, but the military class was prohibited to sell the beneficiary land given by the government as a reward. Later even hereditary land was not allowed to be sold to the lower class. During the Ashikaga period, primogeniture in the male line became more and more the rule for the succession of estates. And it was made the strict law during the Tokugawa dynasty. Division of estates was not permitted, and the eldest son inherited the whole property of his father, while it was made his obligation to support all his brothers and sisters. As the younger sons could not inherit any property from their father, they had to be adopted by a childless Samurai before they were permitted to marry, and unless they were very distinguished in talent and ability, they were not allowed to start a new family.

The Tokugawa government prohibited a peasant to change his occupation and to become a tradesman. He was not permitted to sell his soil, and divide it among his children in case it was not more than one cho (2.45 acres) in extent. In fact, all sale of land for perpetuity was not allowed except in the cities of Yedo, Kyoto, and Osaka. Even its transference was restricted by law, in order to prevent the accumulation of estates in the hands of a few large proprietors. Throughout the whole history of Japan, the legal principle relating to land was that the proprietary right belonged only to the State. In the year of the Restoration, 1868, the land belonging to the villages was turned over to the peasants, and the sale of land for perpetuity was legally allowed in 1872.

From very early times there was a ceremony called Gembuku, observed when children grew up to be mature. It was so called because the dress of an adult was to be worn from that time. It was called Ui kamuri (new cap), because a man's cap was given for the first time. The age was not fixed by law, but usually at 15 or 16. In the case of Emperors and rulers, the ceremony was performed even in childhood. It was performed sometimes at night and sometimes in day time, and it was considered a matter of great importance, especially by the military class. A master was needed for its performance. He was either a chief-man of the clan or family, or the suzerain to whom he owed his allegiance. He was called Eboshi oya or sponsor (Kamuri is a general term for cap, and Eboshi is a special term for a kind of cap formerly worn by the Japanese nobles). During the Tokugawa dynasty, a cap was omitted except in the case of court and territorial nobles. The retainers only changed the manner of hair dressing at this ceremony. Now this custom is obsolete.

Society in Japan as it has historically developed and as it now stands, is legally distinguished into four classes: (1) Kwozoku, or the Imperial family; (2) Kwazoku, or the Nobility; (3) Shizoku, or the old Samurai or Bushi; (4) Heimin, or the Common People.

1. Kwozoku.—The Imperial Family in Japan is the oldest existing royal family in the world. The Mikado or Emperor is the earliest institution, and stands at the basis of all other institutions in the country. The present Emperor is the 122d of the Imperial line. No King or Emperor or President has such unanimous reverence and love of his subjects. The people are very proud of the fact that the reigning Imperial family has descended from time immemorial in an unbroken line of succession to the present. Indeed, the Imperial family is now the emblem and embodiment of national immortality. It signifies the fact that Japan has never been conquered by the outside nations. It means that the Imperial house and the people are one and inseparable elements of the State. It signifies also that in spite of great social and political revolutions which the people have undergone in the past, there is something steady and consistent in the national character. Since the 8th century A.D. the Imperial family have reigned but have not governed. The noble families one after another took possession of the governmental power. Still they all governed in the name of the Emperor, or some member of the Imperial family. Throughout the whole history of Japan, the Emperor has been the fountain of honor and the bestower of the official degree of rank and title on all functionaries, including the Shoguns and the Daimyos. Before the present Constitution was promulgated (1889), the female succession to the throne was constitutional, and Japan has had six Empresses among the sovereigns of the past. Hereafter the throne shall be succeeded to only by male descendants in the male line.

2. Kwazoku.—This is the title of the nobility in Japan, legally adopted in 1869 when the old appellations of court and territorial nobles were abolished. However, the existing orders of nobility were created only in 1884, and the nobles were classified into five orders of Princes, Marquises, Counts, Viscounts, and Barons. Among them are three classes distinguishable. First comes the old court nobility called Kugĕ. They are the oldest families of all the nobles, some of them being more than 1,000 years in existence. Before the Restoration, they were all very poor and abject in condition. On account of the feudal system which prevailed they had no work but to attend the Emperor and discuss the matter of bestowing honorary degrees of rank and title. Next come the old Daimyos or territorial nobles, who were the former local hereditary rulers. Some families among them are seven or eight hundred years, and some about three hundred years old. They voluntarily gave up their lands and people to the Emperor in 1869, when they were made the local governors instead of Daimyos. But the system of local autonomy was entirely abolished in 1871, when they were forever removed from their provinces and removed to Tokyo. Last but not least are the new nobles created since 1884. Prominent among them are the statesmen and generals who broke up the Shogunate and the feudal system, established Parliament and the Constitutional government and brought to the successful issue the wars with China and Russia.

3. Shizoku.—This is the title legalized also in 1869, to be applied to the retainers of the

Daimyos. At first the lowest class of retainers were called Sotsu, but this distinction was abolished in 1872. They had been a privileged class, with hereditary pensions. The leaders among them were the chief movers in the abolition of the Shogunate and the Restoration of the Emperor to power. With the downfall of feudalism and the decree of universal military service issued in 1873, they lost their hereditary military function, and in the same year another degree was promulgated, announcing that the government was ready to commute the pensions of the Shizoku at the rate of six years' purchase for hereditary pensions and four years for life pensions—one-half of the commutation to be paid in cash, and one-half in bonds bearing interest at the rate of 8 per cent. Many of them voluntarily gave up their pensions for this meagre commutation, determined to earn their living hereafter by industry and trade. But there were also many who could not adapt themselves to this new condition, and so they were for some years the constant source of local disturbances and insurrections against the new government. But the vast majority of them entered the civil and military service in the new government, and also engaged in the work of education. The universal military service and universal common education, based on the western system, led by these men as captains and teachers, was wonderfully successful, as is shown by recent results.

4. Heimin.—To this class belong mostly the common people engaged in trades and commerce, field tillage and all kinds of manual labor. The distinctions between the Shizoku and the Heimin are only nominal and fast disappearing, for many of the former Samurai are now engaged in tilling the soil and in every kind of industry and trade, while those belonging to the former Hiyakusho and Chonin are legally equal to Shizoku in all respects. Universal military service and universal education are making them all equal or nearly equal in spirit and character. The Heimin fought as common soldiers against the Samurai class when they rose against the new government; they finally put down the Satsuma Rebellion in 1876, and in the wars with China and Russia, their courage, valor and devotion were signally displayed.

Even before the Restoration, the Heimin class had imbibed the chivalric elements of the military class in their theatres and Yose (houses where public entertainments were given), and now that education is made universal and the constitution has secured to them equal rights and privileges, it is no wonder that they are fast rising into power.

According to recent statistics (1903), the population was divided among the various classes as follows: Imperial family, 66; Kwazoku, 5,055; Shizoku, 2,168,058; Heimin, 44,558,287. It stood as follows in 1872: Kwazoku, 2,666; Shizoku, 1,282,167; Heimin, 31,825,963. The nobility was strengthened by the creation of new members. The Shizoku, notwithstanding their disorganization and poverty, were able to increase greatly in population, and their assimilation with the common class has been the most powerful means in raising the spirit and character of the whole nation.

Though the division into noble and servile classes has always existed in Japan, it was not a caste system in fact. Though a legal marriage between them did not take place as a rule, concubinage constantly infused democratic blood into the families of the higher class. When a wife was childless the sons of concubines became heirs, and the noble women were not so fertile as women of the lower class, the blood of aristocracy in Japan has become very democratic notwithstanding high pedigrees and pretensions. Moreover, as local and general wars were so frequent until the beginning of the 17th century, the ruined aristocratic families and their retainers were constantly forced into the lower class, so that there was a perpetual influx of aristocratic blood into the veins of the common people. This explains why, under certain circumstances, the Japanese aristocrats are very progressive and even democratic, and why the common people themselves are so aristocratic and love aristocracy as the natural form of social institutions.

Two things distinguish society in Japan from that of Europe and America. In the first place, family, and not the individual, is still the living social unit. Ancestor worship is still a living religion in every family. The freedom of faith is recognized by the constitution and there is no particular ecclesiastical organization sanctioned and favored by the State. So the people are Buddhists, Shintoists, Confucianists, and Christians, according to their individual tastes. But it may be said that ancestor worship is still common to all classes. In each family there is a legally recognized head, who has the reins of domestic government. Moreover, a council held by relatives is authorized and recognized by the law. The continuity of the family name and its succession is regarded as so important, that the adoption of sons and daughters is still practiced by those who have no children.

In the second place, the State is all in all in Japan. The idea of the State is exactly that of the ancient Greeks and Romans. The State is a whole and the individual a part. The State has existed so long and developed so strong that no one thinks of rights not bestowed and recognized by the State. In Europe, the Church existed before the State, and the strong and mighty influence it has still is known to all. In Japan, there is no conflict between the State and the Church. The State existed before the introduction of Confucianism, Buddhism, and Christianity, so that there has never been and can never be any religious association claiming rights above the State, as in mediæval Europe. So the State and the Church are completely separate. The State holds in its hand the entire control of education, marriage, and the civil status of every individual. Japan is wholly free from religious embarrassments in these respects. After half a

FUJIYAMA, FROM TOKAIDO ROAD.

century of great political and social transformations, all classes are in unison and equally progressive and conservative. There are some radicalists in politics and thought, but no anarchist. There are many conservatives, but no reactionary. The organizations and strikes of laborers have already begun, together with the introduction of the modern factory system and its defects. But the socialists as a party have as yet no existence in Japan. Herein lies the strength and weakness of Japanese society. Though strong and united as no other nation is, individually and socially speaking, Japan is still a youth and mediocre.

KAZUTAMI UKITA,
Professor of History and Sociology, Waseda University, Tokyo.

4. Japan—Mental Characteristics of the Japanese. There are few subjects where anything approaching scientific exactness is more difficult, or even impossible, than those which fall under the general title of «Race Psychology.» The very facts which might serve as the basis for an acceptable and trustworthy conclusion are exceedingly abstruse and complex; they are indeed of such a character as to require for their detection and appreciation a trained and experienced observer. But supposing the facts to be admitted, there are then no well established principles under the guidance of which the facts may receive a satisfactory theoretical treatment. For there is no universal agreement as to the existence of definite race temperaments; while, with those observers who accept the theory of specific mental characteristics for different tribes and nations, the practical application of their theory to particular cases is not accustomed to produce very satisfactory results. Nevertheless, we are believers in the existence and predominating influence of temperament considered as manifesting itself in large collections of individuals who share the same admixture of blood, through long periods of time; we believe also that, while temperament is profoundly modified by changes in climate, in food and other economic conditions, and in the extent and forms of the prevailing social intercourse, it continues to manifest itself in many subtle and complicated but powerfully influential ways. In applying this belief to any particular people, however, one or two important considerations can never be safely lost out of mind. The first and most important of these is the spiritual unity of all the different races in one human race. This fact of an essential spiritual unity, as enunciated and illustrated by anthropologists like Waitz and others, may be accepted as a fundamental factor in the solution of all the psychological problems belonging to this class. As far back as we can go in history, and as far afield from the centres of race-culture to the extreme borders of barbarism and savagism, human nature appears to be essentially the same. Even that mythical being called «primitive man» is not exempt from this conclusion. And so long as we remain upon sound empirical grounds it must be admitted that a far wider gap exists between the lowest of the human species and the highest of the lower animals, than between the lowest and the highest of the *genus homo*, or the highest of this genus and its own most successful efforts to picture the nature of the angelic and the divine. Man's God is more like man than man is like the man-like ape. This consideration must, however, be modified by the following admissions. In every large group of human beings which have for a long time had essentially the same common ancestry, there is developed a peculiar mixture of mental, as well as physical characteristics, which constitutes for the average individual what may properly be called a race temperament. But, still further, in every such large collection of individuals, while a certain average quality may be detected as belonging to the great majority, many important differences must be observed. Thus all the different temperaments appear, in a more or less distinctly marked form, even among those peoples which are as a whole most definitely characterized by a so-called race temperament. And, finally, as the physical and social environment of any people, however exclusively its temperamental mixture may have remained, undergoes either slow or more rapid but important changes, the mental characteristics of the race seem to become altered or obscured. We believe, however, that they really remain a most powerful factor in determining the nation's development and destiny.

In attempting, then, to describe the mental characteristics of the Japanese it is assumed that they are in all essential respects *like ourselves*—whether by «ourselves» be meant Americans, English, German, French, or, as well, the more important races of both the Near and the Far East. Simple and even vague and inconclusive as the proposition may seem to be, the essential humanity of the race is the most indispensable consideration to be borne in mind by the observer, whether from the practical or the more strictly scientific point of view. This consideration, however, serves rather to emphasize the further truth, that a certain characteristic mixture of mental and moral qualities may be observed, which is quite worthy to be called the «Japanese temperament.» Here human nature has attained a highly specialized type. In a word, there is probably no other one of the foremost and equally populous nations of the world whose mental characteristics, as developed on a basis of race temperament, are more strongly marked. And the reasons for this are not difficult to discover.

So far as the obscure problem of the race origins of the Japanese can be solved by modern ethnographic authority, the most probable conclusion may be stated in the following way. The Japanese originated as a mixture of Tartar or Mongolian (in the larger and somewhat looser, but not altogether inappropriate use of the latter term) and Malay immigrants with the Ainus and traces of other indigenous elements. It is a not improbable conjecture that the varied and conflicting character of the elements which thus became combined accounts for some of the more puzzling features of that national temperament which has resulted from this mixture of races. Interesting differences characterize the Mongolian and Malay peoples; and both of these differ in important ways from what we know of the Ainus and other less known tribes indigenous to Japan. As supremely

important moulding influences to determine the mental characteristics of the Japanese of to-day, two historical facts demand our attention. However different, or even conflicting, the original elements may have been, they were welded into a common typical form by a long period of comparative isolation and exclusion of other admixture with foreign elements. Thus, out of these very different and conflicting elements a basic temperament was formed which itself is strongly marked, is indeed rather unique. Through generations, and even through centuries (for the educational and artistic influences from China and Korea did not modify the result in an important way, so far as this temperament was concerned), the process of specializing by combining and recombining the same elements went on without interruption from outside sources. The second historical fact is recent. After centuries of physical and social isolation, such as is favorable to the production of a specific type, there has followed a half-century of rapid changes due to altered relations toward foreign influences. These recent changes have, however, as yet resulted in very little admixture of foreign blood. They have had, therefore, no important effect upon the temperament, or the hereditary mental characteristics of the Japanese as a people. But they have, of course, produced important alterations in the physical and social manifestations of these characteristics. On the one hand, they have had the effect to excite and to confuse, for the time being, the minds, the morals, the ancestral ideas and customs, of the people; and to make upon the superficial observer a variety of bewildering and contradictory impressions which is extremely unfavorable to a clear and trustworthy understanding of the most fundamental facts and the most effective influences. On the other hand, this period of rapid change is defining, deepening, and developing the Japanese temperament, and of course also, the essential mental and moral characteristics which rest upon it as on their base. Inasmuch as a large measure of adaptability to a variety of new impressions is especially characteristic of this type of temperament itself, it is reasonable to expect that the Japanese will in time adjust themselves to these recent changes without a total loss of or even an essential change in their national character.

When we come to inquire, therefore, as to what term shall be employed to designate the temperament of the Japanese, the answer may be given with a rather unusual degree of confidence by one who knows them intimately. For the ethnographic conditions and the historical influences have combined to give the nation a distinct quality. This temperament is predominatingly sentimental, although with considerable infusion of the choleric. The sentimental temperament is characterized by great sensitiveness to all kinds of impressions, especially those of a sensuous and æsthetical order; by varied, strong, and oftentimes sudden and even conflicting and tumultuous reactions; by an eager but somewhat naïve intellectual curiosity and a versatile gift of adaptibility; by a lively, picturesque, and concrete, but usually not profound or scientifically controlled imagination; by warm, responsive, but rather unstable emotions; by a splendid power to attain, under trying emergencies, the heights of moral and religious devotion and achievement, and yet a tendency to carry to extremes certain particulars, and thus to miss somewhat of the controlling principle of an ethical harmony; and a disposition to deal with moral and religious truths as though they are matters worthy of only a passing curious inquiry rather than concerned with the profounder insights and most important activities of human life.

If now we adopt this description as in the main characterizing that racial temperament which underlies and shapes the mind and life of the Japanese people at large, we must at once remind ourselves of certain important modifying considerations. As among every gifted and highly developed people, so in Japan, there are many examples of other temperaments or temperamental mixtures. And indeed, no so-called «race temperament» can remain *pure*. That intense and persistent energy, combined with intellectual sagacity and the power to organize and to achieve practical results by following up one's purposes with a consistent and unswerving determination, which is characteristic of the choleric temperament, has been well marked in the case of many of the great men of Japan. And, indeed, it has modified without essentially altering the sentimental temperament characteristic of the body of the people. This fact, however, enables us only the better to understand both the strength and the weaknesses of the mental constitution of the Japanese. When instructed and disciplined, as it was under the old régime among the Samurai, it produced many splendid examples of a noteworthy and admirable but one-sided chivalry. It has given birth to much art which is exquisite in its appreciation of natural beauty and of the more tender, as well as heroic, interests and relations of human life. It produced a system of nicely adjusted customs and manners, where appropriateness and a subtly adapted symbolism ruled over the conduct of classes, and gave an air of good breeding to all. And nowhere else, in the world's history, have there been more notable examples of supreme, self-sacrificing devotion to persons and to a chosen cause.

On the other hand, it must be admitted that a certain instability, or lack of steadiness, often amounting to fickleness, and a tendency to reverse movement, to change opinions, parties and sides, even to entertain contradictory plans and purposes, characterize the sentimental temperament. In this way must we account for the extremely puzzling nature, to the man of a different race temperament and of Occidental culture, of many of the mental characteristics and of much of the conduct of the Japanese people as a whole. In the same way may we explain—at least in part—the diverse judgment and warm liking or dislike which are apt to be evoked in the case of different persons who have had an equally good and long-continued opportunity for forming an intimate acquaintance with the subject. It is peculiarly difficult to know the Japanese at all thoroughly, and to maintain toward them an attitude of indifference. And it is highly significant of the real truth that those who know them best, through association in what may be denominated the most honorable and distinctly personal ways, with certain rather rare exceptions, like them best. While

so subtle, complicated, and subject to varied impressions and to sudden, strong, and even contradictory reactions, is their type of character, that it remains not well understood, if not wholly misunderstood, by the great majority of observers. With this confessedly vague and imperfect, but—as we believe—suggestive and determinative characterization of the race temperament of the Japanese, we now proceed to a further analysis of their prominent mental and moral characteristics.

With regard to the fundamental appetites and passions of human nature, no well-defined difference appears between the Japanese and the inhabitants of the different highly civilized parts of Europe and America. Centuries of an almost complete disuse of animal food, combined with the climatic influences of those regions of Japan that are the most populous, may have had some important effect in bringing about an absence of the manifestation of physical vigor, and of that energetic and direct way of going about the business in hand which characterizes the Anglo-Saxon and Teutonic races. The philosophy of life which was introduced by Buddhism, and which has, together with Confucian ethics, influenced the upper classes and filtered down through the lower orders of the people, has also been of great importance. In such matters, in Japan as everywhere else, economic considerations are also very powerful. Whatever the causes may have been, the Japanese have never been, and are not now, so much given to gluttony and to intemperance as the people of Northern Europe.

In the past, and even down to the present time, the sexual relations of the Japanese have been characterized by a certain greater degree of looseness and lack of moral and social restraint than has been the case among the people of Europe and of North America. This has not been due, however, to any excess of sexual appetite or to deficiency in moral feeling or lack of a moral code. It has chiefly been due to the social constitution of the people, and to the fact that the prevailing ethical and religious opinions and principles did not emphasize the sexual relation as being, primarily considered, a matter of ethical concernment. We have, therefore, on the one hand a certain naïve openness of speech and of conduct in these matters, such as astonishes and shocks the reader of the Kojiki and of much of the older and more modern literature, as well as the observer of customs which have prevailed well down into the modern era. Such are phallic worship in religion, concubinage, licensed prostitution, promiscuous bathing and free exposure of the person, as well as a relatively low estimate put upon the value of sexual purity as a personal virtue, when considered apart from the sentiment of loyalty. On the other hand, there is in Japan a relative absence of the more coarse and brutal forms of sensuality; and on the part of woman a traditional willingness for self-sacrifice which it is difficult even to explain, and much less to justify, to the Occidental mind, but which frequently springs from the very noblest sentiments of devotion and loyalty. The changes for the better, both in opinion and in practice, which are taking place in the country, make it perfectly clear that inferiority, whether from the point of view of intellect or morality cannot be charged against the Japanese in this regard. Indeed, the traditional absence of hypocrisy with respect to the *morale* of sexual relations is to their credit rather than otherwise. It is also worthy of mention, and even of no small significance, that the more serious moral and religious didactic literature of the Japanese, as represented in dramatic form by the «No,» is almost absolutely free from any impure suggestions.

As to the other emotions and sentiments, the life of feeling among the Japanese corresponds in general to the type already described. Anger, jealousy, envy, grief, sympathy, and the domestic and friendly emotions, are quick to kindle, and tend to run to excess or to change to their opposites when they have either become themselves exhausted or have seized upon any observed or imagined reason for change. But the artistic feeling which produces a fine sense of propriety and a regard for personal dignity, reinforced by that carefully defined and legally guarded system of rules of behavior (especially under the Tokugawa dynasty), to which reference has already been made, serve to modify and repress the manifestation of these feelings. Even smiles and laughter come often to be the mask of grief and sadness rather than the expression of happiness and rejoicing. Hate and love, jealousy and sympathy, strong dislike and strong liking, hide behind an unmoved or courteous demeanor, and finally break forth to the surprise of the foreigner who is self-deceived, rather than deliberately deceived by others, through a lack either of insight or of sympathy. Thus the subtle, complicated, and indirect, rather than the open, simple, and frank character of the mental life becomes still further emphasized in the conduct of the Japanese. Here again, however, under the prevailing sense of honor and the ruling principle of loyalty, as the one belongs both to the temperament and to the historical development of the people, and as the other is the gift of the Confucian ethics emphasized and deepened by the same historical development, the very highest examples of a knightly and trustworthy manhood have been commendably frequent in Japan. [The sentiment of beauty, as a specialized form of feeling, is so characteristic a feature of the people, both in any attempt to discover the temperament of the race and also in the estimate of their present conditions, social and artistic, that it deserves recognition in another connection.]

More particular examination of the intellectual traits of the Japanese calls for something like the following analysis. These traits are such, however, as on the whole go with, or rather are an integral part of the sentimental temperament in its higher and finer forms of culture. And, first, we may note an exceedingly vivid, enterprising, and, so to say, hopeful intellectual interest and a widely varied intellectual curiosity. The average Japanese has an inquiring mind. This often manifests itself as a naïve and almost childish desire to know how natural objects are constituted and how manufactured articles are made. It is back of the quiet, open-eyed wonder with which the children stare at the manners and dress of the foreigner (marked by an almost complete absence of any tendency to rudeness or violence); and it shows

itself in that semi-religious feeling of mystery with which the displays of freakishness, as well as of power, by nature are regarded. What has been called the «hopeful» character of this varied intellectual interest leads to the ready confidence that whatever any one else has made may as well, or even better, be made by the Japanese; and it is perhaps also influential in producing the so frequent conviction that even the fundamental mysteries of existence and of human life are not beyond the possibility of a new and much improved solution by some adventuresome young Japanese philosopher who may add the training of modern science to his own extraordinary native ability.

This native curiosity is undoubtedly at once nourished by, and also productive of an unusual versatility of intellectual operations and achievements. The Japanese mind is decidedly gifted in adapting itself to changed conditions, and adapting means to ends. This is the truth which underlies the charge so often made in recent times, that the Japanese are «merely imitative» and not «original» or independently inventive. It is scarcely necessary to remark in this connection that the claim to be *original*, in any very strict meaning of that word, cannot be fairly made by any individual or any nation. And, on the other hand, no people have produced a type of race-culture more strongly marked by distinct characteristics, or signalized by individual members of stronger character, than have the Japanese. It is the versatility and adaptability of the intellect of the race, rather than the merely imitative quality of their achievement, which is noteworthy. The notion, therefore, that Japan owes its recent, remarkably rapid progress entirely to its opportunity to borrow what other people had worked out for themselves in an original way, is quite indefensible in the face of historic truth. The whole history of Japan has been marked essentially by the same characteristics. Through all this history, foreign languages and literatures, manufactures and arts, arms and ships and modes of warfare, have been adopted, adapted and improved upon to meet the peculiar requirements and necessities of the national development.

These qualities of intellect result in rather unusual gifts of making a «synthetic seizure,» or picturesque mental presentation of the concrete object, or of some form of statement in which the general principle is embodied or applied. Such is apt to be the character of the work done by the form of imagination that suits best the other characteristics of the sentimental temperament. The Japanese language, which must, of course, be taken as the most immediate and trustworthy expression of the mental characteristics of the people who use the language, has remained, almost down to the present time, in the synthetic stage. It has an enormous variety of verbs, and verbal expressions, for the various modifications of those fundamental forms of activity such as are expressed in English by the words, «to put,» «to go,» «to do,» etc., when followed by different prepositions (a form of speech of which the Japanese language makes comparatively little use, since it has relatively few post-positions). The general form of action has never been analyzed out of its varied forms of application; but each one of these forms has been seized by the mind as a totality and apprehended in this its natural synthesis, so to say. Hence, on the other hand, there is a wonderful power of suggestiveness in single words or phrases; as, for example, when all the longing, love, and sweet sadness of parting from friends is compressed into the word *nagori-oshu*, or when one returns thanks for an invitation to dinner of the day before, by simply saying *sakujitsu* («yesterday»). This concrete and picturesque character of the working of the imagination is both illustrated and intensified by the use of honorifics and of the many periphrases which the recognition of class distinctions and of specialized forms of personal relation has tended both to produce and to enforce. Thus the impression of subtlety, complexity, and indirectness of mental characteristics is renewed and magnified.

It cannot be denied that the excellencies of the intellectual activities which characterize the Japanese have their correlated deficiencies. And these deficiencies are, in the main, just those which customarily belong to the sentimental temperament. Patient, prolonged, and carefully guarded observation of fact, with the judgment held in suspense until it can be tested by a sufficient accumulation of cases or by the well known methods of scientific induction based upon experiment, is neither natural nor easy for this temperament. Truths are discovered or proved, not so much by any strict adherence to logical processes as by a kind of mental seizure which depends upon the working of a lively and picturesque imagination suggesting to the curious intellect an answer to its problem. It is not likely, therefore—as it seems to us—that any similar proportion of minds great in the abstract sciences, or in those branches of learning where broad generalizations are made to repose securely upon foundations of inductive and deductive reasoning, will develop in the near future among the Japanese, as compared with the Germans, the English, the French, or the scholars of the United States. The higher forms of mathematics, logic, physics, chemistry, and even the psychological sciences will probably not receive an accession to their accumulated store of clearly ascertained and defensible principles, corresponding to the amount expended upon education by the New Japan. Still, inasmuch as intellectual curiosity and lively imagination count for much even in these sciences, the laudable ambition and exceptional talents of a few may in time make up for the deficiencies of the many in this regard. And it must not be forgotten that only the few in any race, or under any circumstances, educational and social, are gifted and successful in these higher regions of science. While in the prosecution of those forms of the natural and psychological sciences which depend chiefly upon an eye that is quick to perceive distinctions, and a mind sympathetic and ready as well as acquisitive in the collection of facts, the temperament of the Japanese is likely to be most productive of results to the benefit not only of Japan but of the whole world of science.

The development of philosophy in Japan is characterized by the same temperamental features. It has hitherto taken two principal directions and has been either practical—a philosophy of conduct—or speculative as a semi-

religious and intuitively mystical theory of reality and of human life. The practical philosophy of Japan has derived its inspiration and its form of development chiefly from the Confucian ethics; it has therefore been the guide of notable statesmen and warriors, the doctrine of great teachers (who in Japan as everywhere else in the world, have been the chief influences for moulding the national life and national destiny), and the inspirer of the spirit of Bushidō of the Samurai class, who have been the strength alike of the Old and of the New Japan. The speculative form of philosophy has derived its sources principally from Buddhism. But nowhere else has the stimulus of the Buddhistic view of the world and of human life produced such a variety of more or less harmonious, but also, in their details, conspicuously or subtly conflicting speculations, as among the Japanese. In general these speculations, which are essentially considered different varieties of one kind of philosophy, follow the Indian type. They are poetical, mystical, intuitive, symbolic, and generally vague and inconclusive. They do not, however, anywhere attain the symmetry or proportions of the best examples of the speculative thinking of India. A philosophy that aims to base itself frankly and intelligently upon the particular sciences, and to attain a systematic and scientific whole by the use of logical methods, is neither easy nor congenial for the sentimental temperament. Here again, however, similar considerations of a modifying character are pertinent. Such philosophy is the product of few minds, and is appreciated and understood by only a few, among any race or with any species of race-culture. And philosophizing of the Oriental type, as modified by the mental characteristics of the Japanese, has its own place and value in the development of human reflective thinking.

The race-temperament and mental characteristics of the Japanese have shown themselves most conspicuously, and even resplendently, in two ways: the chivalry of war, and the exquisite sympathy, taste, and skill of art. Brave, proud-spirited, governed by sentiments attached to the forms of action becoming to the class, or rank, and appropriate for personal relations, rather than by considerations of either a utilitarian or strictly ethical character—such has been, in general, the character of the Japanese in war. Even through that unhappy period, during which the feudal lords and military chieftains were occupied with the attempt to exterminate each other, the same character was maintained essentially unchanged. To act as «in honor bound,» whether under the principle of *noblesse oblige,* or under the sense of obligation to render unquestioning service to one's superior, has been the rule of the true-spirited Japanese. And no Christian knighthood in mediæval Europe produced higher examples of devotion to honor and to duty—however mistaken the particular form which this devotion may have taken—than have characterized the entire history of Japan. Indeed, the way in which the spirit of chivalry descended upon all the orders of the people in their conduct of their late war with Russia is one of the marvels of human history.

The artistic temperament of the Japanese, under stimulation and guidance from teachers and examples from China and Corea, and from their own physical environment, has responded with a form of art which, in many of its characteristic features, is unique. The paintings, sculpture, and literature, which were the more direct product of the philosophical and religious conceptions of Buddhism (especially for a thousand years from the 7th century onward) closely resemble, in many of their principal features, the art of mediæval Christian Europe. But it is in their representation of natural objects, or their decorative art when natural objects or suggestions from nature are employed, that the artistic imagination and achievement of the Japanese is most distinctive and most admirable. Here we find a quickness and delicacy of perception, a tenderness and depth of sympathy, a wealth of suggestiveness which knows how to address the appreciative soul without details that obscure and confuse, such as have been nowhere else developed to the same degree. These qualities of Japanese art are the direct result of the race-temperament and mental characteristics of the people, as they have already been described. These aptitudes have not only produced celebrated artists and schools of art, but have also—which is a more difficult and distinctive thing—developed a people penetrated throughout with the appreciation and love of the beautiful, whether as produced by natural forces or by human skill. Emperors, shoguns, warriors, and abbots and monks, write poetry; contests of skill in poetical composition become interesting and exciting court functions; the ceremonials connected with the viewing of the cherry-blossoms or the chrysanthemums, or with the making of tea, are diligently cultivated by the nobility and by the leaders of the nation. On the other hand, peasants, fishermen, and coolies look in an admiring and worshipful way upon what of nature's life-work seems to other peoples trivial and uninteresting; they, too, collect and cherish pretty stones, shells, etc., treat with personal affection flowers, grasses, and shrubs, and take a sentimental pleasure in moon-viewing, in listening to the chirping of the cicada or the *kirigirisu,* and in the beauties of the temple grove or its treasures of brasses, carvings, and kakemonos. A branch just thrown across a misty sky, a bird just alighted upon a lotus-stem and opening its throat for song, a fish swimming against the current, as well as a tiger lapping water from a stream, or engaged in a life-and-death struggle with another tiger, the head of Fuji reflected in Lake Hakone—such are the themes which, with infinite variation in details, inspire both the pictorial and the poetical art of the Japanese. And if the critic is inclined to bring against such work the charge of those weaknesses which are undoubtedly characteristic of the æsthetical products and conceptions of the sentimental temperament, he may be reminded that the strength also of this kind of art consists in just this—its tender and sympathetic appreciation, and suggestive reproduction, of what a coarser taste regards as trivial or indifferent. That the Japanese are capable of historical painting in a spirited and large style, their past endeavors would seem to make clear. And when their pictorial and poetical compositions come again under the inspiring influence

of philosophy and religion, there is good reason to hope that their artistic efforts of the similar *motif* and character will greatly excel those to which Buddhism gave birth. See JAPAN—HISTORY OF JAPANESE ART.

In estimating the moral characteristics of the Japanese it is absolutely essential to determine what we mean by morality. In the comprehensive but strictly appropriate meaning of the word, all races have essentially the same moral character. That is to say, they all have preferred forms of conduct, make value-judgments of the ethical type, are stirred and guided by feelings of obligation, approbation and disapprobation, merit and demerit, in view of different kinds of conduct; and they all hold themselves and others responsible under some theory of a voluntary self-control. As to what particular forms of conduct are preferred, and have attached to them the appropriate feelings, and as to what in action is deemed morally right or morally wrong, although there is really a much more fundamental agreement than is ordinarily supposed, there exists, of course, a great variety both of opinion and of practice.

With this general truth assumed, we may safely declare that the Japanese are as truly moral as any other race of civilized human beings. But the particular form which the moral code and the practice approved by the public conscience have taken has been chiefly shaped by the Confucian ethics, with modifications from the Buddhist religion. As has already been explained, the central principle of this ethics is loyalty—shown, according to the prevalent circumstances and relations, to the Emperor as the civil, military, and religious head of the nation, or to the liege-lord or military chieftan, to the parent, to the clan, to the sworn ally or friend. This principle of loyalty is oftentimes so overpowering in its influence as to obscure the other obligations of a symmetrical moral law, and even to produce startling and almost grotesque effects. For example, while it developed a carefully regulated code of suicide and blood-revenge, it also fostered the unreasonable and insane feeling of obligation to commit hara-kiri for the vindication of one's own honor, or murder in the execution of vengeance upon others. But when inspired by a worthy cause and guided by a due amount of practical wisdom, it has, as has already been said, been productive of a most admirable type, and of many splendid examples of a noble devotion to moral ideals. The less obtrusive, but from the Christian point of view, no less important virtues of pity, kindliness, humility, and resignation, owe their existence and their cultivation, here as everywhere, largely to the influences of religion.

In connection with this explanation of the Japanese type of morals, another consideration is not without importance. This kind of morality is personal, rather than theoretical or legal, in the more restricted meaning of the latter term. But it is also, of course, an affair of custom; hence the right and wrong of conduct is determined, not so much by the application of abstract principles, or of a so-called moral law, with its unconditional imperative and its universal claims, as by resort to the appeal to what is *proper* under different personal relations.

The relative absence of an established code of business morality, and the low condition of business morals, among the Japanese, is frequently remarked; and the fact cannot be denied. It does not, however, show any fundamental deficiency in the moral consciousness of the people, or even any relative inferiority in the average grade of the public morality in general. The deficiency is to be explained as growing out of historical conditions. For in the first place, in the Old Japan men of honor did not engage in business; they did not even in general regard the getting and expenditure of money as a matter that came immediately into touch with their right to consider themselves men of honor. There were, indeed, some honorable men in trade; but the honorable class did not, and could not, engage in trade. Besides, the considerations which influenced all classes in their financial transactions with each other were of the same personal sort, to which reference has frequently been made. Not the keeping of one's word or contract, as such; not the being fair, honest, and truthful with all as a matter of either principle or policy; but the being loyal to the person to whom your loyalty was pledged —this consideration overcame and often extinguished all other considerations. At the present time, a great crowd of untrained and uninformed multitudes, from the lower and the lowest classes, without experience or established moral principles and reputation, have rushed into all the various branches of labor, trade, manufacturing, and other forms of business. If, however, as seems probable, and even fairly certain, the instruction of the Government schools, and the experience of life, are permitted to mould and to guide the inherited temperament and prevalent mental and moral characteristics of the people, the Japanese will succeed in attaining the front rank of honor in the pursuits of peace, as they have certainly already attained that rank in the science and art of war.

As regards their religious nature and development the Japanese do not differ essentially from other peoples of the same grade of raceculture; while their more or less important characteristics of religious belief, sentiment and practice, correspond well to the national type of character. Religious superstitions of all the various kinds have flourished among the ignorant, here as elsewhere; although those of the more dark and cruel kind, such as characterized the Aztecs and much of Northern Europe, and are to-day prevalent in Africa and some of the South Sea Islands, do not appear ever to have taken a similar hold upon the Japanese. The physical horrors of the popular Buddhistic hell have been relatively impotent in Japan, either as inspiration or as restraint. Myth-making and miracle-mongering, such as result from the application of a lively imagination to religious and semi-religious conceptions, are nowhere more abundant. Invisible, divine spirits of all sorts, both good and evil (but chiefly kindly), dwell near to man and are ever ready to enter into personal relations with him. The religion of nature-worship in all its manifold forms and manifestations is inseparably connected with the æsthetical sympathy and artistic appreciation of natural objects and phenomena. While ancestor-worship and hero-

worship both spring from and contribute to those sentiments of loyalty and devotion which are the spiritual impulse and moral principle of what has been noblest in the past life of the nation. When religious belief develops into a monotheistic faith, the conception of God is apt to be clouded by an imperfect apprehension of the nature of Personality and an inadequate estimate of personal values. Thus a tendency to a mystical and vague, rather than a logical or scientific pantheism, controls the thinking and shapes the conclusions of the philosophy of religion, or theology, among the Japanese; and agnosticism or atheism in religion is rather the result of indifference, or of intellectual weariness, or of the affectation of independent and modern views, than of scientific deductions or systematic reflection. When, however, the Being of the World is clearly apprehended as the Ideal of perfect Ethical Spirit, and man's relations to this Being are regarded as best symbolized under such terms, of a personal significance and value, as Lord, Father and Redeemer, the characteristic temperament of this race quite naturally and spontaneously, as it were, produces examples of religious devotion, self-sacrifice and heroism, which have rarely been equalled, and have never been excelled, in the religious history of the race.

We close this sketch of the mental characteristics of the Japanese with the repetition of the statement: that the subject is most complicated and difficult, and that all generalizations must be understood as having the value only of more or less highly probable opinions, and as admitting, of course, of many individual exceptions.

GEORGE TRUMBULL LADD,
Emeritus Professor of Philosophy, Yale University; Lecturer on Education in the universities of Japan.

5. Japan.—History of the Empire. *Introduction.*—The Japanese Empire has been ruled for above 25 centuries (2,567 years) under one unbroken line of sovereigns since the Emperor Jimmu, whose 122d descendant is the present Emperor. The people may be justly proud of their long history, the pages of which have never been polluted by any foreign conquest, and of that matchless continuity of their illustrious rulers, whom they were never tired of revering and loving, even while political supremacy was in subject's hands. Perhaps we may seek the main source of the harmonious unison of ruler and subject in that patriarchal administration adopted by Japanese from the earliest age; and besides, the singularly harmonious temperament of the people and the isolated position of their island in the sea seem to have contributed much towards forming a solid nationality.

Reliable calendars first came into use in Japan early in the middle part of the 7th century of the Christian era, so that the genuineness of dates given by ancient chroniclers to events lying still earlier must be considered doubtful. Modern specialists affect to find a prolongation of 500 to 600 years in that part of Japanese history, and that the Christian era is one century later than the Japanese.

The period prior to the Emperor Jimmu is called «Kamiyo» («Age of Deities»), and is filled with a mixture of legends and mythology relating to deities, regarded as ancestors of the Emperor, and their administration in the country. Among others, «Tenshodaijin» or «Amaterasu-o-mikami» («Deess Shining in Heaven») plays, in this period, the most important role as the lineal ancestress of the Imperial family. Her throne was on «Takama-ga-Hara,» the locality not yet ascertained, and it was she who pronounced that celebrated edict: «The Imperial family shall ever prosper as sure as the heaven and earth,» and bequeathed to her successors the Jewels, Mirror and Sword, venerated as the three sacred insignia of sovereignty.

The historic period may be divided into three great periods: (1) the Age of Imperial Administration; (2) the Age of Military Dictatorship; (3) the Restoration and Constitutional Imperial Administration; and these further sectioned into minor series.

THE AGE OF IMPERIAL ADMINISTRATION.

1. *The First Emperor Jimmu and the Development of the Empire.*—The Emperor Jimmu, the first emperor, valiant and wise, left with his forces the old palace of Hyuga, in the southern part of Kyushu, and settled in Yamato, the central part of Japan. There subduing the aborigines called «Cave-Dwellers» and some nobles who had migrated there from Takama-ga-Hara in a still earlier period, he was crowned as Emperor, and ordained the duties of his subjects of merit and those nobles who became submissive to him, including military affairs, rites, local administration, etc.

Such a distribution of duties was extended even to subaltern subjects, and as the original holder of an office bequeathed it to his son, who again passed it to his son in succession, names of professions in the course of time came to denote families themselves. These families possessed retainers and land property, and titles «Kabane» as Omi, Muraji, etc., varying according to the family dignity, were conferred by the Emperor upon their Headmen. Otomo-no-O-muraji Mononobe-no-O-muraji, Nakatomi-no-O-muraji, Soga-no-O-omi, etc., were the most influential of these titled families. If the need arose these families were to take arms for the Emperor—the very centre round which they were firmly united.

In the reign of the Emperor Sujin (the 10th) four generals were sent in four directions to extend the Imperial authority. A system of taxation was fixed for the first time, industry encouraged, and communication facilitated. Thus under the Emperor, the country made conspicuous progress.

Two rebellious tribes, however, arose in the west and the north, the former with the name of «Kumaso,» and the latter «Yezo,» to subdue which the Emperor Keiko, the grandson of the Emperor Sujin, despatched his son, Yamato-dakeru-no-mikoto. Being completely freed from internal trouble, attention was turned to Corea, whose southern portion was already in Japanese possession. The narrow channel separating Corea and Japan had been crossed constantly since the days of the prehistoric age.

The Empress Jingo, the wife of the 14th emperor, attempted an expedition to Corea, her-

self leading the forces, and succeeding in making nearly the whole of Corea dependent on Japanese authority.

The conquest of Corea had an important significance, not only because of the tribute she annually brought, but because of the liberal introduction of Indian and Chinese civilization, for at that time Corea was far ahead of Japan in culture. A number of Chinese and Coreans were naturalized in Japan and various new arts were cultivated by them. In ancient Japan, the gentlefolk were divided into three classes: (1) those descended from sovereigns; (2) those descended from deities of the prehistoric age; and (3) those descended from naturalized foreigners, as above mentioned.

In the reign of the 29th Emperor, Kimmei, in 552 A. D., the Corean envoy introduced images of Buddha and copies of the Sutras and strongly commended the virtues of that creed. Mononobe and Soga, two influential families who held great political antipathy toward each other, were widely separated in their opinions concerning the new religion, the former against it, and the latter for it. Buddhism, however, having found an able advocate in the renowned Prince Shotoku, the Soga family at last overcame the anti-Buddhist party.

The Prince Shotoku, being charged with the regency of the 33d Empress Suiko, executed reforms in various departments. He laid down, for the first time, a constitution containing the essentials of politics and ethics; introduced the use of the calendar; dedicated to Buddha a number of magnificent temples; and in 607 A. D., the first authorized ambassador was sent to China with the aim of promoting international intercourse. The arts of architecture, sculpture and painting made marked progress with the steadily growing popularity of the new creed, which necessarily led to the construction of many places of worship.

Thus the introduction of Chinese learning and Buddhism was the most significant epoch-making phenomenon in the whole range of Japanese history, and Buddhism left lasting traces in the national customs, disposition, and even in the politics of the nation. In the reign of the 35th Empress, Kogyoku, the loyal Nakatomi-no-Kamatari assisted Prince Naka-no-Oye and succeeded in checking and destroying the arbitrary exercise of power by the Soga family.

2. *The Era of the Taikwa Reformation.*—On the fall of the Soga family, the 36th Emperor Kotoku came to the throne, and with the help of the Heir Apparent, Naka-no-Oye, and acting on the advice of Kamatari and others, inaugurated, in 645 A. D., the famous reforms known in history as the Taikwa Reformation, after the name of the era which was settled upon for the first time.

In that reformation, in order to remove the wide interval between the rich and the poor, all lands and people in the possession of private individuals were confiscated by the state and distributed among the people with certain conditions. The Prince Naka-no-Oye reigned as the Emperor Tenchi, and established, based on the Chinese models, the various laws of punishment, administrative organization, education, conscription, taxation and other civil codes. Afterwards, in 702 A. D., these laws, which go by the name of Taihoryo, were supplemented and revised and were transmitted to posterity for a long period. The Emperor subdued the tribes of Yezo and Shukushin (in Manchuria), so that the Imperial authority was made known even in the modern Hokkaido. Corea, however, which had been the source of many troubles, was abandoned in this reign.

3. *The Nara Epoch.*—We now enter into what is known as the «Nara Epoch,» celebrated for its politics, Buddhism, and arts.

While the 43d Empress Gemmyo reigned, the seat of the Imperial Government, subject till then to frequent removals, was laid at Nara in Yamato (710 A. D.), and the palaces, and city and government buildings were planned to meet that international intercourse which was gradually growing close between Japan and China, the pristine simplicity being found unsuited to the capital.

One of the most noteworthy events in this epoch is the upheaval of the Fujiwara family, descendants of Nakatomi-no-Kamatari, an eminent leader in the Taikwa Reformation. Fubito, his son, also achieved deeds of merit; and Fubito's daughter was the first instance of a subject being raised to Imperial consort. Except a short interruption caused by internal quarrels, the Fujiwara family increased more and more in its authority, until the zenith was reached in the period called the «Heian-cho Epoch.» In that period, the subjugation and cultivation of the Yezo district and the encouragement of agriculture were noteworthy.

In accordance with the provisions of the Taihoryo, a university was established in the capital as well as local schools throughout the provinces, with the aim of training government officials—the subjects chiefly taught being law, history, mathematics and the Chinese philosophy. Hence in that epoch, scholars versed in those lines of learning were very numerous, and it was then that those historical and geographical accounts of Kojiki, Nihon Shoki, and Fudoki were compiled. Many students proceeded to China to finish their education, and some, such as Abeno-Nakamaro, obtained high position in China. Men of that epoch wrote good Japanese poetry, which is still preserved in a collection with the name of Mannyoshu. In that age the Japanese syllabaries, Kata-kana and Hira-kana, were invented to be substituted for the inconvenient Chinese ideographs.

Among the events of the epoch none is more noteworthy than the wide spread of Buddhism. This result may be attributed to the fact that it found many fervent devotees in the Imperial family. The Emperor Shomu built provincial temples (Kokubun-ji) for nuns and priests and endowed them with liberal donations. He moreover had a huge image of Buddha constructed, and put it in a large temple, Todaiji, at Nara, perhaps the largest wooden edifice the world has ever known. Record says that the Emperor Shomu adopted the tonsure and took a Buddhist appellation. The Empress Komyo, his consort, was also zealously devoted to Buddhism and founded a charity-hospital for medical treatment, and measures were taken also for rescuing foundlings. Among many priests of high reputation, Gyogibosatsu is recognized as the most eminent. He and other high priests who

successively rose to fame were not satisfied with the mere preaching of doctrines, but showed great activity in building bridges and roads, and teaching the people to be industrious. There were, of course, priests who abused their religious authority—the destroyer of one of whom was the still celebrated loyal Wake-no-Kiyomaro. Carpenters, from the practice acquired in building temples, learned how to construct large edifices, and the workmanship of the temple idols is wonderful and never fails to dazzle those who visit Todai-ji, Yakushi-ji, and other old temples at Nara. Painting and weaving also made tremendous progress, and the storehouse called Shoso-in, formerly forming part of the Todai-ji and now in the Imperial possession, witnesses how far the civilization in that epoch advanced. It contains things used by the Emperor Shomu, among which are several articles illustrating the intermingling of the culture of India, Western Asia, and even Europe through the Chinese, and contains the census register, the Book of Taxes, etc., as old as 702 A. D. The wooden copies of Sutras, contained in many thousand small pagodas, sculptured by order of the Emperor Shomu, are perhaps the oldest extant samples of wooden printing. While the capital attained a high level in this epoch, it is undeniable that the rest of the country was still in a state of comparative ignorance.

4. *Heian-cho Epoch.*—In the reign of the 50th Emperor, Kwammu, the capital was transferred to Heian-kyo, 794 A. D., perhaps for administrative purposes. It was the modern Kyoto, which is, however, only half the size of the original. There more than 70 emperors reigned for above 1,070 years, until the great Meiji Restoration. The interval which separates 794 A. D. and the year of the establishment of the Kamakura Shogunate, is known in history as the «Heian-cho Epoch.» Another salient event in this reign was the complete subjugation of insurgents in the eastern Yezo districts by sending there Saka-no-uye-no-Tamuramaro.

Several reigns from Kwammu to the Emperor Ninmyo, his grandson, comprise the most prosperous part of the epoch. Learning made a marked advance, and the Emperor Saga is said to have been unique in his penmanship. Besides, many private schools were started by the court nobles.

Buddhism found two more able champions in Saicho (Dengyo Daishi) and Kukai (Kobo Daishi), the former of whom founded Yenryaku-ji on Mt. Hiei, and the latter Kongobu-ji on Mt. Koya. They are said to have taught the identity of the deities of Shintoism, the native religion, with those of Buddhism, which subsequently won the strong devotion of the people of all classes. Buddhism accordingly became the predominating factor in settling all matters relating to political, military and social occurrences. But Shinto shrines, such as Ise or Kamo, always held the people's hearts even in this ascendant age of Buddhism.

5. *The Zenith of the Fujiwara Family.*—The Fujiwara family which sustained a loss of prestige for a time again rose to an eminence when Fuyutsugu was appointed to a vital position called Kurodo-no-Kami. His daughter was elevated to be an Imperial consort, and bore a son, who came to the throne as the 55th Emperor Montoku. With Yoshifusa, son of Fuyutsugu, the Fujiwara family increased its power, for he was the first subject appointed Chief Minister of State, for which office till then none but Imperial princes had been deemed available. Moreover, he was charged with regency over the 56th Emperor Seiwa, his grandson, who was only nine years old when enthroned. Mototsune, his son, was appointed «Kwanbaku,» and after a time the custom of appointing the ex-regent to that position of importance became fixed. It seemed indeed, as though all the highest offices of State had become the exclusive monopoly of this family.

The Emperor Uda, being of a sagacious turn of mind, contrived to put a check on the arbitrary power exercised by the Fujiwara family by bestowing an eminent position on Sugawara-no-Michizane. Michizane's destruction, however, was soon accomplished by Tokihira, a minister of the Fujiwara, and his colleagues in 901 A. D. Thus the invulnerability of this family was once more demonstrated.

Although the next Emperor Daigo was celebrated for his illustrious virtues, and scholars and artists like Ki-no-Tsurayuki, Ki-no-Haseo, Miyoshi Kiyoyuki, Kose-no-Kanaoka, etc., were fostered under that reign, under an appearance of tranquillity and grandeur there lurked elements of effeminacy and corruption. The laws of Taihoryo were gradually being relaxed, and the arbitrary power of the Fujiwara family became uncontrollable.

While enjoying such an arbitrary exercise of power, the Fujiwara family was naturally subject to internal disturbances arising from the selfish ambitions among them. Every prominent member of the family sought to increase his own authority by becoming closely related to the Imperial family. At last, Michinaga (about 1,000 A. D.) became supreme and represented in himself the zenith of that splendid family. His three daughters became the consorts of three successive emperors and he was grandfather of three emperors. A writer depicted the events of these times in a work to which he gave the title «The Annals of Grandeur.»

This epoch was distinguished by great gaiety and splendor. Nobles lived in spacious and grand houses, dressed lavishly, and spent most of their time in reunions of poetry and music, and dilettanteish observation of nature. Japanese poetry, however, made a marked advance. Ki-no-Tsurayuki, by order of Emperor Daigo, compiled the «Kokinshu,» a collection of the best poetry, and this was followed by 20 similar collections. Another noteworthy fact is that national literature began to develop perceptible activity, while the Chinese literature lost much of its sway, owing to the custom of sending ambassadors to China being abandoned. Thus Chinese poetry was supplanted by national verses; and romance, sketches, etc., were written in the national syllabary. Tosa-Nikki, Genji-Monogatari, Makura-no-Soshi were the productions of most renown, and many lady courtiers in the reign of the Emperor Ichijo, and at the time when Michinaga was in power, occupied positions of literary preëminence. In short, while the period of the initiation of Chinese culture was passing, the national literature was steadily growing.

While the nobility in the metropolis were devoting themselves almost entirely to pleasure-seeking, administration in the country districts was entrusted to unprincipled officials. It was an important feature of the Taikwa reforms that all the land in the country became State property, and at the same time was allotted to individuals under certain conditions, which, however, in the course of time, fell into neglect. The rich acquired large tracts; to nobles and temples land property was granted, and moreover, uncultivated lands were suffered to remain in the possession of individuals to get them cultivated. Cunning people evaded the public duties by nominally transferring their lands to nobles and temples, but they themselves acting as stewards. Thus the land of private possession having greatly increased, not only the power of local authority, but also the revenue of the Government gradually diminished, and became one of the chief causes of the decline of Imperial administration.

On the other hand the rise of the military clans is a most noteworthy event in this epoch. During the reigns of the Emperors Kwammu and Saga the plan was introduced, mainly from the financial point of view of reducing some of the Imperial princes to the rank of subjects and giving them family names. Taira (Heishi) and Minamoto (Genji) were the most important instances. Some of these reduced princes acquired large influence in the districts administered by them, and each trained a large body of retainers in the arts of war, availing himself of the inefficiency of the conscript laws of the Taihoryo. Such was the origin of the military clans.

In 939 A. D., a man of the Taira clan, by name Masakado, in the eastern provinces, and Fujiwara-no-Sumitomo of the Fujiwara clan, in the western, rebelled against the Imperial authority, but were immediately defeated. These revolts afforded important occasions for clan ascendency. In 1031 A. D., Yorinobu, a grandson of Tsunemoto, who defeated Sumitomo, achieved success in the Revolt of Tadatsune of the Taira clan, and the two insurrections were quelled respectively by Yoriyoshi, the son, and Yoshiiye, the grandson. Previously, in 1019 A. D., Takaiye of Fujiwara frustrated the invasion of Kyushu by plundering tribes of Toi of Manchuria. His descendants secured a military stronghold in Kyushu. Thus, while the Fujiwara family was rapt in dreams of grandeur, the reins of power came into the hands of the military classes, composed of the clans Minamoto, Taira, and a branch of Fujiwara.

6. *The Age of the ex-Emperors.*—The unbridled omnipotency of the Fujiwara family began to wane in the reign of the 71st Emperor Gosanjo who was sagacious and austere and had no lineal relations with the Fujiwara family. His elaborate scheme of reforms, however, was not realized because of his untimely death. The Emperor Shirakawa, also a man of resolution, interfered with State affairs even after his abdication of the throne in 1086, which was the earliest precedent of that peculiar sort of government called Insei (Ex-Emperor's Administration).

Luxury in dress, magnificence of dwellings and fanatic devotion to Buddhism were the chief features of this epoch. Large temples in the vicinity of Kyoto, such as Yenryaku-ji, Onjo-ji, Kofuku-ji, etc., possessed rich properties, and each maintained thousands of sacerdotal soldiers, who if dissatisfied with any measures of the government, armed with bow and arrow, would make descent on Kyoto in great force to obtain their will. Accordingly, it was always to military men in the provinces that both the Emperor and the Fujiwara family resorted when feuds broke out or the Buddhist soldiers acted lawlessly, and thus the elevation of military men to positions of power was most natural.

The struggle for political preëminence by the Fujiwara family and the long years of moral corruption of the Heian-cho epoch, resulted in a disturbance in 1156 A. D. In that year the 76th Emperor, Konoye, died, and the ex-Emperor Sutoku, seconded by Fujiwara-no-Yorinaga, Minamoto-no-Tameyoshi and others, tried to ascend the throne once more; whereas the Regent Tadamichi, brother of Yorinaga, not being on good terms with his brother, with the help of Kiyomori of the Taira clan, and Yoshitomo, son of Tameyoshi, crowned Goshirakawa Emperor. Thus a bloody war called «Hogen Disturbance» ensued, which ended in the rout of the ex-Emperor. In this way the military classes forced their way into the administrative authority of the State. Three years after the Hogen Disturbance, an insurrection arose, known in history as the «Heiji Disturbance,» in which the power of the Minamoto clan was almost completely broken by the loss of Yoshitomo, its leader, and the Taira clan speedily attained ascendency. The period (1166-1185) is called the Taira Age. Kiyomori, by virtue of his success in the two disturbances, was appointed Chief Minister of the State, and all his kinsmen and followers were given prominent positions, and the reign of the Fujiwara family was practically over.

Arbitrary power, and especially the arrogant attitude of Kiyomori towards the ex-Emperor Goshirakawa, greatly incensed his opponents, and Minamoto-no-Yoritomo, a son of Yoshitomo, and Yoshinaka, his cousin, raised a force of troops in compliance with the mandate of the Prince Mochihito, a son of the ex-Emperor, and after several battles drove out the Taira party from Kyoto. In the tragic sea-battle at Dan-no-ura (1185 A. D.) the Taira clan was completely crushed by the forces of Yoshitsune, Yoritomo's younger brother.

THE AGE OF MILITARY DICTATORSHIP.

1. *The Kamakura Epoch.*—After a decisive battle at Dan-no-ura, Yoritomo was created Grand General of Expedition (Seii-Taishogun), founded the Shogun's government at Kamakura, and the Age of Military Dictatorship of about 700 years begins. Under a pretext of arresting fugitives of the Taira clan, or stray followers of Yoshitsune—his able brother with whom he was on bad terms—and of preventing disturbance in the future, Yoritomo had his relatives and partisans appointed as High Constables in each province and as superintendents of both public land and of nobles' estates, and applied a certain system of taxation on all land property (1185 A. D.). Thus Yoritomo, acting on the sagacious advice of Oye-no-Hiromoto, a man of great statesmanship,

succeeded in becoming the master of the State administration, and while the power of the former provincial governors appointed by the Imperial court and the headmen of nobles' estates gradually lost their authority, these newly appointed military officials steadily grew into what were called «Daimyos,» or feudal lords.

Profiting by the unfortunate precedents of the Fujiwara and Taira families, the mode of life laid down by Yoritomo was simple and frugal. Bravery, honor and loyalty were proclaimed the highest virtues, and if one were found guilty of any serious fault he must atone by suicide. Thus at this period the rules of the Japanese chivalry were clearly prescribed, though the spirit was not new. This soldierly spirit prevailed in literature and amusements, and this warlike age also witnessed the rise of the Zen sect of Buddhism.

The line of Yoritomo came to an end in the third Shogun, and after that the government fell into the hands of the Hojo family to which the Yoritomo's consort belonged, although the nominal Shogun was brought from Kyoto.

In 1221 A. D. the Emperor Gotoba attempted the destruction of the Hojo family, which attempt, however, utterly failed, and the property of those who espoused the Imperial cause was confiscated and divided among the Hojo's followers. Some of the Hojo's family were stationed in Kyoto to restore order, and to act as overseers, and, by the judicious and generous administration of such excellent statesmen as Yasutoki and Tokiyori, that family enjoyed the widest popularity. Yasutoki left a knightly code of 51 articles, which was respected as the basis of laws throughout the military dictatorship up to the Meiji Restoration.

In the reign of the 90th Emperor, Kameyama, when Tokimune, the son of Tokiyori, held regency in Kamakura, Kublai Khan, the Mongolian conqueror, sent envoys to Japan seeking her submission, but his proposals were rejected. In 1281 A. D., the Chinese and the Mongolian forces, above 130,000, together with the Koreans, made an invasion into Kyushu, and were defeated. The period of war and anxiety extended over 30 years, but perseverance and final success made manifest the national spirit of Japan.

Troubles about the succession of Emperors served as an excellent occasion for the Hojo family to obtain paramount power. The 96th Emperor, Godaigo, a daring and wise monarch, lamenting the decay of the Imperial authority, realizing the imbecility of Hojo Takatoki, and relying on the never failing loyalty of Kusunoki Masashige, Nitta Yoshisada, and others, at last succeeded in the restoration of administrative authority to the Imperial House (1333 A. D.).

2. *Revival of the Imperial Power in the Kemmu Era. The Northern and the Southern Courts.*—Ashikaga Takauji, a member of the Minamoto clan, and a man of distinction in the late war, knowing the dissatisfaction of the military classes in the partial distribution of rewards, and the court nobles' prejudice against men of arms, saw an opportunity to raise an independent army. Addressing himself to the newly created Emperor Komyo of the line of the Emperor Gofukakusa, he began a revolt against the Emperor Godaigo, and forced him to seek refuge in the Yoshino-Yama, the celebrated place of cherry-blossoms in the Province of Yamato. For a period of 57 years, dating from 1336 A. D., two lines of Emperors reigned simultaneously, one in Kyoto and the other in Yoshino, and this is therefore termed the age of Northern and Southern Courts. On the death of Kusunoki and Nitta, able defenders of the South, the Ashikaga family rose into supreme power. In 1392 A. D., the two Imperial houses were reconciled and united.

3. *The Muromachi (Ashikaga) Epoch.*—As the Ashikaga family placed the site of their Shogunal government in Kyoto at Muromachi, that period is known as the Muromachi Age. The 3d Shogun, Yoshimitsu asserted his authority by destroying such powerful generals as Ouchi Yoshihiro and Yamana Ujikiyo, who had become insolent by reason of their rich estates. He was also notorious for his love of arbitrary rule and luxury, well exemplified in his sumptuous villa, Kinkaku-ji, at Kyoto.

When Takauji laid his seat in Kyoto, he at the same time sent his second son, Motouji, the uncle of Yoshimitsu, to Kamakura to be governor there; but his descendants growing in power became ambitious, and were finally overthrown. With the fall of the governor at Kamakura, the whole of the Kwanto district was thrown into disturbance.

In the time of Yoshimasa, the 8th Shogun of the Ashikaga line, the disastrous war of Onin broke out (1467 A. D.), occasioned by a succession of troubles in the family of the Shogun and his followers. Hosokawa Katsumoto led one party, and Yamana Sozen the other, and Kyoto was the field of battle for 11 years and was miserably reduced to a state of desolation and ruin. Palaces and temples were burned to the ground with irreparable loss of treasures and documents.

After the war, territorial nobles returned to their castles and would not listen to the central Government. This age of constant contest, extending from the end of the 15th century to that of the 16th, is denominated the «Period of Military Emergency.» Hojo Soun was the most typical hero who attained a position of eminence by the sheer force of sword. In the meanwhile, Uyesugi in Echigo, Takeda in Kai, Imagawa in Suruga, Otomo and Shimazu in Kyushu, Mori in Chugoku, were exercising their respective dictatorships at their own sweet will, until the country was once more united under Oda Nobunaga and Toyotomi Hideyoshi.

During a century of continuous disturbances, literature and the arts sustained little drawback, for learning was conscientiously cultivated by priests of the Zen sect and poetry still continued to be the favorite pastime of court nobles and even of soldiers. In this age, the «Utai» (a dramatic romanza) made a marked development, together with the «No» dance, and nursery tales became a rich branch of literature. The Shogun Yoshimasa retired from the bustle of the disordered society to the picturesque temple Ginkaku-ji at Higashiyama in the vicinity of Kyoto, where he lived indulging in various amusements and especially in the «Cha-no-Yu» (tea ceremonial), and by his refined love of ancient caligraphs, pictures and curios gave a fresh impetus to this brilliant period of Jap-

anese art, which is commonly called the «Higashiyama Period.» Ko-hogen Motonbu, one of the greatest masters of Japanese painting, initiated a new style, uniting the showy native school with simple but high artistic taste of the Sung and Yuan Dynasties of China, and became the founder of the Kano School.

While the peaceful intercourse between Japan and China was maintained by the Shogunate, the people of the littoral districts of Kyushu, Chugoku, and Shikoku, after the repulse of the Mongolian invasion, made frequent raids into China and Korea, which reached a climax in the age of the Military Emergency. In China the name of «Wako» («Japanese raid») was given to these pirates and they were greatly dreaded. For the introduction of the gun by the Portuguese in 1543 A. D., the propagation of Christianity by Xavier, etc., the despatch of ambassadors to the Roman Pope by various magnates of Kyushu, I refer to the article in this series on FOREIGN RELATIONS, by Professor Murakami.

4. *Oda and Toyotomi Period.*—In this state of the local autonomy, Oda Nobunaga greatly distinguished himself and was charged by the 106th Emperor, Ogimachi, with the pacification of the city of Kyoto. As the guardian of the Shogun Yoshiaki, he entered Kyoto, where he repaired the Imperial Palace, restored the poor nobles, and established order. In 1573 A. D. the Ashikaga Shogunate terminated with the expulsion of Yoshiaki by Nobunaga. He subjugated the Takeda clan of the Province of Kai, and was about to start on a campaign against the Mori clan of Chugoku, when he was suddenly attacked and killed by a vassal (1582 A. D.).

Upon Nobunaga's death, Toyotomi Hideyoshi, his tried vassal, afterwards Taiko, perhaps one of the most renowned participators in Japanese history, took his place. He subdued all the important territorial nobles in nine years and the restoration of domestic tranquillity was at last established (1590 A. D.). When the Emperor Goyozei paid a visit to his newly constructed mansion in Kyoto, Hideyoshi settled the Civil List, allotted land property to court nobles, and exacted from all generals an oath that they should reverence the sovereign, and they should not show any disobedience to the «Kwanbaku,» which position he held.

Availing himself of the valiant spirit of those times, Hideyoshi in 1592 made an expedition into «Ming,» via Korea, seemingly to be avenged of the Mongolian invasion in the Kamakura Period. The royal palace of Korea was taken by Japanese forces, and a large body of Chinese reinforcement put to rout. Although the Chinese suggestion of reconciliation was accepted by Hideyoshi, the fraud practised by Chinese envoys put him in such a rage that large forces were immediately mustered for the second invasion, which was frustrated by the death of Hideyoshi (1598 A. D.).

Being fully aware of the smouldering sentiments of hostility, Hideyoshi just before his death entrusted the administration of the State to the hands of Tokugawa Iyeyasu of Yedo (the present Tokyo), who was illustrious for his rank and renown. After the death of Hideyoshi, however, the generals—such as Ishida Mitsunari, Mori, Uyesugi and others—who had served under him, took up arms against Iyeyasu in the cause of Hideyoshi's son, Hideyori. The Tokugawa forces were led by Iyeyasu, assisted by Asano, Kuroda, Kato and others. The opposing armies met on the Sekigahara Plain in Mino, and the Ishida party was utterly defeated, so that the administrative power came wholly into Tokugawa's hands (1600 A. D.).

5. *Yedo (or Tokugawa) Epoch.*—Three years later Tokugawa Iyeyasu was appointed Seii-Taishogun, and founded a Shogunal government in Yedo, which naturally increased in size and grandeur. His administrative supremacy over feudal lords was secured by being generous as well as authoritative. The successor of Hideyoshi, ruling in Osaka, hoped to be restored to the position his father had occupied, and there flocked to his standard many thousands of «Ronins» (unenrolled samurai), but the result was an utter failure. Thus the illustrious house of Toyotomi having been destroyed, the country entered upon a long era of peace.

The measures contained in Iyeyasu's laws for territorial government were of the most prudent nature. To avoid the excessive autonomy of territorial nobles, every feudal lord was required to live every alternate year in Yedo; the construction of castles was placed under strict limitations and by means of a careful territorial distribution, nobles were prevented from forming allies. He knew how to give allegiance to the Imperial family, without surrendering any actual authority. The encouragement of learning and refined manners resulted in obliterating the cruel and rude customs of the people.

Believing it for Japan's commercial advantage that friendly intercourse should exist with Korea, peaceful relations were resumed, and it became a custom to have an embassy of congratulation sent from Korea on the occasion of the succession of a new Shogun. Under Iyemitsu, the 3d Shogun, a man of extraordinary ability, the organization of the Shogunal government was greatly perfected, and the supremacy of the Shogun was conspicuously enhanced. At this time the Government rigorously persecuted the Jesuits and their followers as dangerout to the welfare of the country, and Christian converts fled to Shimabara, where their headquarters was at last subdued, in 1638 A. D. It is believed that some of those defeated at Sekigahara sided with the Christians to be revenged on the Tokugawa. Fearing the spread of Christianity, strict laws were enacted for the prohibition of foreign communication, and no foreign vessels were permitted to enter except those of Korea, China and Holland.

About two centuries and a half, from 1615 A. D., the year of the fall of Toyotomi, down to the Meiji Restoration, was a period of tranquillity, broken only once by Christian insurrection, and in it culture made wonderful progress, and the war spirit perceptibly diminished. During the celebrated era of Genroku (1680-1709 A. D.) when the 5th Shogun, Tsunayoshi, ruled, the highest seat of education was established by the Shogun's order, and the grandson of the celebrated scholar Hayashi Doshun appointed its president. This encouragement of education was imitated by the feudal nobles, who also established schools in their respective provinces,

SCENE ON THE BAY OF YEDDO, JULY 11, 1853.

and vied with each other in getting men of learning. The most distinguished of these savants were Ogiu Sorai, Ito Jinsai, and Arai Hakuseki. In that period the «No» dance, «Joruri» music, and the dramatic play enjoyed wide popularity, and costumes and furnitures were of the most luxurious nature. It was at this time that the famous vendetta of 47 Ronins took place (1702 A. D.).

The empire being thus busily engaged in the cultivation of learning and arts, the administration of the Shogunate was characterized by inaction, and the military equipment began to be neglected. The 8th Shogun, Yoshimune (1716-1745 A. D.), on assuming administrative control, set himself to reorganize the Government by introducing the Kyoho reforms. He retrieved the poverty of the whole country by the enforcement of frugality and economy, and fostered the popular taste for martial exercise. He collected also a volume of laws, called «Hyakka-jo,» commended the Dutch learning introduced by Aoki Konyo, and encouraged industry. On the death of the Shogun Yoshimune, the political adjustment relaxed. Matsudaira Sadanobu then became the chief minister and set himself to enforce the Kwansei era reforms. Then succeeded the exceptionally prosperous eras of Bunka and Bunsei (1804-1829 A. D.), during which many evil practices crept in, but a great reform took place under Midzuno Tadakuni, in the era of Tempo (1841 A. D.).

In 1853 A. D., Commodore Perry came to Japan with his fleet. Several years before his arrival, both Russia and England had sought permission of the Government to carry on trade, but without avail. As the result of various encroachments of the Russians, and the disorderly conduct of Englishmen at Nagasaki, careful measures were taken for littoral defence, and the government ordered that any foreign ship approaching the coast should be fired on. Among the Japanese, however, many who had acquired the Dutch learning spoke against such a violent policy.

On the other hand the cry of «Loyalty to the Throne» became more and more fervent, for the people had learned how the military families of successive generations asserted their own authority at the expense of that of the Imperial House. The history of the past was widely studied in such a painstaking work as 'Dainihonshi' (History of Japan) compiled by Mitsukuni of Mito and his retainers. The studies of national literature, pioneered by a learned group of men, headed by Kamo-no-Mabuchi, Moto-ori Norinaga, etc., naturally stirred up still more the people's love for the Emperor.

The Shogun's government, though traditionally accustomed to the arbitrary exercise of power, was now perplexed, both by the Imperial court and the popular cry, and the necessity of coming to some terms with America and other foreign powers was felt. Moreover, the Shogunate was disturbed by an internal trouble about the succession. At this crisis, the courageous Ii Naosuke (Kamon-no-kami) was appointed Tairo, (Prime Minister), and, in 1858 A. D., a temporary treaty was signed with five countries—America, England, France, Russia and Holland, and the succession problem was also settled.

The blame for having taken an audacious step of concluding a treaty without the Imperial sanction was directed at Ii, who, however, resolved to settle the disturbance by dismissing, sending into exile or to death all opponents of his policy. Amidst such a hue and cry, Ii was attacked and killed by the Mito Ronins, and the authority of the Shogunate rapidly diminished. The Mori clan of Choshu united with the Shimazu clan of Satsuma with a common view of destroying the Shogunate Government. Finding himself confronted by such difficulties, Yoshinobu, the 15th and the last Shogun of the Tokugawa, acting on the advice of Yamanouchi of Tosa, resigned the office of Shogun, and restored the administrative power to the Imperial Court in October, 1867, A. D. Thus the Tokugawa Shogunate ended with a brilliant history of 265 years, and the Age of the Military Dictatorship for 682 years came to an end.

RESTORATION AND CONSTITUTIONAL IMPERIAL ADMINISTRATION.

Subsequent to the restoration of the administrative authority and the overthrow of the Tokugawa Shogunate, the Shogun's household troops and some of the territorial nobles, owing to their dissatisfaction with the attitude of the Choshu and Satsuma clans, attempted revolts, all of which, however, were defeated.

In the first year of the Meiji era, that is the year next to the Restoration, the present Emperor issued a declaration emphasizing the fundamental essentials of his administration, as, for instance, that the management of the State should conform to the public opinion; that rulers and subjects should be united for the development of the nation; that the knowledge of the world should be sought in order to make firmer the Empire's foundation. In the 2d of the Meiji, the capital was transferred from Kyoto to Tokyo.

Even after the Restoration, the unification of the national administration was found impossible, for the land and the people were still in the possession of feudal lords. The four powerful clans of Satsuma, Hizen, Tosa, and Choshu, therefore, addressed to the sovereign a letter declaring their desire to restore their land and retainers to the Emperor, and all other nobles followed the same course. Then the «Han» (fiefs) numbering above 300, were replaced by «Fu» and «Ken» (prefectures), and governors to administrate them were appointed. Thus the Emperor came into full control of the land and people which had long been under the sway of territorial nobles.

Among various minor reforms, the distinctions of Kuge (court nobles), Daimyo (feudal nobles), Shi-No-Ko-Sho (samurai, peasant, artisan, and merchant) were abolished, and the people were divided into the three ranks of Kwa-zoku, Shi-zoku and Hei-min. The cue and swords of men were discarded, and the lunar calendar was replaced by the solar. A new law of conscription was issued declaring every man to be a soldier, and many codes of laws were enacted.

The Emperor also encouraged education by giving special attention to it, and the Imperial Rescript was announced to settle the funda-

mental basis of education. At present, there are numerous educational establishments, including universities, colleges, middle and common schools, etc. Railways, post, telegraph, and mail steamers were provided for facilitating communication. Though some conservatives were opposed to the introduction of Occidentalism, foreign civilization advanced with irresistible speed and energy, which advance, however, was happily modified by a strong national sentiment.

In 1875 a senate was organized for legislative purposes, and the assembling of local governors prepared the way for representative government. In 1889 the Constitution was promulgated amidst universal congratulation, and in the following year the first session of the Imperial Diet took place. Thus the constitutional imperial government of the nation was firmly established.

Since the first treaties were concluded with foreign nations. Japan has constantly been beset with international difficulties. Soon after the Restoration, an envoy was sent to Korea with renewed expressions of friendship, which action, however, met with an insolent reception. Incensed by several other insulting acts, Saigo Takamori and his followers insisted on the necessity for war. Another party headed by Iwakura Tomomi and Okubo Toshimichi opposed this view and defeated the advocates of recourse to arms. Thus a rupture took place in the cabinet and a civil war ensued. Though Korea afterwards entered into friendly relations with Japan, there were two parties in the country, one favoring Japan and the other favoring China, which condition often threatened serious complications. The Chinese attitude towards Korea—looking upon the country as Chinese territory—gave occasion for the Chino-Japanese War (1894-1895); and the failure of Japan and Russia to agree concerning their rights in Korea and Manchuria, resulted in the Russo-Japanese War (1904-1905).

The details of these recent wars, with those of other reforms since the Restoration, are treated in separate articles in this department, to which the reader is referred for additional information.

SANJI MIKAMI,
Professor of History in the Imperial University, Tokyo.

6. Japan—The Japanese Constitutional Government. Among the jurists of Europe and America, it had heretofore been considered that constitutional government is only compatible with the social and political status of the Western nations, and furthermore that Oriental nations could never adopt this form of government, because they have no common ground upon which constitutional government could be planted; therefore when, in the year 1881, the Emperor of Japan announced, by the Imperial Edict, that constitutional government should be established at the end of ten years, the peoples of Europe and America thought that he had adopted a mistaken policy.

But the year 1890 came, and the first Parliament was convened in accordance with the Constitution which was promulgated the year before; and has continued ever since, Parliament having just completed its 23d session in the 18 years. Thus constitutional government in Japan, in spite of many boisterous meetings and much sensational discussion, which are by no means uncommon in Europe and America, must be considered a success.

In order to explain why Japan, one of the Oriental nations, has succeeded in adopting the system of constitutional government, it is necessary to review some of the important facts connected with constitutional movements in Japan during the last 40 years.

On his ascension to the throne after the Imperial Restoration in 1868, His Imperial Majesty proclaimed the five articles of the Imperial oath, one of which marked out distinctly the future course of His Imperial Government, in the following words: «We shall henceforth seek knowledge and wisdom in an outside world and establish the National Assembly, where the important affairs of State shall be decided by public opinion.»

This is the fundamental principle of Japanese national policy, by which all the subsequent changes and reorganization, both political and social, were carried out and consummated. In 1875, the judiciary system was organized by establishing the Court of Cassation, to maintain the unity for the execution of the law, although there were already the District Court, the Provincial Court, and the Court of Appeals, but there was no Supreme Court where all the judicial matters in the Empire could be decided and unified. In the same year the Senate was established by the Imperial Decree, which clearly stated that in future all important legislative bills be brought by the Cabinet and discussed before the Senate. The changes placed the Japanese Government on the same organization as Europe and America—under the three branches of the Executive, Legislative, and Judicial. This might be called the first step in the Central Government to pave the way for constitutionalism in the future.

Now, let us turn to the reorganization of provincial affairs. In 1879, the law was passed in the Senate establishing a Provincial Assembly in all the provinces of the Empire. To this Assembly all the taxpayers send their representatives by election, and the Governors of the Provinces bring the annual estimates, which are discussed and voted upon by its members. Here we find again a system of self-government in local affairs, like that in Europe and America.

As soon as the people acquired the right to discuss and vote upon the provincial expenditures, they naturally desired to have the Parliament opened, where they might discuss and vote upon the national expenditures, in the same way as in the Provincial Assembly. This was urgently demanded by the political leaders outside of the Government, as the only means to interest the people in the welfare of the country, and they still further insisted that this was the principle of the Imperial oath of 1868. The public speeches and newspaper discussions on the question intensified the demands of the people, which had grown so strong as to compel the Government to adopt a policy to open the Parliament much sooner than had been intended, and the famous Imperial Proclamation of 1881 was issued, by which the Emperor declared a first Parliament

AMERICAN SAILORS IN THE TEMPLE GROUNDS, SIMODA, JULY 8, 1854.

to be opened in 1890. Thereupon the Emperor appointed Marquis Ito to go abroad on a mission to study the constitutions of Europe and entrusted him with the important work of drawing up the draft of a constitution. In 1884, after four years of close investigation of the European constitutions, he returned to Japan, and soon the committee was appointed to prepare the draft under the guidance of Marquis Ito. This committee consisted of Viscount Inouye (deceased), Baron Ito and the present writer.

During the five years from 1884 and 1885, Marquis Ito had personally directed the work of the committee and drawn up the draft, which was submitted to the Emperor for his approval. In the spring of 1888 the Emperor organized the Privy Council, and opened the meetings to deliberate upon the draft of the Constitution. The first meeting was held in May, and continued until January 1889, and was presided over by His Imperial Majesty in person, who attended every session of the council. After a close deliberation of nine months, the Constitution was promulgated by the Emperor in person 11 Feb. 1889, with solemn and gorgeous ceremony, in the throne room of the Imperial Palace, attended by the Imperial families, Ministers of State, Privy Councillors, Foreign Diplomatic Corps, all high officials, and Governors and Representatives of Provinces, and its proclamation was followed by national rejoicings and festivities.

Thus the movement for constitutional government in Japan began at first with the Imperial oath of 1868, and was continued in remodelling a political mechanism for a long duration of 23 years, and finally completed by separating the Government into the three branches of Executive, Legislative, and Judiciary, which are acknowledged principles of constitutional government in Europe and America.

But there is an important difference between the constitutions of the western nations and that of Japan. The constitutions of England and the continent of Europe are really the outcome of a popular uprising against the tyranny of rulers; in other words, constitutional government was demanded and established as the natural right of the people. Consequently even the constitutions of monarchial Europe were drawn up in such a way as to put the greatest stress and importance upon the popular right, and at the same time, the power of the sovereign was curtailed as much as possible. The constitutional history of Europe and America is a protest against the encroachment of the sovereign upon popular rights; but the Japanese Constitution emanated from the Emperor—fountain of power—and not from the popular right, as clearly stated in the Imperial oath. Before the people ever dreamt of a popular right or a Parliament, the Emperor had already marked out the policy of constitutional government in future, because his ardent desire was to elevate his country so as to enable it to take rank among the civilized nations of the West; and this is not only his wish, but is in strict accordance with a national policy bequeathed by his Imperial ancestors.

Following this national policy, the Constitution was drawn up with strict adherence to, and in preservation of, the traditional history of Japan and the fundamental principle of the Imperial government for 2,500 years. However, the form of the Japanese Constitution is practically the same as those of Europe and America; but with this difference, that the texts of the Japanese Constitution only contain the fundamental principle of State; that is to say, the Prerogative of Emperor, Rights and Duties of People, Powers of Parliament, Powers and Duties of Ministers of State and Privy Councillors, and Judiciary and Finance. All these are embodied only in the 76 Articles of the Constitution.

Here we naturally meet a question—how can the national affairs be administered under only 76 articles? When, however, we examine the Japanese Constitution minutely, we find that it was drawn up so as to separate as many articles as relate to «Rules and Proceedings of Parliament,» «The Laws of the Election of Members of Parliament,» and «The National Budget,» and these are embodied in the supplementary laws of the Constitution, and enacted at the same time. Why was such a separation necessary? Because when a first Parliament is opened, the Government as well as the members, in discussing national affairs, might find it necessary to make some changes in the articles therein. If such a change affect the text in the Constitution, it might afford a good opportunity for some unscrupulous politician to try to change the fundamental principle, and even if he failed in his attempt, it could certainly lessen the weight of the Constitution, but if these articles are separated from the constitutional text, then they can be easily changed and amended so as to meet any need.

This is particularly so in regard to «The Law of the Election of Members to the Parliament,» because the qualifications of members and many details connected with the election must be modified from time to time so as to meet the future requirements of the progress of people and the change of national conditions; as was done in 1900 when the law was modified to meet the requirements in regard to the qualifications of electors and candidates.

The Japanese Constitution is divided into seven chapters, comprehending 76 articles.

Chapter I relates to the Emperor; Chapter II to the Rights and Duties of the Subjects; Chapter III to the Imperial Parliament; Chapter IV to the Minister of State and Privy Council; Chapter V to the Judicature; Chapter VI to the Finances; Chapter VII to the Supplementary Rules.

Chapter I relates to the Imperial sovereignty. The present Emperor of Japan is the direct descendant of the first Emperor Gimmu, who, after having conquered all the tribes, became the sole ruler of the nation in the year 660 B.C. During a period of more than 25 centuries, one unbroken line of emperors has succeeded to the imperial power, a unique exception in the history of monarchies. This fact was strongly emphasized in Article I by stating that «the Empire of Japan shall be reigned over and governed by a line of emperors unbroken for ages eternal.»

Under this chapter the royal prerogatives

are summarized as concisely as possible in a few articles, yet conceding all the ancient rights and powers of the Emperor which had been so long in the hands of the Japanese sovereign. In regard to the royal prerogative, European countries have enumerated in their constitutions all the rights and powers of the sovereign so fully that they have greatly handicapped the royal will; but the Emperor of Japan, so long as he does not interfere with the Constitution, can exercise his ancient right to the full. According to the Constitution, the three powers of state, the Legislative, Executive, and Judicial, are invested in the person of the Emperor, who is the life and centre of the whole political mechanism. Japan, by the method she pursues in connection with her sovereign, gets rid of the idea once prevalent in the 18th century, that legislative, executive, and judicial powers should be independent of one another.

Chapter II deals with the rights and duties of the Japanese subject in conformity with European system. When feudalism held sway in Japan, the people were divided into four distinct classes: the military, the farming, the artisan, and the merchant. Civil and political rights were enjoyed only by the military, but at the imperial restoration, in 1868, class distinction in politics was abolished; and by the new Constistution civil preference has likewise been put aside. Each Japanese subject, therefore, in his political and civil rights, is now on an equal footing with his neighbor. Moreover, he has acquired the freedom of speech and writing together with that of publication, and the privilege of holding and attending public meetings and forming associations; liberty to choose a place of residence; and, finally, he is granted the freedom of religious belief and worship. Nor can a Japanese be arrested, detained, tried, or punished except according to law; nor can a dwelling be entered or searched without a magistrate's warrant. The right of property and the privacy of correspondence are considered inviolable except by a provision of law. Each subject has an equal eligibility for civil or military appointments, and for any other public office; and no preference is given to family or order. The right of petition, which in an early period of their constitutionalism was so much sought after by the Anglo-Saxons, and won at last after fierce opposition, was granted to Japanese subjects as a free gift of the Emperor.

In Chapter III the organization of Parliament is divided into, first, the House of Peers, and, second, the House of Representatives. The organization of the two Houses is not mentioned in the Constitution, but is left to ordinary laws, in order to meet the requirements of time, and to be modified accordingly. Qualification and the electorate, too, must vary with social and political progress; but the Constitution itself cannot be changed like ordinary laws.

The parliamentary organization greatly resembles that of England, but its power is more limited. If we compare the Japanese Parliament with that of England and with the Congress of the United States, we see a greater resemblance to the American Congress than to the English Parliament; for the latter has almost the sole right of sovereignty and can wellnigh act as it pleases, and even change the Constitution itself; while the former must obey the provisions of the Constitution, and can do nothing outside of the power already sanctioned thereby. There is, however, a striking difference between the Japanese and the American constitutions, for in the United States the Constitution proceeds from the people; in Japan from the Emperor. Therefore the Japanese Parliament may be styled a non-sovereign, legistro-financial assembly, for it is convened by the Emperor to deliberate upon questions of law and the national budget. If we compare the constitutions of three countries, namely, England, the United States, and Japan, we have a marked dissimilarity: in England the sovereign power rests with Parliament; in the United States with the people; and in Japan with the Emperor. Here we have an excellent specimen of three constitutional forms of government. The first we may call a constitutional parliamentary government, the second a constitutional democracy, and the third a constitutional monarchy.

The Japanese Parliament has many powers, which are enumerated in the Constitution, but if we take the more important ones, they are four in number. The first is to deliberate upon and discuss points of law brought either by the government or by its own members; the second, to examine and vote upon the national budget; the third, to receive petitions from the people, and to question the government upon any matter relating thereto; and the fourth, to present an address to the Emperor upon grave questions of national affairs, or to report to him upon the condition of ministerial confidence.

Chapter IV relates to the ministers of state and privy councillors. There is, possibly, no question of constitutional law further from solution than that dealing with the responsibility of ministers—and to what extent their responsibility reaches, and to whom the ministers are really responsible.

In almost every country governed by a constitution it is acknowledged by custom or usage that the ministers are responsible to the Parliament for the management of national affairs, and by this means the Parliament has already gained the whole power of sovereignty, or is endeavoring to gain it at the expense of ministerial stability.

From this article we infer that the Japanese ministers are responsible only to the Emperor—not to the Parliament—for the management of national affairs; and ministerial responsibility arises simply from the the advice they have given to their sovereign as councillors. But when we examine their position towards the Parliament from a practical point of view, we find the ministers with a twofold responsibility, —one direct, to the Emperor, and the other indirect, to the Parliament. Notwithstanding the fact that the ministers of state are appointed by the sovereign personally, and their official position is entirely dependent upon the royal pleasure, Parliament, by means of an address to the Emperor, controls the conduct of ministers in regard to national policies. This indirect responsibility comes from the position of the ministers towards the Parliament in relation to questions of law and the national budget.

The Privy Council is the supreme deliberative body attached to the sovereign, whom it advises whenever it is consulted upon important questions of national policy. Its function is, first, to decide disputes arising from the interpretation of the Constitution, or the quasi-constitutional laws, such as the Law of the Houses, the Election Law, the Law of Finance, and the like, or disputes in regard to the budget or other financial measures; and, second, to deliberate upon amendments to the Constitution, or amendments to the quasi-constitutional laws. Thus the Constitution creates the two media in the system of government through which the national affairs are managed: the one, the ministers of state, who guide the national policy and transact all the administrations of government; and the other, the Privy Council, which advises the sovereign whenever he consults with that body.

We now come to Chapter V. According to the system which prevailed in Japan during the time of feudalism, the department of justice was under the control of the State, and judges were dependent upon the minister of justice. But as the influence of the military class under the feudal system increased, all the political powers passed into their hands, and consequently judicial power was under the guidance of the chief of police, and so continued till the time of the imperial restoration, in 1868. Immediately after, however, the judicial authority was centered in the Emperor. Thus the Japanese fully recognized the legal maxim that the sovereign is the fountain of justice, and that all judgments should be pronounced in his name; and this recognition is clearly stated in Article 57 of the Constitution, which says that «the judicature shall be exercised by the courts of law, according to law, in the name of the Emperor.»

The judicial organization of Japan is much the same as that of the Western nations, for the court is divided into the following classes, namely: first, the District Court; second, the Provincial Court; third, the Court of Appeals; and fourth, the Court of Cassation. The judges are appointed by the Emperor; but he can select only those who possess the proper qualifications according to the provisions of law. In order that a trial may be conducted with justice and impartiality, the judges are appointed for life, independent of dismissal either by the Emperor or by the Parliament, and they can be discharged from their office only by a sentence passed by the criminal court, or upon the disciplinary trial, whose rules and proceedings are to be decided by law.

Chapter VI deals with finance. The Constitution attaches great importance to financial affairs, for it has made many improvements on European systems which have been the result of the keen observation of the most practical financiers. For instance, the national budget is first presented to the House of Representatives in a form similar to that of most constitutional countries in Europe; but the House of Peers has the same right to examine it and vote upon it as the Lower House; and by these means, while giving the Upper House more power than a mere adoption or rejection of the budget *in banc*, it restricts the absolute power of the House of Representatives over the annual budget. In this respect, the Japanese Constitution more resembles that of the United States than that of Great Britain. A careful investigation of the English parliamentary control over the national budget has shown that there was a time when that Constitution allowed the same right to the House of Lords as to the House of Commons; but in the course of years, the latter gradually gained a full sway over the question of national finance. Yet since the peers pay as heavy taxes to the treasury as the commons, they should not be deprived of the right to vote on this question. This is one of those anomalies of the English Constitution which can be explained only by its peculiar history and tradition. Therefore it is unnecessary to follow the example of Great Britain in a new country like Japan, as she has her peculiar history and a different condition of national finance.

Another instance of divergence is that of the expenditure, which, according to the Constitution, is divided into two classes, the immovable and the movable. In regard to the immovable, Article 67 states that «those already fixed expenditures, based by the Constitution upon the powers appertaining to the Emperor, and such expenditures as may have arisen by the effect of law, or that appertain to the legal obligations of the government, shall be neither rejected or reduced by the Imperial Parliament without the concurrence of the government.» Under this head are included the civil list, ordinary expenses required by the organization of different branches of the administration, and by that of the army and navy, the salaries of all civil and military officers, and outlays that may be required in consequence of treaties concluded with foreign nations; the expense of the House of Parliament, annual and other miscellaneous allowances to the members, government pensions and annuities, the interest on the national debt, redemption of the same, and other outlays of a like nature. These expenditures are fixed by the Constitution, which, being the highest and the fundamental law of the country, cannot be changed by any process of ordinary legislation. Thus all those expenditures which are necessary for the existence and continuance of the national government are secure from reduction or rejection by either House. This provision may be compared with those regulations relating to the English Consolidated Fund; and a similar protective clause has recently been made in several German states, namely, Brunswick, Oldenberg, Hanover, and Saxe-Meiningen.

The movable expenditures, consisting of all those items exclusive of the immovable expenditures which are either casual or temporary in their nature, are annually brought before the Parliament for discussion and approval.

Our last chapter is devoted to the supplementary rules, and has special reference to the amendment of the Constitution, which can be made only by the Emperor.

By the adoption of the constitutional government, Japan has shown to the whole world that she is following in the steps of the civilized nations, and the record of the last 18 years of her Parliament has shown to Europe and America that Japan has mastered the most intricate mechanism of constitutional government.

And again by adopting the constitutional government, Japan not only entered into the family of civilized nations, but has shown to the world that the constitutional government is not monopolized by the Caucasian race. Moreover, Japan by her earnest study of 19th century science, by her keen appreciation of the fruit of civilization, and by her strong perception of national responsibility, has entered into the arena of Constitutional Government and mastered thoroughly the same principle acknowledged in the civilized nations of Europe and America.

BARON KENTARO KANEKO,
Privy Councillor, Tokyo.

7. Japan—Foreign Relations. The first foreign relations of Japan were, as might be expected from the geographical position of the islands, with the peninsula of Korea. The dividing strait with the islands of Iki and Tsushima situated, like stepping stones, at convenient distances, can not have been very difficult to cross even in primitive boats. We accordingly notice that there existed from the earliest times close relations between these two countries, and in the beginning of the Christian era Japan was exercising a sort of protection over the Kingdom of Nimana. The kings of Silla, on the other hand, had so much influence over the tribes in the south of Japan as to instigate them to revolt against the central government. Continuous troubles caused by them induced the Empress Jingo to set out on an expedition to Korea. This invasion, however, was so unexpected that when the Japanese army landed on the coast of Silla, 200 A. D., the King asked for peace without offering the least resistance. The kings of Kulei and Paikchyoi soon followed his example, and the three kingdoms of Korea became vassal states of Japan. They promised to pay annual tributes and the Japanese Resident at Nimana was entrusted with their supervision. They, however, very often failed to keep their promise, and had to be as often chastised. They, moreover, waged frequent wars against one another, and Japan had always to interfere in the interest of the weaker state. Many Residents, too, taking advantage of the great distance from home, attempted to make themselves independent, and armies had to be sent to punish them. Thus the dominion over Korea was the cause of endless trouble to Japan.

In 562 Silla conquered Nimana and did away with the Japanese government which had existed there for about five centuries. Silla grew further in power, and allying herself with the new risen Tang rulers of China conquered Paikchyoi in 662, and Kulei in 668. Japan's attempt to check the progress of the allies was of no avail and her influence in the peninsula came to an end.

The intercourse with Korea, however, was not wholly stopped. Silla sent embassies, although with frequent interruptions and often in hostile attitude, and when the new Kingdom of Pohai arose in the 8th century, her embassies came very often, so that there used to be interpreters for their language in Echizen, and those for that of Silla in Tsushima. When in the 10th century Silla was overthrown and the later Kingdom of Kulei arose, the official relations with Japan were stopped, but commerce went on as before.

The intercourse with Korea was highly beneficial to Japan. Korean weavers, embroiderers, potters, blacksmiths, shipwrights and other artisans were encouraged to establish their industries in Japan. Physicians, astronomers and painters were also invited. The study of Chinese literature was introduced by two Korean scholars, Achiki and Wani, in the latter part of the 3d century and thus the way was opened for the adoption of Chinese characters. In 552 the King of Paikchyoi presented to the Emperor of Japan an image of Buddha and a copy of the sutras. Notwithstanding the strong opposition on the part of many influential adherents to the national worship, Buddhism gained ground steadily. In the train of the new religion came priests, temple architects, sculptors, painters, musicians, etc. These, together with Korean emigrants, who settled in large numbers in different parts of Japan, helped to give a great impulse to the progress of arts and industries.

The Japanese seem to have come into contact with the Chinese for the first time in Korea, where numbers took refuge from the terrors of constant wars in their own country. Later on, some of these, like the Hadas and the Ayas, settled with all their families in Japan.

In those times merchants from different parts of Japan were accustomed to go to China via Korea. In the beginning of the 4th century the Court sent an envoy to Wu with the object of engaging weavers. Afterwards embassies were sent from time to time during the rule of the Sui and the Tang dynasties, the first embassy to the Court of Sui leaving Japan in 606. These embassies were accompanied by a large number of priests and students. These latter came back after a stay of some years full of new ideas. They helped to reorganize the government and make new laws, and introduced improvements in social organizations. They gave a new stimulus to the study of the Chinese classics and thus prepared the way for the growth of the national literature. Two forms of syllabics—*kata-kana* and *hira-kana*—were both their inventions. They brought back with them such useful plants as tea, cotton and orange, and also helped to bring about the progress of arts and industries. In short, they played a very important part in introducing the Chinese civilization.

These embassies had to be stopped at the end of the 9th century, when the power of the Tang emperors became very weak and China was plunged in a frightful state of wars. They were not renewed when the Sui dynasty came to reign, but Japanese priests still continued to visit China, and commerce was even more active than before. The Japanese authorities encouraged the coming of Chinese vessels by opening new ports in the interior, and conferring special honors upon Chinese merchants.

When the Mongol-Tartars overthrew the Sung emperors, and the new dynasty of Yuen began to reign, the great emperor, Kublai Khan, conceived the idea of annexing Japan, and sent in 1268 an envoy demanding immediate submission. This and other embassies were

sent back without any reply. The Khan, enraged at this slight, sent a fleet of 450 vessels against the island empire. In 1274 the fleet proceeded to the western coast of Kyushu, after ravaging the islands of Tsushima and Iki. The Japanese army made a stout defence and kept the enemy from landing for more than a month, when a violent storm destroyed many of the invading vessels and the remnant sailed away secretly by night. This disaster only helped to enrage the Khan still more, and when his envoys were put to death in 1279 by the order of Hojo-Tokimune, he fitted a large fleet of 4,000 vessels with 100,000 soldiers and 10,000 Korean contingents. All this time Japan was not idle. The western coast of Kyushu was strongly fortified, and soldiers flocked there from all parts of Japan to defend their country. The immense fleet came in 1281, and began to attack the forts at once. The Japanese suffered very much from the enemy's guns, but they were able to prevent the landing of the enemy for more than two months. The number, however, might have finally told, when for the second time the elements came to Japan's help. On the 16th of August, 1281, a typhoon attacked the coast and shattered the whole fleet of the Mongols; a few thousand survivors took refuge on a neighboring island, but were either killed or taken prisoners. It is said that out of the whole army only three were able to escape alive. Such was the end of the grand fleet of the mighty Khan. Japan might well be proud of her stout resistance, and rejoice over her miraculous deliverance.

After this defeat Yuen emperors relinquished forever the conquest of Japan and even became friendly. Commercial relations were re-established, and in the middle of the 14th century we find semi-official Japanese vessels going annually to China—the so-called Tenryuji vessels, the proceeds of whose commerce were to be used for the benefit of the temple.

At the end of the 14th century, Choo-Yuen-Chang, the founder of the Ming dynasty, after expelling the Mongol invaders, sent an embassy to demand that Japan acknowledge China's sovereignty, but the Japanese government angrily refused to do so. The Chinese emperor, however, thought better of it, and made it a policy of his house never to attempt the conquest of the islands. In the 15th century the Ashikaga shoguns sent frequent embassies to the court of the Ming sovereigns, and commerce was very flourishing. Hakata, Hyogo and Sakai were the chief ports of foreign trade. The most important articles of import were textile fabrics, dye-stuffs and drugs. Copper coins were brought in large quantities, as Japan did not yet coin her money.

During the troublesome times which followed the decline of the power of the Yuen dynasty many lost their livings in China and turned pirates. Many Japanese adventurers joined the bands of pirates and plundered the coast towns of China. Their junks were known as «Bahan» vessels and were held in fear all along the coast. The government was incapable of suppressing them. To exercise closer supervision over the pirates, the Ming government sent passports to be given by the Japanese government to merchants going to China. Japan's relations with China continued in this state till the time of Hideyoshi.

In the end of the 16th century Hideyoshi, having brought into subjection all the princes of Japan, and put an end to internal disturbances, conceived the idea of conquering foreign countries. This was a skilful stroke of policy on his part as the newly subjugated princes would forget their own dissatisfaction in the glory of the nation. From his unprecedented successes he also seems to have come to believe in his mission of grand conquests. In 1590 he sent an Envoy to Korea to demand her to recognize Japan's suzerainty and also to tell China to do the same. As Korea refused to do either he made immediate preparations to invade the peninsula. In April 1592 a land force of 130,000 soldiers and a fleet manned with 9,000 sailors left from Kyushu. The army landed at Fusan, and was everywhere victorious. The capital was taken, the King fled, and two young princes of the royal blood were taken prisoners. Two Chinese armies sent in succor were defeated one after another. These signal defeats induced China to sue for peace. After some negotiations seven articles of peace were agreed upon, and a truce was concluded, the greater part of the Japanese army withdrawing from Korea. In these articles Hideyoshi demanded among other things the cession of one half of Korea, and as pledges for peace in future, the marriage of a Chinese princess with a Japanese prince of the Imperial blood, as also the giving in hostage of the Korean Prince Royal. The Chinese emperor did not ratify these terms, but thought Hideyoshi could be appeased by making him King of Japan. When in 1596 an envoy came to Japan with the imperial patent to that effect, and its purport was made known to Hideyoshi, the latter became so enraged as to throw the document on the ground and summarily dismiss the envoy. Renewal of the war was at once declared and in February of the following year the Japanese forces again left for Korea. The second campaign was not very successful at the outset. The Japanese suffered great losses from the combined Chinese and Korean armies. When they began to gain advantages and assert their superiority over the enemy the death of Hideyoshi (13 Sept. 1598), made the recall of the army necessary.

Iyeyasu, who was intent on promoting the material prosperity of Japan, wished to cultivate friendly relations with China and Korea, and tried to remove the feeling of enmity by restoring the captives of war. In 1606 Korea sent an embassy and renewed her commerce with Tsushima, but China repulsed the advances of Iyeyasu, and forbade her subjects to trade with Japan. Nothwithstanding this, all through the Tokugawa period Chinese merchants came in large numbers to the port of Nagasaki.

Japan was brought to the notice of Europeans for the first time by Marco Polo. His description of Zipangu, immensely rich in gold, made a deep impression on the mind of Europeans, and it is a well known fact that Columbus had the discovery of the island in view when he set out on his westward voyage. It was, however, in 1542 that the Europeans first

reached Japan. In that year three Portuguese adventurers, Antonio da Mota, Francisco Zeimoto and Antonio Pexoto by name, met a violent storm on their way from Siam to Ningpo, and after drifting for some days on the broad sea arrived at the islands in the south of Japan.* According to a trustworthy Japanese account† the first arrival of Europeans was at Tanegashima off the coast of Satsuma in 1543. But the «big ship with a crew of more than one hundred men of strange forms and unintelligible language» seems to have been other than the junk of the three adventurers. This ship seems to have come after the discovery was made known by the adventurers. The Portuguese commerce once opened grew in importance very rapidly. Already, in 1546 we find no less than three Portuguese vessels in Japan at the same time.

The Jesuit missionaries helped to bring about further growth of commerce. In 1547 a certain Yajiro of Kagoshima,* who having committed a homicide took refuge in a temple and became a bonze, was taken to Malacca in a Portuguese vessel. There he met Francis Xavier, who was one of the first members of the new order of Jesuits, founded in 1540, and was engaged since 1542 in the conversion of the East. Following Xavier's advice, Yajiro went to Goa and entered the Jesuit College of Saint Paul. He was baptised a short time afterwards, and was henceforth known as Paul of the Holy Faith. In 1549 Xavier left India taking with him Paul and his two servants, and two Jesuits —Father Cosmo de Torres and Brother Joãa Fernandez,—and arrived at Kagoshima on the 15th of August of the same year. After preaching about a year in Satsuma, Xavier was obliged to leave on account of the violent opposition of the Buddhist priests. He went to Hirado—Firando, as the Europeans used to call it—and thence to Yamaguchi. Xavier also visited Miako, the capital, but finding it in a state of great confusion consequent to the wars he gave up the idea of preaching there and returned to Yamaguchi. In November 1551 he left for India from the port of Hiji in Bungo. His stay in Japan was a little over two years and he made only about 700 converts, but he conceived such a good opinion of the convertibility of the people, that he wrote to Rome strongly recommending the sending of more members of the order. In order to facilitate the voyage, he proposed that the Viceroy of India or some rich merchants should be induced to send regularly trading vessels laden with pepper and European goods, which would sell very profitably. He urged that they must catch «every one by his own bait.» Xavier's suggestions were acted upon. Beginning with three in 1552, Jesuit missionaries were sent from time to time, and encouragement of the Japanese trade resulted in its rapid growth.

The Portuguese vessels first visited the ports of Satsuma and Bungo. Xavier induced these vessels to come to Hirado when he removed there, and so long as Christianity was favored the port remained a flourishing centre of foreign trade. But when in 1559 the Prince of Hirado acceded to the demand of the Buddhist priests and ordered the missionaries to leave the place, they persuaded Portuguese captains to visit other ports. In 1570 they entered the port of Nagasaki for the first time, and as the harbor was very convenient and the Prince friendly to the Christians it was made the port for Portuguese commerce. A few years later the Prince of Omura presented Nagasaki to the Church. The Jesuits made it the headquarters of their mission, and many churches and convents were built. The Portuguese settled there in large numbers, and Japanese merchants flocked from all parts of the country. Nagasaki, which was a small fishing village, soon became a very flourishing commercial town. After the conquest of Kyushu, Hideyoshi confiscated the territory and appointed a Bugyo to look after the government of this important town. At that time there were 23 streets and the hills had to be cut and the sea filled up, to make room for building houses.

In 1557 the Portuguese were allowed by the Chinese authority to establish a commerical settlement in Macao. The Portuguese vessels called at that port on their way from Goa to Japan, and leaving it in the end of June or early in July, they reached Nagasaki usually in about 20 days. In leaving Japan they had to sail by the northeast monsoon, which continued to blow from October to March, so that these vessels stayed in port during three to six months. This was the busiest season there. The chief articles of import were raw silk, cotton goods, silk and woolen stuffs from Europe, India and China, leather and glass wares of Europe, and spices of the Southern Islands. In return, the Portuguese merchants carried gold, silver and iron, rice, flour, ham and dried fish; lacquer wares, screens and arms were also exported. The trade was very lucrative and Macao owed its prosperity almost entirely to Japanese commerce.

In the meantime, missionaries were making steady progress. Many princes of Kyushu embraced Christianity and under the patronage of Nobunaga Christianity got strong foothold in central Japan. In 1582 the Christian Princes of Bungo, Arima and Omura sent at the suggestion of Father Valignani an embassy to Spain and Rome. Before this the Prince of Bungo sent an envoy to the Viceroy of India in the vessel by which Xavier returned to Goa, and afterwards, courtesies were exchanged between them. The Prince of Hirado also entered into communication with the Viceroy. But this was the first embassy to Europe. The embassy consisted of two young men of about 16 years of age, relatives of the Princes, and two samurais, a little older, with some Japanese and foreign

*Antonio Galvão, 'Tratado dos descobrimentos antigos e modernos,' etc. Lisbon, 1563.

†An essay on the introduction of fire-arms by Nampo, a learned priest of Kagoshima, who flourished at the beginning of the 16th century. Fernão Mendez Pinto's claim to the discovery of Japan has misled many writers. A manuscript history of the Church of Japan, up to 1634, compiled by Jesuit Fathers residing in Japan at the time, now in the Ajuda library at Lisbon, refute Pinto's claim, and describes the book as "written more for amusing one than for telling the truth."

*The history of the Church of Japan points out that the name Angero, which appears in most European books, is a corrupted form of Yajiro, who as a bonze adopted the name of Ansei.

Jesuits. They left Nagasaki in February 1582, and, stopping on the way at Macao and Goa, arrived at Lisbon in August 1584. Thence the embassy went to Madrid and were received in audience by Philip II. Nov. 1584. They then crossed the Mediterranean from Alicante to Leghorn and went to Rome via Pisa and Florence. On 23 March 1585, they made a public entry into the city and were received in a public consistory by Gregory XIII. The Pope died shortly after, so that the embassy had to wait for the dispatches till Sixtus V. was elected pope. They left Rome in the beginning of June, and after visiting Bologna, Ferrara, Venice, Mantova, Milan and Genoa, where they were very cordially received by the princes and doges, crossed the sea to Barcelona and thence went through Spain and Portugal to Lisbon. They set sail from the latter port in April 1586, and arrived at Nagasaki in July 1590.*

In Europe the embassy was a great success; the work of the Jesuits in Japan was highly appreciated and among other things they got the exclusive right of evangelizing the country. But on arriving at Japan they were greatly disappointed. The Prince of Bungo was already dead, and his successor was neither so powerful nor so zealous for the interest of Christianity. The Prince of Omura was also dead. Father Valignani, who accompanied the embassy from Goa as the Viceroy's ambassador, was granted an audience by Hideyoshi, but with the express condition that there would be no talk on religion and in his answer to the Viceroy Hideyoshi stated his reasons for expelling the Jesuits and prohibiting Christianity. The edict, however, was not strictly enforced. In 1592 there were altogether 125 Jesuits—40 Fathers and 85 Brothers—and 166 native catechists in 20 houses and residences, one college and one seminary. The number of the Christians steadily increased by the combined efforts of these workers.

By this time there were many missionaries well versed in the Japanese language. Many of these devoted themselves to the translation of religious works. As Valignani brought a quantity of European type with him many of these, like 'Doutrina Cristã' (Amakusa 1592), 'Contemptus Mundi' (Amakusa 1596), etc., were printed in Romanized Japanese. They also printed 'Dictionarium Latino-Lusitanicum ac Japonicum' (Amakusa 1595), 'Vocabolario da Lingoa de Japão' (Nagasaki 1603), and 'Arte da Lingoa de Japão,' by Father João Rodriguez (Nagasaki 1604). All these rendered great service to foreign preachers. Many religious works were also published in Japanese and must have given further facilities to the mission work.

In the 16th century the Philippine Islands were frequented by Japanese pirates, of whom mention has already been made. In 1574, only four years after Legaspi took possession of the city, a Japanese corsair attacked Manila at the head of 600 men and was about to take it, when relief arrived and obliged him to retire. Being re-enforced by the pirate Limahon, to whose famous band he belonged, the corsair returned to the attack some days later, but was again repulsed, and finally left the Islands. In 1581 another band of Japanese pirates was driven out of Cagayan after a bloody fight with the Spaniards. But it was in 1584 that we first find mention of the coming of the Spaniards to Japan. In August of that year a ship from Manila bound for Macao entered the port of Hirado by the captain's almost incredible ignorance of the seas. The Prince of Hirado seized the opportunity to send a letter to the Governor, asking him to send a letter with missionaries every year. The vessel left for Macao in October, but we hear no more of the affair. In the spring of 1592, Hideyoshi sent an envoy to the Governor of the Philippine Islands demanding him to recognize the sovereignty of Japan, and threatening him with an invasion in case he hesitated to do so at once. The embassy with Harada-Magosichiro at its head arrived at Manila, 29 May. Magosichiro was well known in the city which he had previously visited as a merchant. At that time the number of the Spanish soldiers in Manila was small and wholly inadequate to defend the place. As it was rumored that the warlike preparations then in progress in Japan were really intended for the Islands, the Philippine Government thought it better to dissimulate and gain time. Pretending that the low birth of the envoy made the embassy suspicious, and that they could not understand the letter as there was no one to interpret it,* the Governor, Gomez Perez das Mariñas, sent Fray Juan Cobos with a letter and some presents to Hideyoshi. At the same time he wrote urgent letters to Mexico and Spain informing the King and the Viceroy of the situation, and asking for an immediate re-enforcement. Father Cobos arrived in safety at Hirado, and saw Hideyoshi at his headquarters at Nagoya in the province of Hizen. He left with a letter of Hideyoshi confirming the first, but his ship was wrecked off Formosa, and only the ship of the second Japanese ambassador, Harada-Kiyemon, reached Manila in the end of May 1593. Making the loss of Hideyoshi's letter another pretext the Governor sent a second embassy. Fray Pedro Baptista saw Hideyoshi at Nagoya and sent his answer to Manila by one of his suite, he himself remaining as hostage with other Franciscans of the embassy. A council of chief officials at Manila which met on receiving this letter, 24 April 1594, was of the opinion that a downright refusal to submit would only serve to irritate Hideyoshi and precipitate his invasion, and decided to send a letter expressing their willingness to continue friendly relations with Japan and promising to answer more particularly on receiving instructions from Madrid. By this time Hideyoshi must have become aware of the duplicity of the Philippine Government, but he

*Many documents relating to this embassy, among which are some letters of the ambassadors in Japanese, are still extant in the Italian archives, especially in the Vatican archives, and the State archives of Rome, Florence, Venice, Mantova, Modena, Milan and Genoa. The more interesting of these have been published: G. Berchet, 'Le antiche ambasciate Giapponesi in Italia,' (Venice 1877), and Boncompagni Ludovisi, 'Le prime due ambasciate dei Giapponesi a Roma' (Rome 1904).

*A Spanish translation of the letter still preserved in the Archivo de Indias, at Seville, proves that this was a mere pretext. The translation, probably made by some Chinese, almost exactly corresponds with a Japanese draft in existence. Many other documents relating to this affair are preserved in the same archives.

was then so deeply engaged in the Korean war that the idea of invading the Islands, if he ever really entertained it, had to be given up for the moment. In 1596 a richly laden Spanish galleon called *San Felipe* encountered a violent storm on her way from Cavite to Acapulco and took refuge in a port of Tosa. Hideyoshi forfeited the ship with all its goods. It is said that the captain, wishing to impress the Japanese with the greatness of Spain, pointed out on a map of the world all the Spanish possessions, and when asked how all those territories were obtained, explained that it was by sending missionaries first, and then soldiers to co-operate with the converts in subduing them. This alarmed the authorities, confirming them in the suspicions they already entertained. Hideyoshi immediately ordered Father Baptista with five Franciscans and some Japanese who were in their service to be put to death on the charge of having preached Christianity contrary to his edict. The new Governor, Don Francisco Tello, demanded restitution of the forfeited goods and satisfaction for the execution of the ambassador and his suite, 1597. Hideyoshi answered by simply stating that a ship wrecked on the Japanese coast belonged by right to him, and that the priests were executed because they disregarded the laws of the country and were laying plans to get possession of Japan. Don Francisco did not make any further protest. The commerce with Japan to which the Spanish settlement owed its supply of provisions, iron, nails and other material for shipbuilding, was so important that the Philippine Government was ready to overlook any slight rather than lose it.

When Iyeyasu succeeded to the Government he adopted an entirely different attitude towards the Islands, as he did towards Korea. He asked a Franciscan Father in Japan to communicate to the Governor his desire to maintain friendly relations with the Islands. In 1602 he sent an embassy to Manila and the Governor, Don Pedro de Acuña, cordially responded to it. In compliance with the request of Iyeyasu he sent vessels to the port of Uraga yearly. Iyeyasu also wished to establish commercial relations with Mexico. He repeatedly asked the Governor to make his desire known to the Viceroy. When in 1609 the galleon *San Francisco* was wrecked on the coast of Kazusa and Don Ridrigo de Vivero, ex-Governor of the Philippine Islands, who was one of the passengers, visited Suruga, Iyeyasu mentioned his desire. Don Rodrigo, seeing an opportunity for the Christianization of the land and the expulsion of the Dutch who had established a factory at Hirado, promised to use his influence to bring about the desired relations and consented to make the voyage to Mexico in a Japanese ship. The ship registered 120 tons, and had been built some years before by William Adams, an English pilot who had been in Japan *since 1600*. Fray Alonzo Muñoz, a Franciscan Father, left in the same vessel with the letters of Iyeyasu to the King of Spain and his minister, the Duke of Lerma. The *San Buenaventura* set sail from Uraga, in August 1610, and reached Matanchel in October. This was the first Japanese ship that ever sailed to Mexico.

In April 1600, a Dutch ship called the *Liefde* arrived at Bungo. It was one of the five ships and left Texel, June 1598, with the intention of reaching the Molucca Islands by way of the Strait of Magellan. The crew, of whom only 18 survived, remained in Japan. In 1605 the captain, Jacob Quackernack, sailed from Hirado in a junk of the Prince with a letter of Iyeyasu and a passport for the Dutch vessels that would come to Japan. In 1608 the directors of the Dutch East India Company, hearing that a truce for 10 years was about to be concluded between Holland and Spain on the basis of maintaining the status quo, sent a despatch boat to the Commander of the fleet in the East instructing him to make treaties with as many native princes of the East as possible, and especially with Japan. Admiral Verhoeven accordingly ordered two ships, the *Roode Leeuw met Jijlen* and the *Griffoen*, to Japan. They arrived at Hirado, 2 July 1609, established a factory there and left 3 October, with a letter to the Stadtholder and some passports from Iyeyasu. After the arrival of the *Liefde* the Portuguese and the Spaniards tried every means to induce the Government to send the Dutch out of Japan, but Iyeyasu in pursuance of his policy of encouraging foreign commerce, steadily refused to take such a step.

When Don Rodrigo arrived at Mexico an expedition was about to leave for the discovery of the Isles of Gold and Silver, which was said to be situated near Japan. It was decided that Sebastian Vizcaino should go first to Japan and thank the Government for the courtesies shown to Don Rodrigo and thence to set out on the voyage of discovery. Vizcaino left Acapulco, 22 March 1611, taking with him the Japanese merchants who accompanied Don Rodrigo, and arrived at Uraga, 10 June 1611. He was received by the Shogun and Iyeyasu with great ceremony. With permission of the Government he sounded the eastern coast of Japan and then set out from Uraga, 16 Sept. 1612, on the voyage of discovery. After sailing about for many days the ship suffered so much from the storms that Vizcaino was obliged to enter Uraga again, 7 November. This time he encountered a reception quite different from the first. The enemies of the Spaniards insinuated that the soundings of the coast were made with a view to the coming invasion and Vizcaino's silence about the Isles of Gold and Silver was also commented upon as a treacherous act. These added to the dislike the authorities had entertained of the overbearing attitude of Vizcaino. Vizcaino was baffled in all his attempts to get a vessel to take him back to Mexico. He was obliged to accept the proposal of Date-Masamune, a powerful prince in the North of Japan, to take passage in his ship. The ship was to carry an embassy of Masamune to the King of Spain and the Pope, with the object of asking them to send Franciscans to teach Christianity in his dominion, for whose voyage Masamune offered to send ships to Mexico every year. The moving spirit of the embassy was Fray Luis Sotelo, who wished to open a field of action for his order. With the same object he had promoted the embassy of 1610, but there was no news of Father Muñoz. He grew impatient and determined to go himself.

He was aware of the desire of Masamune to open commerce with Mexico. He saw his opportunity in the embarrassment of Vizcaino, and persuaded Masamune to send Vizcaino and his crew to Mexico in his ship. He himself undertook to go with Hasekura-Rokuyemon, a retainer of Masamune, to make a commercial treaty with the court of Spain. The ship set sail from the port of Tsukinoura, 28 Oct. 1613, and arrived at Acapulco, 25 Jan. 1614. Thence the embassy proceeded to Mexico and embarking from Vera Cruz, 10 June, entered the port of San Lucar on the 5th of October. They were magnificently entertained in Seville, where they took a letter of Masamune* with his presents. The embassy proceeded to Madrid, and had an audience of the King, 30 Jan. 1615. Taking passage from Barcelona in a ship bound for Genoa the embassy arrived at Rome, 25 Oct. 1615. Pope Paul V., who was impatiently waiting for the arrival of this second embassy from Japan, received them with great honors. He recommended the King of Spain to accede to the desire of Masamune and nominated Sotelo bishop of the north-eastern part of Japan. Hasekura was made a noble, and the samurais of his suite citizens of Rome. The embassy left Rome, 7 Jan. 1616, visited the Grand Duke of Tuscany on their way, and retraced their steps from Genoa to Seville. Considering the religious zeal of the King of Spain, this embassy was expected to accomplish its object easily, but it was doomed to share the same fate as that of Father Muñoz. Muñoz arrived at Madrid at the end of 1611, but his mission proved a failure. Fray Diego de Santa Catalina was sent after long delay as envoy and arrived in the ship of Masamune at Uraga, August 1615, but as the letter of Phillip III. said nothing about the commerce, the government refused to accept the presents, and dismissed Fray Diego in disgrace. In default of any other vessel Fray Diego made another voyage in Masamune's ship, contrary to the orders of the Viceroy, and arrived in Mexico. 1 March 1617. The failure of Muñoz's embassy was mainly due to the strong opposition on the part of the merchants of Manila, who desired to monopolize the Japanese trade. In the case of Masamune's embassy, another factor entered. The Jesuits, fearing that its success would secure to the Franciscans the same advantages that the embassy of 1585 did to themselves, used their powerful influence to bring about its failure. The persecution of 1614 was made use of to discredit the embassy. Neither the recommendations of the Pope and the Municipality of Seville nor the utmost efforts on the part of the embassy were of any help. The embassy had to leave for Mexico in 1617 without having accomplished its mission. In the spring of 1618, they embarked at Acapulco in the ship that was waiting for them since the previous year and sailed for the Philippine Islands. Hasekura returned to Japan in 1620. Sotelo, who was placed under strict vigilance of the authorities, finally succeeded in evading it and embarked for Japan, 1622. He was easily recognized, thrown into prison and put to death, August 1624.

The attempts to establish a regular trade with Mexico ended in failure. But all this time the foreign commerce of Japan kept steadily growing. In 1612 two Dutch ships arrived at Hirado. These were the first ships sent from Amsterdam after receiving the news of the establishment of a factory in Japan. The Dutch commerce was now regularly established.

In 1613 another competitor entered the field. The East India Company of London, which long cherished the idea of trading with Japan, at last sent, in April 1611, Captain John Saris with the express object of establishing a factory in Japan. Captain Saris arrived 11 June 1613 on board the *Clove* at Hirado. William Adams, whose presence in Japan was known in England, was sent for, and with his help ample privileges were obtained, and a factory was established at Hirado.

After the death of Iyeyasu, 1 June 1616, the Shogun adopted a new policy toward the foreigners. He began with ordering the Dutch and the English to recall their agents at Osaka and Yedo, and to limit their trade to Hirado and Nagasaki. He adopted a more severe measure towards Christianity, and seeing that the missionaries continued to come from the Philippine Islands against his repeated orders, he prohibited the visit of Spanish vessels in 1624. An embassy, which came from Manila in 1625 to ask for the renewal of the trade, was sent back with orders to come no more.

The English and the Dutch, confined to the small market of Hirado, began a sharp competition between themselves, and even went so far as to fight with each other in the street. The English suffered very much from this competition, and felt themselves greatly relieved when a Treaty of Defence was made between the two nations. A part of the Fleet of Defence was stationed at Hirado and used to go out on piratical expeditions from that port and return there with prizes. This was the busiest time for the English factory (July 1620—August 1622). Very soon after the fleet was disbanded, the factory was dissolved as unprofitable, and the members of the factory left for Batavia, 24 Dec. 1623. The rejoicing of the Dutch at this event did not last long.

In 1624 the Dutch founded a commercial settlement in Formosa with the consent of China. There they found many Japanese already trading with the Chinese. Formosa, then known as Takasago, seems to have been a favorite rendezvous of Japanese pirate vessels, and since the time of Hideyoshi several attempts were made to subjugate the island. Such being the case the Japanese vessels that entered the port refused to pay the customs duties levied by the Dutch. Hamada-Yahyoye, captain of a junk, was especially offended at the treatment he received and took to Japan 16 natives of Sinkan as ambassadors sent to offer the sovereignty of the island to the Shogun, 1627. The Shogun received them at the court, and sent

*The letters of Masamune to the city of Seville and the Pope are still kept in the municipal archives of Seville and the Vatican library respectively. Correspondences, resolutions, reports and other documents relating to the embassy are abundantly preserved in the municipal archives of Seville and the Archivo de Indias. Documents from the Vatican and the State archives of Venice and Genoa have been published in the works of Berchet and Boncompagni-Ludovisi already referred to.

them back with presents. A few months later Pieter Nuyts, Governor of Formosa, went to Japan to notify the Government of the occupation of Formosa and to negotiate for the prohibition of Japanese junks going to Formosa. But he was not even received by the Shogun, and returned to Formosa greatly offended. When Hamada arrived there with two junks in 1628, the Governor threw the natives into prison and confiscated the Shogun's presents. He then took on shore all the arms in the junks and tried to keep the junks till he had consulted the chief factor of Hirado on the steps to be taken. Hamada called on the Governor with some companions and taking him unaware made him prisoner. The Dutch came to the rescue in large numbers but could do nothing lest Nuyts should be killed. After some negotiations Nuyts was released in exchange for five hostages, among whom was his young son. Restitution was made for the damages suffered by the Japanese, and the junks were allowed to leave in company with a Dutch ship which carried five Japanese hostages to be exchanged with the Dutch at Nagasaki. On their arrival the Government threw the Dutch hostages and the more important members of the crew of the Dutch ship into prison, sequestrated the ships at Hirado and put strict watch on the Dutch factory.

Greatly alarmed at this news the Governor-General recalled Pieter Nuyts to Batavia and sent an envoy to Japan to explain the Formosa affair, 1629. But the Japanese Government remained inexorable and insisted on the surrender of the fort in Formosa. The Governor-General decided to make Nuyts the scape-goat. When he arrived in 1632 and was delivered to the Government, other prisoners were released, the Dutch trade was restored and the claim to Formosa was given up. Nuyts himself was released in 1636.

After strict measures had been adopted to stop the entrance of missionaries, Japanese priests educated abroad were sent. The Government now resorted to a strict supervision upon Japanese junks engaged in foreign trade and the Japanese coming back from abroad, 1633. Finding this still inadequate the Government prohibited all Japanese junks to go abroad under severe penalty, 1636. This put an end to an active trade with Siam, Anam, Cambodia, Champa and most important places of the Malay peninsula, which had continued to grow since the time of Hideyoshi and with whose sovereigns the Tokugawa Government used to carry on correspondence. In many of these places there were considerable Japanese settlements; the Japanese soldiers of fortune sometimes played very important rôles, like Yamada-Nizayemon in Siam.

The Portuguese merchants were shut up in an artificial island, Desima, in the harbor of Nagasaki, 1635, and all the descendants of the Europeans in Nagasaki and Hirado were sent away. In 1637 the peasants of Arima, who had been long groaning under heavy taxes, rose against their oppressors. The Christians of Amakusa joined them. After some delay the Government forces arrived. The Christians defended themselves very bravely in the castle of Hara, some 40,000, women and children inclusive, against 120,000 trained soldiers. The siege lasted for more than three months, but the castle was finally taken by a general assault.

This revolt made the Government even more suspicious of the Christians, and suspecting that the Portuguese were at the back of the rebels decided to put an end to the Portuguese commerce, which although broken in 1610, when the Prince of Arima attacked the *Madre de Dios* in the harbor of Nagasaki as the captain had refused to appear before the authorities and answer the charge of having murdered some Japanese who visited Macao in 1608 in a junk belonging to the Prince, and the ship was accidentally burned and all the crew perished, was restored in 1611 by Dom Nuno Sotomaior who came as ambassador of the Viceroy. Two vessels which arrived in 1639 were sent back with orders never to return under penalty of death, and when in 1640 an embassy came from Macao, the ambassadors with all their suites excepting 13, mostly blacks, were executed and the ships sunk.

In 1647 an attempt at the renewal of the trade was made by Dom Goncalo Siqueira de Souza, who came to Nagasaki as Ambassador from Portugal to announce its independence from Spain and the accession of John IV. to the throne, but it proved a failure. Another attempt was made in 1685, when a junk with 12 Japanese was wrecked off Macao, but the captain of the vessel that took them to Nagasaki was sent back with strict injunctions to return no more.

The relations with Portugal, however, lasted so long that they have left many indelible traces. In the Japanese language there are numerous words of Portuguese origin, some of which are so perfectly naturalized that their foreign origin does not strike one at once. Such are: boro (bolo, cake), kompeito (confeitos, comfits), pan (pão, bread), karuta (carta, cards), biidoro (vidro, glass), shabon or sabon (sabão, soap), batteira (bateira, boat), rasha (raxa, cloth), jiban (gibão, undershirt), birodo (veludo, velvet), kappa (capa, cloak), zambo or zabon (zamboa, pompoleon), marmero (marmelo, quince), etc.

When the Portuguese ships were sent away in 1639, the Dutch thought that they had now got the monopoly of the trade, and it was made an occasion of a fête at Batavia. But they were very soon undeceived. In November 1640 they were ordered to demolish the new stone warehouse at Hirado, and the next year they were removed to Nagasaki. They were closely confined in the small island of Desima which they were seldom allowed to leave. There they were allowed to carry on commerce on a limited scale under strict supervision of the authorities. All these measures were taken to prevent the entrance of Christian missionaries. Every conceivable device that might be resorted to by them was carefully provided against. The Government succeeded so well that after the execution of some missionaries who came in 1643, only one more attempt is recorded. In 1708 a Jesuit Father, Giovanni Battista Sidoti, landed at an island near Satsuma, but was discovered and sent to Nagasaki and thence to Yedo where he died in prison 1715.

The policy of seclusion was carried out. Besides the Dutch only the Chinese and Koreans were allowed to trade with Japan, and em-

bassies were sent from Korea on occasions of the Shoguns' assuming the Government.

During the centuries that followed, the only notices Europe had of Japan were through the Dutch. Engelbert Kaempfer (1690-1692), Charles Peter Thunberg(1775-1776), and Philipp Franz von Siebold (1822-1830), all physicians to the factory of Nagasaki, contributed above all others to the knowledge of Japan in Europe. The works of Isaac Titsingh, J. F. van Overmeer Fisscher and G. F. Meijlan, who were directors of the factory, gave further information about Japan.

Whatever Japan received of the material civilization of Europe was through the Dutch. Especially after the Shogun Yoshimune (1716-1745) did away with the proscription of European books, so far as they had nothing to do with Christianity, the study of Dutch books became very popular. Many scientific books were translated from the Dutch, and great progress was made in mathematics, astronomy, medicine, natural sciences and military arts. The official visits paid from time to time by the directors of the Dutch factory, usually accompanied by physicians, were the opportunities eagerly seized by the savants of Yedo to learn more about Europe and her science. The Dutch scholars came to be leaders in thought and many of them played a very important part in bringing about the new era.

At the end of the 18th century this state of quiet seclusion in Japan was disturbed. The English, who were baffled in their attempt to renew the trade in 1673, when they sent the ship *Return* from Formosa, repeatedly visited the Japanese seas after 1791. In 1813 and again in 1814 vessels sent from Batavia by Lieutenant-Governor Raffles tried to take the factory at Nagasaki in the English hand, but were thwarted by Director Hendrik Doeff. Before this the Russians, who had been gradually proceeding southwards from Kamchatka since the beginning of the 18th century, made several attempts to open intercourse with Japan. In 1792 Lieutenant Laxman came to Matsumaye with some Japanese who were wrecked in the Okhotsk Sea and was directed to Nagasaki for negotiations. In 1804 Count Resanoff accordingly came to Nagasaki, but his mission was a failure. In 1813, Captain Rikord was sent back with Golownin from Hakodate with a notice that Japan desired no commerce. In 1837 the *Morrison*, fitted out by an American firm at Macao to return some shipwrecked Japanese, visited the bays of Yedo and Kagoshima, but was driven off. In 1848 Commodore Biddle, who commanded the American fleet in the China Sea, came to the Bay of Yedo with two warships to ascertain if the Japanese ports would be opened and was sent back with a negative answer. An embassy, which King William III. of Holland sent in 1844 with the express object of persuading Japan to open her ports to European nations, equally failed. When, however, Commodore Perry entered Uraga with a fleet of four ships, 8 July 1853, and delivered a letter of President Fillmore, asking «friendship, commerce, a supply of coal and provisions, and protection for the shipwrecked people,» and returned for an answer early the next year a treaty was concluded and signed at Kanagawa, 31 March 1854. Japan consented to open the ports of Shimoda and Hakodate to the American trade.

In 1858 a new treaty was made with the United States, substituting the port of Yokohama for Shimoda, and promising to open Nagasaki, Kobe and Niigata or another port on the western coast of Japan. On the basis of these treaties, Japan concluded treaties with Great Britain, Russia, the Netherlands and France (1854-1858) and at somewhat later dates with other Powers of Europe.

The opening of the country after so many centuries of isolation could not be effected without opposition. The Shogun's government was severely criticized for having taken such a weighty step without having first asked the sanction of the Emperor. Ii Kamon-no-Kami, Prince of Hikone, was assassinated as being chiefly responsible for the conclusion of the treaties, 24 March 1860. The Emperor repeatedly ordered the Shogun to take vigorous measures for the expulsion of foreigners. The Shogun's government tried to explain this state of affairs to the Powers and requested them to withdraw, but the Powers would not consent to do so. The hostile act of the Prince of Nagato towards foreign vessels passing the strait of Simonoseki, and frequent outrages committed by samurais against European residents caused great trouble to the Government. These and other troubles induced the Shogun to resign and restore the power to the Emperor, 9 Nov. 1867. The Government of the Emperor now took a measure adapted to the need of the times and ratified the treaties, and the Emperor received foreign representatives in audience, 1867. The expulsion of foreigners was, indeed, a cry raised for gathering those who were against the Shogun's régime.

Having once given up her policy of seclusion, Japan exerted herself to the utmost to enter into closer relations with foreign countries. When the vexatious problem of revision of treaties was finally solved after so many abortive attempts (1892-1897), the whole country was thrown open to foreigners and all the restrictions hitherto imposed on them were removed. After her co-operation with the Western Powers during the Boxer trouble in China (1900) Japan was fully admitted to the comity of civilized nations.

In recent times Japan was more than once brought to the verge of war with China: in 1874 when a Japanese army was sent to Formosa to punish some aboriginal tribes in the south for having repeatedly murdered the Japanese subjects wrecked on their shore, and in 1879 when China objected to Japan's making the Ryukyu Islands an integral part of the Empire by converting them into the prefecture of Okinawa. But the rupture came when China refused to acknowledge the independence of Korea. The war opened with the naval encounter off the coast of Yashan, 25 July 1894, and ended in a complete defeat of China. A treaty of peace was signed at Simonoseki, 17 April 1895. China acknowledged the independence of Korea; ceded Formosa and the Pescadores to Japan, and promised to pay a war indemnity.

The interference of the three Powers—Russia, Germany and France—which obliged Japan to give up the possession of the Liaotung peninsula, was very much resented by the nation. The exchange of Saghalien with the Kurile Islands in 1875 was always regarded as an act of injustice on the part of Russia. Russia's advance in Manchuria and her growing influence in Korea alarmed Japan, and war finally broke out, 8 Feb. 1904. After a succession of brilliant victories, both by land and sea, for Japan, peace was made by the Treaty of Portsmouth (q. v.), 5 Sept. 1905. That part of Saghalien, south of the 50th parallel of North Latitude was ceded to Japan. Russia promised to withdraw from Manchuria and acknowledged Japan's special interest in Korea. The new Convention between Japan and Korea, 17 Nov. 1905, established Japan's position in Korea.

Japan's status as one of the Great Powers was established by her successes in the wars with China and Russia, and found its recognition in the offensive and defensive alliance Great Britain concluded with her in January 1902 and August 1905. See ANGLO-JAPANESE TREATIES.

8. Japan—The Samurai. *Definition and Etymology.*—Samurai, now domiciled in the dictionaries of European languages, is a strictly Japanese term, being derived from a verb—*samurau*, to attend, to wait upon, to serve. Samurai, therefore, meant originally a person who attended upon another—naturally upon his superior. But the use of the term was confined to honorable and personal service, and as in the course of time, under the régime of feudalism, class distinctions and different grades of honor were instituted and certain kinds of service, notably the military, became more exclusive, the term samurai was applied only to those belonging to the military class of the feudal clans. In a wide sense it included the whole of the military nobility, the warrior class: though in a more usual and restricted sense, it meant the inferior nobility exclusive of the *daimyo*, much like the English knights bachelors, whom Blackstone defines as «the most ancient though the lowest order of knighthood.»

The idea of what the samurai was, can, perhaps, be better conveyed by comparing him with his compeer in Europe than by a mere etymological explanation. Almost every nation has had at one time or another—especially under the régime of feudalism, but even prior to it—something like the usage of knighting, whether it was done by means of a formal rite or not. Cæsar speaks of the institution of *soldurii* in Aquitaine; Tacitus mentions that of *comitati* among German tribes; the Romans had *equites aurati;* Mediæval Germany had *Ritterschaft;* France her *chevaliers;* in fact continental Europe boasted of the existence of *Milites medii.* It can scarcely escape the most cursory glance that several of these terms bear an etymological relation to the horse, obviously because the knights served on horseback, whereas the common soldiers marched on foot. It is interesting to note, however, that the English word knight has no reference to a horse—its original meaning being the Saxon cniht, signifying *puer, servus* or attendant, this possessing a significance strangely parallel with samurai. Samurai is, or was, explained as being strictly of Japanese origin; but as is the case with every word in the Japanese vocabulary, there is either its equivalent in pure Chinese or a sinified expression for it. In fact, both in literature and formal speech, it was considered more dignified to adopt the sinico form; so that the term *Shi* (the nearest Chinese equivalent for gentry), or *Bushi* (fighting nobility), or *Buké* (warrior family), came to be used almost as commonly as the pure Japanese original. In contrast to the sinico Bushi may be mentioned its archaic equivalent in purest Japanese. The word *mono-nofu* or *mono-nobe,* literally «article bearer;» *i. e.* the wearer of arms—more especially the sword, which was the distinguishing article worn by the order. Some derive it from a word meaning thing-doer, one who acts or does anything, the most important thing of course being fighting. Still another archaic term is *masu-rao,*—strong man, and though this was used in contrast to weak woman, and therefore meant simply masculine personality, it was often applied in the sense of samurai. Both *masu-rao* and *mono-nofu* are now used almost only in prosody.

History.—As has already been hinted at, the germ of the institution of a separate class comprising the fighting force, can be found in the term samurai. But it took centuries of gradual development for it to assume a narrow exclusive meaning. Formerly there was no separate class of warriors. Whoever was possessed of two brawny arms and two stalwart legs, joined an army in times of need, and whoever added to strong limbs the possession of a powerful will and stout heart, became a leader. Even after the leadership, gained by personal superiority, became hereditary, the fighting force was not separated from the mass of the population. The industrial, which was almost entirely agricultural, and the military, or militant, classes were not differentiated.

When the bugle sounded, the peasants left their plows and hurried to the front. At the end of the war, they plodded back to the fields. Such an arrangement sufficed for the maintenance of peace so long as the central authority was strong enough to be feared and its order easily respected, or, what amounts to the same thing, so long as local life was too weak to assert itself in opposition to the central will. But the constant warfare of the middle ages necessitated division of labor—consequently of social classes, and by the end of the 8th century we notice that the samurai formed a pretty clearly defined order.

About the 9th and 10th centuries, the governors of the provinces were not only appointed from Kyoto, where was the seat of government, but were usually despatched from among the court nobility, much like the prefects of the Roman Empire. They served a number of years in the country, feeling like exiles, always yearning to go back to the court and the capital. While such feeling was general there was little danger of local life becoming strong or turbulent, but as the population

grew throughout the Empire, and villages developed into towns, the service of a prefect changed to one less onerous and fatiguing. The more ambitious shared with Cæsar the sentiment that they would rather be first in a mountain village than second in Rome. Such men would willingly stay in their provinces, where they would surround themselves at least with a body-guard and perhaps with an army, particularly if they had danger to fear from any source. They took pains to have ready a certain number of trained fighters for emergency. Governors who by these and other means gained influence and power in their localities, were soon rooted in them, so that when their term of office expired they either begged for postponement or flatly refused to be moved. Oftener still did it happen that the offspring of the prefects were left behind in the provinces and these were naturally treated with deference by the people. As they and their relatives increased in number, they came to form a class between the high nobility and the rest of the population. They were naturally possessed of landed estates; for in spite of the fact that private ownership of land was forbidden by law, as there was little control exercised by the court, the local magnates actually owned large tracts of land in their own names. It was the owners of large manors (*shoyen*) who were called «great names» (*daimyo*), and these surrounded themselves with armed protectors, to whom the ancient title of *mono-nofu*, or samurai, was applied. This was a quite common origin of hereditary governorship, which later developed into feudal relations. It is not to be inferred that this was the chief cause of feudal institutions. The growth of feudalism was so gradual that no definite dates can be assigned to each step of its progress; but in the 12th century, when Yoritomo inaugurated the régime of feudalism, the samurai order was in full swing of development and continued to flourish during succeeding centuries, until it was abolished in 1871.

We must bear in mind in following the history of the samurai that they never formed a close corporation. The class was kept up by heredity, but was never wholly exclusive. It was recruited from among the peasants, or even from the much despised merchants, provided the candidates proved themselves efficient in any branch of military art. It was also possible for the samurai to adopt promising boys from other classes than their own. While the order could thus be replenished from outside, such of its members as proved unworthy of its privileges could be excluded,—as for instance by being deprived of their rights of samurai by their lords (daimyo) or by having their lands expropriated. This would leave them without the means to maintain their livelihood, not to speak of their pretensions. Even at present the samurai are recognized under the appellation of *shizoku* (*shi*-class); but this is only a name, implying neither rights nor duties. In 1871, when they were mediatized, many of them surrendered even their title. Their revenues, which had been given them in so many bushels of rice a year, were commuted into interest-bearing bonds and their peculiar privileges were taken away, to make place for the general conscription whereby the whole nation was, so to say, raised to the rank of the samurai, as far as the right of fighting for the country was concerned. Still the order contained about 400,000 families, or 2,000,000 souls, and in every way formed a formidable power in the empire. Primarily a fighting order, the samurai were political rulers in times of peace. In the four-fold classification of the people, they were at the head,—the rest being the tillers of the soil, the artisans, and lastly the merchants.

As an army they comprised the bravest and cheapest defense of the nation; as an economic factor they were the most important land owners; and considered merely as consumers they created the chief demand for the finer products of manufacture and art; as an intellectual power they were scholars in every field of knowledge, whereas the priests, if deeper in their studies, confined themselves to Buddhistic lore; as a moral potency they set the standard for the entire nation, and it is in this last aspect that we shall treat the samurai in this article. The moral teachings of the samurai are contained in an unwritten code of ethics, which, for want of a better name, may be called Bushido.

Bushido.—Literally «the way of the warrior,»—means the principles which should guide the samurai in his dealings with himself and with the rest of the world. It means the *noblesse oblige* of the fighting order, the Precepts of Knighthood. It may be roughly rendered as the moral notions of Japanese chivalry. Very often the term is employed in a broad sense when it includes more than moral precepts, bringing within its compass the technical arts which a samurai was expected to master. Of course these arts were mainly of a martial character, *e. g.*—fencing, jiujutsu, horsemanship, the use of the spear and of the bow and arrow—later of the gun. As improved methods of warfare were introduced, the technical part of Bushido training lost its importance, except as an efficient mode of physical exercise; but its ethical part is still a spring at which the Japanese people drink and refresh their moral existence.

Before proceeding with a resumé of its precepts, it may be well to dwell more fully upon the fact that Bushido is not a written code of morals. It possesses neither a Bible nor a Koran, and though the writings of Confucius and Mencius furnish it with no mean ethical principles, Bushido is neither Confucianism nor Mencianism. There is no systematic treatise on the principles or precepts of Bushido, and if now and then an attempt was made at one, it failed of general acceptance. Like a Volkslied or proverb, it is the product of many minds that put a word there or changed it here, and which the mass of its followers sanctioned as true to their experience; or—to take a more diginified example, its growth was like that of the British constitution, unformulated and unwritten, but not the less with mighty power to accuse or excuse man's action. It consists largely of the *modus operandi* of right conduct and soul discipline. The last expression—soul discipline—is used advisedly, as I hesitate to

use freely a more exalted term—spiritual culture. If asked to enumerate the articles of faith and of the ethical doctrines of Christians, one might answer by presenting a copy of the Bible or perhaps the Nicæan creed or a treatise on theology; but if asked to tabulate the duties of an English gentleman, one would feel the inadequacy of any systematic treatise. The letters of Chesterfield cover but a small fraction of a gentleman's duties, and Froissart's Chronicles and the Waverley novels do not form a system. This is exactly the case with Bushido. Japanese literature is not altogether wanting in attempts at a more or less orderly presentation of the samurai's duties and privileges; but none rose to the rank of a classic and none was adopted as a standard. The samurai belonged to different clans, being retainers of different lords. Though the daimyo were usually in hostile relations one to another, and though their retainers necessarily shared in these relations, still there was the consciousness of a common bond, the sense of identity of interests among them. They knew their vocation and interests, as distinct from those of other classes of the community, were the same regarding themselves, irrespective of the differences of the clans in which they served. *Bushi wa aimi tagai* («the samurai are the same one with another»). Being so closely allied in their calling and interests, it was only natural that they should come to adopt—even without mutual consultation or joint session—the same rules of conduct, primarily, as I imagine, in their public quasi inter-state, or literally inter-clan, relations, and later in their private conduct.

It is almost axiomatic that the ethical obligations of any social, exclusive class show wider divergences than the laws of morality which unite man to the world in general; in other words, a class such as the samurai has a very high conception of some responsibilities and yet it may tolerate the most lax ideas in others. It cannot be denied, as Crozier says in his 'Civilization and Progress,' that «the code of honor which regulated the intercourse of the upper classes in the old aristocracies had much more influence on their conduct than the ten commandments.» The strength and weakness of any class morality lie just here, and this is true of Bushido. In its eagerness to foster the masculine virtues, it neglected the proper education of the gentle sex; in its one-sided appreciation of military valor, it discarded industrial worth; in its exaltation of samurai prerogative, it set at naught the commonest rights of the plebeian order. But it is not the shortcomings of Bushido which have impressed the nation, but its practical precepts. What is deficient and defective in this moral régime can be remedied and supplied by the growth of democracy, which is irresistible, whereas the qualities it has impressed upon the nation are such as cannot easily be promoted by democratic institutions. To give a few of the more prominent moral sentiments particularly cherished by Bushido, we will briefly describe its sense of honor.

In Japan it is more usual to employ the word *renchi-shin* (literally, the sense of shame) as equivalent to the sense of honor, which characterizes every repertoire of knightly virtues. The worst thing which could be affirmed of a samurai was that he knew not shame. The two conceptions of honor and shame are so intimately allied that they not only seem inseparable but the reverse and obverse of the same thing. Honor sounds like an accretion gained over and above one's ordinary lot, and shame savors of something of which one is deprived. Shame is a painful sensation which accompanies the knowledge of guilt. It is what Kant would call the natural and immediate punishment for one's own conscious commission of sin or omission of duty. It is the self-knowledge of disturbed moral equipoise, and the more perfect the balance the more sensitive is it to the slightest disorder. Shame is the most delicate index of moral health, and the bushi was required to distinguish what constitutes shame and to avoid it. Like the English word shame, *haji* means first of all a painful sensation excited by a consciousness of guilt or impropriety, in which case it was a spiritual experience of an individual, irrespective of his relation to others; but it also means, secondarily, reproach or contempt incurred from outside.

It may be asked by what standard was the guilt or innocence of a deed, involving honor or shame, to be decided. A deed or thought that in the least clouded the lustre of the immaculate mirror of the mind was forthwith deemed shame. This simple faith in human nature was accepted as an axiomatic truth, no attempt being made to demonstrate it philosophically or theologically. Shame, therefore, was not explained; it was to be felt and avoided. As to honor,—the opposite of shame,—it was identified with a good name, and hence with reputation and fame. The error into which young samurai fell so easily and so naturally was to confound these and to endeavor to acquire name—rather fame—by means of any sort. Hence emulation and rivalry sometimes went beyond the limits of commonsense and wisdom. Another danger to which samurai youths were exposed was a false sense of shame—*malus pudor*. Misfortunes which could be rationally explained, or in Western lands would be termed «acts of Providence,» were often construed as deeds for which the individuals concerned held themselves responsible, and so many a useful life found a self-sought end. We are disposed to think that the emphasis placed on conscience as the criterion for honor or shame, for virtue or vice, for good ar evil—sharing as it does the practical doctrines of Socrates and the mystic tenets of Jacob Boehme and George Fox—was on the whole a healthy and beautiful teaching to follow, being based on the very root of moral consciousness.

The exaltation of benevolence was a logical outcome of a practical accompaniment of a sense of shame. Malice would be fatal to the highest instinct of honor, benevolence alone being consistent with it. By benevolence it meant love commingled with pity and mercy, which one feels towards one's inferiors. It was *par excellence* a virtue of princes. They represented divine powers, ruling over their

subjects with authority derived from heaven. This theocratic idea explains the comparative beneficence of the feudal régime. Paternal government was also based on the assumption that the ruler mediates between heaven and man, and though weakness of the system is apparent, it must be borne in mind that absolutism and feudalism were largely built on moral principles. Benevolence, however, was not altogether to be confined to the rulers. Every samurai was to be mindful of it in his transactions with his inferiors, with the weaker sex and with weaker men—with defeated enemies. It was considered disgraceful in samurai to take advantage of the weakness of others. Strategy and *ruse de guerre* were of course entirely justified in warfare; but even then some warriors went so far as to give ample opportunities to their enemies for due preparation. In private life, too, benevolence and the gentle virtues—magnanimity, forgiveness, mercy and pity—were ever extolled as befitting the noble occupation of the samurai. «Superior men hate sins but not the sinner,» said Confucius. It may not be amiss to observe here that the religious instinct of Japan, as expressed in Shintoism, never invented a hell, though it looked for a spacious firmament as an abiding place for the souls of the dead. In fact it has rarely spoken of sin except as defilement or contamination.

As benevolence is a virtue which the superior observes towards his inferiors, it is largely that of a ruler to his subjects. As to the subjects themselves,—the samurai proper, —Bushido laid particular stress on what may be called the reverential virtues: namely, those which men should observe in their dealings with people above them, such as loyalty towards their lord and master, filialty to their parents, and, in the case of the woman, obedience to her husband.

Of loyalty it has been said that it is the most deeply implanted virtue of the Japanese race. To be faithful in serving the master was equivalent to loving the country with which he is identified. Patriotism and loyalty therefore are hardly separable in Japanese ethics. In the feudal period, loyalty meant faithful service to a daimyo, who in his turn owed allegiance to the Emperor. Percival Lowell has charged the Japanese with impersonality. In one sense he is right; in another he is quite astray. In no other code does personality preponderate as in Bushido. One may say that an anthropomorphic element dominates the precepts of Bushido. The samurai were men of action, speculation being either an intellectual pastime or a method of mental discipline, and they were interested in concrete things. They cared little for abstract principles which regulate the relations between lord and retainer; their concern was to serve their daimyo with all their soul and body. And yet it must be noted that in personally serving his master (a man in flesh and blood) the samurai was not required to be a slave, pandering to every freak or fancy of a despot. If he thought his lord wrong, faithful service demanded that he should lead him into the right path. An unscrupulous flatterer who made it his trade to satisfy the self-will of his ruler, gained no place «i' the story.» If all his admonitions and requests availed nothing he resorted to the last appeal of disembowelment.

Allied to loyalty was the virtue of filialty so often dwelt upon in the precepts of knighthood. Under the feudal régime, each samurai had to furnish a certain number of armed men according to the amount of revenue granted him by the daimyo. As each holder of a benefice, that is to say, each head of a family, was held responsible for military service, the family and not the individual was the social and political unit. Added to this fact was another, namely, the custom of ancestor worship. These two considerations made family relations, compact and rendered the chief of the family an important moral and social factor. If the Arab practice of polygamy is kept up not solely by amorous sentiment but from an economic motive, neither was the feudal integrity of a family maintained wholly by moral regard. Whatever may be the sociological aspect of filialty, upon it and loyalty is founded the entire fabric of Japanese morals. This explains the important rôle the father plays in the economy of a feudal society. Moreover, the conservative ethics imported from China, hallowed the traditional ancestor worship of the race and it is clear without further explanation what filial piety must mean in the moral system of Japanese feudalism. Few motives of action are stronger in the Japanese mind than the glorification of his family.

In comparison with the father, the mother was not counted a social or political unit, and this fact helped to enhance her value within the family. It is only reasonable to expect woman's share to be small in a militant society, such as feudalism produces. At the same time, when a father's service is largely concerned in the welfare of his lord and of the community, the government of the household and the education of the children are naturally left to the mother. This has been distinctly true among the samurai. The assistance rendered by woman to the general welfare, and more particularly to her husband, was called *naijo*—the inner help—the service hidden from unconcerned eyes. It was a work directly known and appreciated only by the members of the family and chiefly repaid by the sons in their filial love and pious remembrance. Hence, though little note was taken of woman's position in public, within the family it was not much inferior to that of the *pater familias*. Woman's influence in Bushido was largely exercised through her position as mother. The education of the samurai was in its earliest stages naturally left to her. And here it is important to note that, while among the diamyo concubinage was usual and the children, legitimate or illegitimate, were frequently reared by nurses, the samurai could ill afford to keep mistresses and the bringing up of their children was considered the proper work of the mothers. This explains the general superiority, both physically and intellectually, of the samurai over the daimyo.

A point of great moment in the education of the samurai youth, was the inculcation of courage, bravery and fortitude. The arts of war and the technique of warfare were of much less importance than the mental and moral aptitude of the fighters. When two

combatants confronted each other on the field, the question was not which party should win, but who would prove himself the braver—even though defeated. Children were therefore taught to admire daring deeds and deeds of endurance. In the pedagogics of Bushido, children were often subjected to severe tasks, in order to inure them to hardships. The pangs of cold, of hunger, of fear or dread, were almost systematically imposed upon them. They dared not shirk sorrow or pain. How could they when honor might at any time require them to commit *seppuku*,—disembowelment?

In Japanese anatomy, the *hara*, which is the comprehensive region between the breast and pelvis—including the stomach, gall-bladder, spleen, liver and intestines, was believed to be the seat of the soul. This view was shared by the Greeks who used the terms *thumos* and *phren* for the same part of the body, and also by the Hebrews, who looked upon the bowels as the seat of passion and compassion. We know that there are important ganglia in the abdomen and how susceptible they are to any emotion. The custom of splitting the abdomen, though it may at first seem ridiculous, came from the idea that if one's spirit resides there, one can show by disemboweling himself his innermost thoughts and the motives which actuated him. Seppuku was thus thought the most honorable mode of ending one's life and was therefore confined to the samurai class. It is a great mistake to look upon it merely as a process of committing suicide. It was sometimes imposed as a legal punishment in which case there was no actual cutting of the abdomen, but decapitation by a *kaishaku*, who was often the friend of the condemned. Disgrace of the father, that is of the family, name, is of all things the hardest for a samurai to endure.

The training of a samurai was no light work. Indeed his whole career was far from being smooth and easy. Constant vigilance was the price of his status. If fighting had been his only vocation, we might have had a quarrelsome, bloodthirsty animal, and such a type was not wholly wanting, though it was despised as that of a «boar»-samurai. When it existed it was chiefly found among the young, and it was exactly this rude type with its haughty, swaggering manners, which attracted the notice of foreigners. But this low type was far from the ideal of Bushido. Intellectual culture combined with a strong will, refinement of manners that would not sink into effeminate mannerism or obsequious conventionality, superiority in the two accomplishments of war and peace, of military and literary arts. (*Bun-bu Ryo-do*), was the goal aimed at. In speaking of the ideals of Bushido one cannot help calling to mind the guardians of Plato. It is not by accident or jest that Mr. Wells has chosen the name of samurai for an ideal social class in his 'Modern Utopia.'

Striving after an ideal, imperfect as it may have been, the life of a conscientious samurai was a strenuous one, and so in popular literature his lot was often bewailed: for, like all wholesome moral systems, Bushido taught more of duties than of rights. The samurai had few rights above the commonalty, and what rights they enjoyed did not amount to any substantial benefit. If he had a desire for wealth, a merchant's lot could better secure this. If his inclination were for mere pleasures, he might well envy a tradesman. If his taste lay in literary ease, religious retirement would assure him that. Luxuries he had to forego and even his pleasures were regulated. In spite of some degree of laxity which public sentiment tolerated, the strict régime allotted him only a certain kind of dance, of music and of pastime. The two swords which it was the privilege of the samurai to carry, served more as a reminder of the dignity and responsibility of his calling than of its privileges.

9. Japan — Education. *Introduction.* — In 270 A.D. the king of Korea sent his ambassador to the imperial court of Japan. This led to the adoption of the Chinese learning, which, for more than 1,000 years, was the most important factor in the Japanese educational system. From time to time Japan sent special missions and students to China for study, while many Chinese and Koreans went to Japan and were naturalized.

With the advent of Chinese learning Confucianism soon became the foundation of Japan's moral and literary education. About this time Buddhism also entered the country. It found devout adherents at the court, and priests went in large numbers to China to study Buddhism and its literature. Out of the joint influence of these two, her social refinement was attained. Early in 701 A.D. we find an educational system laid out in the Taiho Statute.* A state university was founded in the capital, Kyoto, and provincial schools were established in the provinces, while powerful families in the provinces founded private schools to educate their own children and those of their relatives and retainers. It was maintained that the basis of all good actions lies in filial piety, and copies of 'Kōkyo,' or the 'Treatise on Piety,' were distributed throughout the empire and every home had a copy. Thus moral education was encouraged. At this epoch literature also flourished among the women of high class. But the pen was soon obliged to give way to the sword. The powerful families in the provinces waged war upon each other, while at the court people passed most of their time in composing effeminate poems, and seldom cared to enter deeply into the study of literature. On the other hand, the military class had no spare time to devote to learning, and literature became the sole monopoly of the priests. They taught their neighbors' children in the an-

*Name of the era.

nexes to the temples, hence came the word «Terakoya,» or children's house of the temple, which institution survived even until the establishment of the modern elementary schools.

In 1603 A.D. Tokugawa Iyeyasu founded the Bakufu or Shogunate in Yedo. When peace was restored, he encouraged arts and learning. In 1691 A.D. Tsunayoshi, the fifth Shogun, founded a college which was the origin of the «Shoheiko,» the highest seat of Chinese learning in Yedo. Distinguished scholars came out of this school and literature again prospered. Feudal lords in the provinces, following the example of their feudal chief in Yedo, also set up schools for the sons of their retainers. These may be called the public schools of the time. There were also many private schools established by scholars on their own account, who taught young men Chinese classics. These schools, it must be remembered, chiefly taught the doctrines of Confucius and Mencius, together with literature and history. «The common people need not be profoundly taught; they should be made chiefly to rely upon the rulers,» was the educational policy of the government. But after the middle ages, the Terakoya prospered and was free to all. During the régime of Tokugawa, peace continued for more than 250 years, which led to the rapid development of *belles-lettres*. The pure Japanese literature, rivalling the Chinese classics, began to gain much attention, and it soon made wonderful progress and attained a height heretofore unknown. The intercourse with foreign countries became more frequent under the early Tokugawas and by the study of the Dutch language the enlightenment of the West was introduced into the country. Many people studied medicine, physics, chemistry, etc., together with the foreign military science. Later, the Bakufu itself established in Yedo an institution called the «Bansho-torishirabe-sho,» the Place for Investigating Foreign Books, and also a medical school called the «Igakusho,» *i. e.* the Place for Medical Study, which gave a great impetus to the study of Dutch. Towards the close of the Tokugawa régime, some began to study English and French books also, while others went abroad for study by the order of the government and in unauthorized cases ran away from the country for the same purpose. In short, learning which had declined during the middle ages again prospered during the Tokugawas, and besides the prosecution of the Chinese literature and philosophy, there arose gradually a new field of the western science, producing many distinguished scholars even among the common people.

In 1867 A.D. the Shogunate came to an end, which led to the restoration of the imperial power. All institutions, and especially the system of education, were radically reformed. In 1872, the «Gakusei,» *i. e.* the Educational Code, was promulgated. The basis of the new system was laid. The empire was henceforth to be divided into eight university districts, each one of which was divided into 32 middle school districts, while each middle school district was again subdivided into 210 elementary school districts; and the schools of the corresponding grade in each district were to be established. But it was found that this system could not be well carried out in its entirety, and many revisions of the ordinances relating to universities, normal schools, middle schools, elementary schools, etc., had to be decreed, but no fundamental changes have taken place since that time. In 1890, the ordinance for the elementary schools was revised and a system of compulsory education was adopted. On 30 Oct. 1890, the Imperial Rescript with regard to education was proclaimed and the moral basis of Japanese national education was definitely settled. The English version of the Rescript reads as follows:

KNOW YE, OUR SUBJECTS:

Our Imperial Ancestors have founded Our Empire on a basis broad and everlasting and have deeply and firmly implanted virtue; Our subjects ever united in loyalty and filial piety have from generation to generation illustrated the beauty thereof. This is the glory of the fundamental character of Our Empire, and herein also lies the source of Our education. Ye, Our subjects, be filial to your parents, affectionate to your brothers and sisters; as husbands and wives be harmonious, as friends true; bear yourselves in modesty and moderation; extend your benevolence to all; pursue learning and cultivate arts, and thereby develop intellectual faculties and perfect moral powers; furthermore advance public good and promote common interests; always respect the constitution and observe the laws; should emergency arise, offer yourselves courageously to the State; and thus guard and maintain the prosperity of Our Imperial Throne coeval with heaven and earth. The way here set forth is indeed the teaching bequeathed by Our Imperial Ancestors, to be observed alike by Their Descendants and all subjects, infallible for all ages and true in all places. It is Our wish to lay it to heart in all reverence, in common with you, Our subjects, that We may all thus attain to the same virtue.

The 30th day of the 10th month of the 23d year of Meiji.

(IMPERIAL SIGN MANUAL. IMPERIAL SEAL.)

This Rescript is the foundation of the moral education of the Japanese people. After the new educational system «Gakusei» was established and its details proclaimed, many foreign scholars were employed and a great number of students were sent abroad to study. Japan now naturally entered a transition period which blindly welcomed new ideas and as blindly dispensed with old ones. Some radical followers of the new learning espoused the American utilitarianism which they half understood, while others loudly advocated the French idea of liberty. Then came the German system of philosophy and methods of education. To oppose these tendencies there arose the «Kokusui hoson shugi,» *i. e.* the principle of preserving the country's traditions. In the midst of darkness and confusion which these conflicting elements occasioned and enhanced, appeared the above Rescript, which set at rest much of public anxiety and enlightened the educational world.

One great advantage of Japanese education is its complete separation from religion. Any conflict on this subject is unknown. In 1899, the Minister of Education issued an instruction to the effect that all government and public schools as well as those schools the curricula of which are fixed by ordinances, should teach no religion whatever in the school hours or even outside of them. This instruction made the separation between education and religion complete.

Ever since the restoration, the whole nation has striven to advance education, in spite of incessant political troubles, civil and foreign wars. The improvement not only in the equipment of schools, but also in the personnel of the teaching staff, is continually being made the object of special attention by the Department of Education. The following table shows the gradual increase of pupils and students in different scholastic institutions:

Kinds of Schools.	1906	1902	1897	1892
Elementary Schools	5,348,213	4,980,604	3,994,826	3,165,410
Blind and Dumb Schools	1,433	797	313	198
Middle Schools	104,968	88,391	52,671	16,189
High Schools for Girls	31,918	17,540	6,699	2,803
Colleges	4,904	4,361	2,679	3,070
Imperial Universities	5,821	3,612	2,255	1,308
Special Schools	25,054	17,888	11,729	9,428
Technical Schools	165,125	36,656	19,932	4,335
Normal Schools	18,924	17,982	8,830	5,357
Higher Normal Schools	960	531	473	80
Higher Normal Schools for Girls	361	331	171	84
Special Institutes for the Training of Teachers	154	.....	.....	.....
Institutes for the Training of Technical School Teachers	175	131	99	.....
Miscellaneous Schools	133,292	96,184	68,040	77,448
Total	5,841,302	5,265,008	4,168,717	3,285,710

If classified according to the nature of instruction given, Japanese education may be divided into three distinct parts, viz., general, special, and technical. If classified according to the grade, it comprises the three degrees of elementary, secondary, and higher education. General education consists in teaching of such subjects as are essential to the people as a whole. It is given in schools belonging to the elementary and secondary grade, such as the elementary schools, other schools of a similar grade, kindergartens, normal schools, middle schools, high schools for girls, other schools of a similar grade as the two preceding, higher normal schools, etc. Special education consists in the teaching of the advanced sciences and arts and constitutes mostly the domain of higher education, including the universities. Technical education consists in the teaching of all those sciences and arts necessary for preparing the pupils in trades, agriculture and industries. The technical schools which belong to the elementary grade are the supplementary technical, the apprentices', agricultural and commercial schools of the lower grade. Those which belong to the secondary grade are agricultural, commercial and industrial schools of the middle classes, while higher industrial, higher agricultural or higher commercial schools come under the head of higher education.

Educational Administration.—The highest central authority which directs the affairs relating to education is the Imperial Department of Education. Since 1871 it has its seat in Tokyo and constitutes one of the nine departments of the Imperial Japanese Government. The Minister has entire control of all educational matters of the Empire, except those placed under other departments on account of special reasons. For instance, the Peers' School is under the control of the Imperial Household Department; Military and Naval schools under the Departments of Army and Navy; Schools for Mercantile Marine, for Post and Telegraph are under the management of the Minister of Communications; while all schools in Formosa are controlled by its Governor-General under the orders of the Minister of Interior. The Minister issues the departmental ordinances, instructions, etc., in exercising his administrative powers.

As the assistant officials of the Minister there are a vice-minister, three heads of bureaus, councillors, a private secretary, secretaries, inspectors, examiners of school books, compilers, technologists, clerks, etc. The three bureaus are styled respectively the General, the Special, and the Technical. The secretariat of the Minister is divided into five sections, viz., those of private secretary, drafting, accountant, school books and charts, and architecture, and each section has a director who is generally one of the secretaries. The vice-minister assists the Minister in managing the affairs of the department and has the immediate superintendence of the works of the different bureaus. Each head of the bureau takes the charge of his own bureau and is responsible for its affairs. The Bureau of Special Education takes charge of the affairs relating to higher education; the Imperial universities, high schools, special schools, the Imperial Academy, the government library, museums, etc., coming under its control. The Bureau of General Education takes charge of the affairs relating to general education; normal schools, middle schools, high schools for girls, elementary schools, kindergartens, schools for blind and dumb, educational associations, etc., are under its surveillance. The Bureau of Technical Education takes charge of the affairs relating to technical education; industrial schools, agricultural schools, commercial schools, apprentices' schools, supplementary technical schools, etc., being under its cognizance. For the purpose of inspection, five regular inspectors act for the Minister. Their duties consist in inspecting the state of education throughout the country, but while they are in Tokyo they also serve in the different bureaus and assist in managing their affairs. The whole country is divided into five inspecting districts, having each one inspector who sees to the affairs of his district. They generally change the district in their charge once in every two years. They inspect the condition of educational administration and the state of school education, hygiene and finance, etc., giving such advice and instruction as may be necessary. During their tour they submit to the consideration of the Minister any question calling for speedy action, and when they return at once report to the Minister orally, and within a month send in a written memorandum. Besides these permanent inspectors, there are professors in higher and other schools, etc., who are provisionally charged with additional and special duties of inspectorship on particular subjects.

The Superior Council of Education which exists in virtue of the Imperial decree of 1898, discusses weighty questions on education submitted to them by the Minister, or they may submit their views on education to the Minister. Its members consist of directors of schools, administrative officials who have either directly or indirectly some relation to education, scholars and men who have had experience in the work

of education. Under the superintendence of the Minister there are also several standing commissions for special matters. For instance, the Commission for Examining the Qualification of Teachers has the charge of testing and examining the candidates who wish to become teachers of normal, middle, or high schools, etc. The Japanese Language Investigation Commission has been instituted for the purpose of investigating subjects relating to the Japanese language, and has for its principal aim the improvement of the mother tongue. As can be inferred from its historical changes the Japanese language has been greatly influenced by Chinese literature; and the fact that it was largely written with Chinese characters has caused a great difference between the spoken and the written language. The improvement of the language is therefore an important question. The Board of Seismology investigates and experiments to find the best suitable construction for guarding against the effects of earthquakes, and pursues scientific investigations for predicting earthquakes. The Board of Geodesy manages affairs connected with the International Geodetic Society and investigates various subjects bearing on geodesy. The Special Observatory for the Measurement of Latitudes is occupied with affairs connected with the measurement of the variation of latitudes in accordance with the contract entered into between the government and the International Geodetic Society. The Commission for the Compilation of Catalogues of Scientific Literature conducts the affairs connected with the International Committee organized for the same purpose. The Commission for the Examination of Medical Practitioners takes upon itself the work of periodical examination of physicians. A similar commission exists for the Examination of Pharmaceutists. The aim of the Imperial Academy is to promote the advancement of the sciences and arts and gives assistance in propagating the salutary influence of education in general. It has 60 members, chosen from among the most distinguished men of learning; foreigners who have rendered special service to science and art are made honorary members. Besides these the Minister has the control over the Imperial Library and the Central Meteorological Observatory.

The principal local instrument of education is the Governor. The whole empire with the exception of Formosa is divided into one Do, three Fu and 43 Ken, each of which has a local governor. Each governor takes charge of administration of his locality. All Do, Fus and Kens are local administrative districts and are at the same time self-governing corporations. Each governor has inspectors under him who attend to school matters under his jurisdiction and is mainly responsible for the expedition of educational affairs. Fu and Ken are divided into Gun, and each Gun has its chief official called «Guncho,» who is in turn assisted by an inspector on matters relating to schools. Cities, towns and villages are also self-governing corporations, and have a mayor or a headman. The mayor or headman manages the educational affairs relating to cities, towns and villages, respectively. It is designed that a school committee should exist in every Fu, Ken and Gun, as well as in every city, town and village, but at present they exist only in cities, towns and villages. The local governors specially appoint school physicians for every public school, but at present those schools established by villages, as well as those of poorer districts with a population of less than 5,000, may be exempted.

PRIMARY EDUCATION.

Elementary Schools.—The government began to take serious notice of national education after the Imperial restoration (1868). Previous to that people who wished their children taught, sent them to «Terakoya,» where they obtained the rudiments of knowledge, as already mentioned. In 1872 the «Gakusei,» or the Ordinance for Educational System, was issued, and elementary schools were established, part of the expense being borne by the State. In 1879 this ordinance was replaced by another called the «Kyoikurei,» or the Ordinance of Education, which was again revised in the following year, and also again in 1884. The Kyoikurei was followed in 1886 by the «Shogakkorei,» or the Ordinance relating to Elementary Schools. Thus the basis of the present educational system was gradually laid. In 1890 further revisions were introduced, and in 1900 the present system was adopted, which was also partly revised in 1907. The aim of the elementary schools is to teach the foundation principles of moral and popular education, giving such knowledge as is essential for life, care being also taken to develop the physique of the children. Religious teaching having no place in the Japanese system, the foundation of the general education consists of the moral, the intellectual, and the physical training. There are no preparatory schools in addition to the middle schools, as in some countries. Hence everybody, rich or poor, high or low, must first enter the elementary school. Thus the Japanese elementary schools give, in the strictest sense of the term, the national education. The only exception to the rule is found in the Peers' School where the boys of the high classes are taken.

Elementary schools are divided into two kinds, viz., the ordinary, and the higher. The former has a course which extends over four years, while in the latter the course varies from two to four. Compulsory education is enforced in the elementary schools. Four years compulsory education has proved insufficient and the government has recently prolonged this period by two years, thus making compulsory education to last six school years. In the higher elementary schools a more advanced grade, or in other words continuation of the ordinary elementary school course, is given. A considerable portion of the elementary schools have both of these grades. All elementary schools may have a supplementary course. The course must not run for more than two years, and the subjects, and the season of the year in which they may be taught, are determined according to the requirements of the locality. Unlike the system of some German states, these courses are not yet compulsory. Cities, towns and villages must all establish their own ordinary elementary schools. But if a self-governing corporation is too poor or there exists some special reasons against establishing its own school, the education of its children may be entrusted to other

corporations, or it may have a school in common with some others. Higher elementary schools not being compulsory are generally established by self-governing corporations on the approval of their local governors. Private persons can also establish elementary schools on the same condition. The school age begins at the sixth and continues to the end of the fourteenth year. Attendance at school commences at the beginning of the school year after the children reach their sixth year, and ends with the completion of the ordinary elementary school course. Guardians or those who exercise the parental right are required to send children to public elementary schools until they finish the ordinary course. If they wish to have the children taught at home or in private schools, they must first apply for permission to the authorities. In no case, except the absolute poverty of the guardian or the idiocy, deformity or illness of the children may they be excused from these responsibilities. Children still in the age of compulsory education may not be employed to the neglect of their education. According to the latest statistics 97 per cent. of boys and 93 per cent. of girls of school age are studying in schools. Formerly the custom was not general among the common classes to educate girls, but guardians are now beginning to see the need of educating the girls as well as the boys.

TABLE SHOWING THE PERCENTAGE OF SCHOOL POPULATION RECEIVING THE PRESCRIBED COURSE OF INSTRUCTION.

	Boys.	Girls.	Boys and Girls.
1905-6.....	97.72	93.34	95.62
1904-5.....	97.16	91.46	94.43
1903-4.....	96.59	89.58	93.23
1902-3.....	95.80	87.00	91.57
1901-2.....	93.78	81.08	88.05
1900-1.....	90.55	71.90	81.67

The subjects taught in the ordinary elementary course consist of morals, Japanese language, arithmetic, and gymnastics. Such subjects as drawing, singing or manual work may be added, according to the choice of the locality. For girls, sewing may be added. The subjects taught in the higher elementary schools are morals, Japanese language, arithmetic, Japanese history, geography, science, drawing, singing, gymnastics. For girls sewing is added. If the higher course is only two years, either science or singing or both may be left out, and manual work may be added. If the course runs for three years or more, singing may be omitted and manual work added for girls, while for boys manual work, rudiments of agriculture or commerce may be given. In such a case the boys are made to choose one of these extra subjects. If the course runs for four years, English language may be added. All these additional subjects may be optional. In the new six years compulsory system the subjects of both the ordinary and the higher elementary schools have been somewhat changed. If any subject in the regular course is found unsuited to the physical condition of a child, he may be excused from it. As regards the curriculum above mentioned, a provision which minutely explains how each subject should be treated is found in the Regulation for Carrying Out the Imperial Ordinance relating to Elementary Schools. For instance, morals are taught with the Imperial Rescript as the basis, the aim being to form good character and to induce the pupil to act in accordance with moral precepts. It is begun with lessons on filial piety and brotherly love, friendship, diligence and frugality, respect, faith and justice, courage, etc., and the children are gradually led to understand the general duty and obligations to the country and to society. At the same time care is taken to elevate their character, to strengthen their will, to cultivate their enterprising spirit and encourage their love for public virtues as well as their spirit of patriotism and loyalty. For girls such virtues as chastity are specially explained. Wise sayings, exemplary deeds, proverbs, etc., are made use of to warn as well as to edify them. Since the olden times, moral education has always been pursued with much attention in Japan, and now, the spirit and the teaching of the Imperial Rescript has become the fundamental principle of Japanese life and pervades every home throughout the Empire. The school year of elementary schools commences on the first day of April and ends on the last day of March of the following year. On the anniversary of the accession of the Emperor Jimmu, the present Emperor's birthday, and on New Year's day, teachers and children assemble in the school to celebrate the occasion and generally employ the day to promote moral instruction. First they sing the «Kimigayo,» the national anthem, salute most politely the photographs of the Emperor and the Empress, and the director reads the Imperial Rescript. In public schools of ordinary elementary grade established by cities, towns and villages, tuition fees cannot be generally charged. In special cases, however, a small amount is charged after permission is obtained from the authorities. As compulsory education obliges even very poor people to send their children to school, it is proper that all expenditures should be borne by the corporations. In higher elementary schools tuitions can be charged.

Kindergartens.—A kindergarten after the pattern of Froebel was first established in Tokyo in the Higher Normal School for Girls. Now the number reaches as many as 313. The object is to train children of three years and upward, until they reach their school age. These institutions are to help to complete home education in the sound development of the mind, the body and of good habits. The subjects of training consist of games, singing, conversation and hand work. The kindergartens are frequented mostly by the children of middle or high classes. Such kindergartens as are prevalent in Europe and America where poor children are kept and trained, are yet few in Japan. Competition of life among the lower classes is not so great as to leave parents destitute of means for training and bringing up their children.

Schools for Blind and Dumb.—In schools for the blind and dumb general education is imparted. The grade is that of elementary schools, but there is a professional course which aims to enable them to earn their own living. These institutions, together with kindergartens, come under the Imperial Ordinance relating to Elementary Schools. The education of the blind and dumb has not kept pace with the progress

made in other spheres of education, but the government has shown a disposition in recent years to give more attention to the development of this work. The Tokyo School of Blind and Dumb is a government institution. The school is divided into ordinary and professional courses. In the ordinary course Japanese language, arithmetic, conversation and gymnastics are taught, and in the professional course music, acupuncture and massage. The ordinary course for the dumb includes reading, composition, arithmetic, written conversation and gymnastics, and in the professional course drawing, carving, joinery and sewing. There is also a training course for teachers.

SECONDARY EDUCATION.

Middle Schools.—Secondary education is conducted in the middle schools for boys and the higher schools for girls, and consists in giving pupils the knowledge and arts essential for the middle classes of society, and also prepares them for special education. Their equivalents are found in the secondary schools of England, lycée of France, gymnasium and hoehere maedchenschule of Germany. In Europe and America the schools where secondary education is given have for the most part preparatory departments of their own, while the Japanese middle schools or high schools for girls have none, the elementary schools acting as preparatory institutions.

The middle school deals with intermediate education coming between the university and the elementary school. After several revisions the present ordinance for the middle school was issued in 1899, and departmental regulations for carrying it out were enacted in 1901. The Hokkaido as well as each Fu and Ken must establish at least one middle school. The Minister of Education can order Fu or Ken to establish middle schools when he deems it necessary to do so. Cities, towns and villages can found their own middle schools if they do not impede in any way the progress of the elementary schools. Private individuals may set up middle schools also.

Boys of 12 or older, and who have passed the second year of their higher elementary course or have similar attainments, are qualified to enter the middle schools. But the increase of these schools, though remarkable, having trebled during the last 10 years, does not afford sufficient accommodation and the applicants have to be admitted by competitive examination. The course extends over five years and a post-graduate course of under two years may be added. The school year begins on the 1st of April and ends on the 31st of March of the following year. The number of school days must be over 200 in a year. The number of pupils must not exceed 400. In some particular cases it may be increased to 600. The maximum number of pupils in one class is 50. The subjects taught are morals, Japanese and Chinese, foreign language, history, geography, mathematics, natural history, physics and chemistry, rudiments of political economy and law, drawing, singing and gymnastics. The foreign language may be either English, German or French, but at present the language taught is practically English. Rudiments of law and political economy and singing may be omitted for the present. The programme of every subject is fixed, as it is in the case of elementary schools. The Imperial Rescript is the basis of morality here as elsewhere. Moral principles that may form a character suitable for the middle or higher class of society are taught here. The teachings of Confucius and Mencius which enforce piety to parents and loyalty to the sovereign have been firmly rooted for over 1,000 years in Japanese homes. Bushido* is also an effective teaching for inculcating high moral standards and is freely referred to in these classes.

The textbooks are chosen by the director among the works approved by the Minister of higher grade. Besides they are entitled to get the governor's sanction before he can adopt one. If the director deems it desirable to use a book which has not yet received the approval of the Minister, the governor may sanction its use provisionally if the Minister gives the permission.

The pupils, while they are in the school, are exempted from military service, and when they graduate they may join the army as one-year volunteers. The middle schools not established by either government or local bodies have not these rights, unless they are so approved by the Minister of Education. Graduates from middle schools established by the above two authorities have the qualifications to be appointed under-officials. Graduates of any middle school may apply for admittance to any special school of a higher grade. Besides they are entitled to get a license without examination to become elementary school teachers. This middle school or liberal education is recognized as the indispensable basis for entrance to all higher national institutions of learning.

High Schools for Girls.—The general education of women, as already stated, began with the Restoration. It is true Japan has produced many distinguished women scholars who have left immortal names in the field of literature, as well as in other spheres of life, but as a rule under the old régime among the common classes women's education was looked upon as a matter of no great moment. In the early stages of the new system, girls were comparatively few who followed the prescribed course of education in the elementary schools, in spite of the effort of the department. To encourage woman's education the department founded girls' schools in Tokyo and also sent girls abroad for study; but in consequence of the conflict between the old and the new ideas the education of girls did not receive such hearty response from the public as in the case of boys. Within the last decade, however, public feeling toward the education of women has radically changed, the people have come to attach almost, if not equal, importance to the education of their daughters to that of their sons. The daily attendance of girls at elementary schools is 93 per cent., while that of boys is 97 per cent. of those of school age. The middle classes now consider it indispensable to send their daughters to the high schools.

At first, the provision for girls' schools was included in the Ordinance relating to middle

*See Prof. Nitobe's work on 'Bushido.'

schools, but in 1895, they were made the subject of special regulation, and in 1899 the Ordinance for High Schools for Girls now in operation was issued. The aim of the girls' schools, corresponding to the middle schools for boys, is to give the pupils an advanced grade of general education; the aim in the education of women is primarily to make good wives and wise mothers. In this respect the prevailing opinion is not unlike the German. The American ideas of giving university education has as yet no place in the Japanese public educational system.

The course of study, which extends over four years, may be prolonged or shortened by one year. In addition to the regular course, however, a supplementary course not exceeding two years may be provided, so that the girls may study during seven years where the longest course is open. For the benefit of those who wish to study such arts as are necessary for women, a special course may be established. A special course may also be instituted for those graduates who desire to pursue special branches of study. The regular course consists of morals, Japanese language, foreign language, history, geography, mathematics, sciences, drawing, household management, sewing, music, and gymnastics. Foreign language, which may be either English or French, may be omitted, or may be made optional. Music may also be omitted for those who have no aptitude for it. A study of pedagogy or of arts or both may be added as optional subjects. In a school of shorter course no such optional subjects can be provided. The subjects taught in the supplementary course may be chosen from those taught in the regular course. The special art course extends over two or even four years. The subjects are morals, Japanese language, mathematics, science, drawing, household management, music, gymnastics, besides useful arts for women. But mathematics, science, and drawing may be made either optional or be omitted. As to music, it may be left out for those who have no ability. The special course for the graduates extends over two or three years. Graduates may receive certain favorable treatment when they apply for the qualification of elementary school teachers. Other regulations are similar to those of the middle schools and the provisions in the Regulations for Carrying Out the Ordinances for Middle Schools are generally adopted for use here also.

HIGHER EDUCATION.

High Schools.—Higher education is given in the universities and special schools. There are also a number of schools called high schools or Koto Gakko. They are not in themselves complete institutions of higher education, but simply teach preparatory courses for the universities. In some respects they may correspond to the colleges in America. In Europe and America those who complete their secondary education can at once enter universities, as well as higher technical schools. But in Japan, the high schools which prepare the pupils for the universities intervene between the universities and the middle schools. Each high school is divided into three departments. The first department teaches preparatory course for those who enter the colleges of law, and literature; the second department for those who wish to study the course of pharmacy, or enter the colleges of engineering, of science and agriculture, while the third department prepares those desirous of entering the college of medicine. In these schools, special attention is paid to the teaching of foreign languages and more hours are allotted to them than to other subjects. If the middle schools were efficient enough to give general education of the standard required by the universities the *raison d'être* for these institutions would disappear. But the three years of high school education does much good in the way of building up the boys' physique and character, as well as in giving a more advanced knowledge of foreign languages. The languages taught are either English, German or French. During the time they are in school pupils are exempt from military service, and graduates have the privilege of joining the army as one-year volunteers. They also receive favorable treatment at the state examinations for middle school teachers.

IMPERIAL UNIVERSITIES.

Although universities, broadly speaking, are not new institutions in Japan, yet the Imperial universities as they exist at present owe their origin to the Bansho-Torishirabe-Dokoro of the Bakufu, instituted toward the end of the Tokugawa period. After the Restoration the institution was reëstablished by the government under the name of the Kaiseijo, or the Place of Enlightenment. The Tokyo Medical School, which afterwards formed the Seiyo-Igakujo of the Bakufu, together with the institution above cited, formed the nucleus of the Tokyo University, which came into existence in 1877 and comprised the faculties of Law, Science, Literature, and Medicine. In 1885 the school of law, which hitherto had been carried on by the Department of Justice to meet its own requirement, was also incorporated into the faculty of law. In the same year, the College of Engineering, similarly under the control of the Department of Public Works, was also taken over by the Department of Education, as the former was abolished. In 1886, the ordinance relating to the Imperial University was issued, and the former Tokyo University and the College of Engineering carried on their work under the new name of the Imperial University. In 1890, The Tokyo School of Agriculture and Forestry, which had been under the auspices of the Department of Agriculture and Commerce, was transformed into a college of agriculture and added to the Imperial University of Tokyo. Thus the Imperial University of Tokyo now includes the six faculties, viz., those of law, medicine, engineering, literature, science, and agriculture. In 1897, another university was created in Kyoto, and is now complete with four faculties of law, medicine, science, and engineering and literature. Unlike the universities of the west they have no theological department. The Japanese government in the budget of 1907, authorized the creation of two new independent universities, one in the north and one in the south of Japan. The ordinance relating to Imperial Universities regards them as institutions established for the purpose of instruction in the sciences and arts indispen-

sable to the State, and of conducting independent research in the various branches of learning. The President of the university presides over the whole institution. The head of each faculty takes charge of the affairs relating to his college. The university council is formed from the heads of faculties and one professor out of each faculty. The President calls its meetings at any time and acts as the chairman. The council discusses matters concerning the course of study, establishment of chairs, and the internal regulations of all the faculties, conferring of degrees, and also other matters submitted to them either by the Minister or the President. It can also lay its views to the Minister of Education, regarding matters of higher education. Sometimes the title of an honorary professor is bestowed, by command of the Emperor or by the proposal of the Minister of Education, upon those who have rendered meritorious service to the university or have made some achievements in science deserving of special honor. In every faculty there is an Assembly of Professors consisting of all professors of the faculty. It discusses the curriculum, examinations, conferring of degrees, and other subjects submitted to them either by the Minister or by the President. The business officials of the university are the secretary, the superintendent of the students, clerks, etc. The faculty courses of the two universities are as follows:

The Faculty of Law: In Tokyo the courses are law and politics. Kyoto has but one course, that of law.

The Faculty of Medicine: In Tokyo the courses are medicine and pharmacy. Kyoto has no course of pharmacy.

The Faculty of Engineering: In Tokyo the courses are (1) civil engineering, (2) mechanical engineering, (3) naval architecture, (4) technology of arms, (5) electric engineering, (6) architecture, (7) applied chemistry, (8) technology of explosives, (9) mining and metallurgy. In Kyoto the courses are (1) chemistry, (2) applied chemistry, (3) civil engineering, (4) mechanics, (5) electric engineering, (6) mining and metallurgy.

The Faculty of Science: In Tokyo the courses are (1) mathematics, (2) astronomy, (3) pure physics, (4) experimental physics, (5) chemistry, (6) zoölogy, (7) botany, (8) geology.

The Faculty of Literature: In Tokyo the courses are (1) philosophy, (2) history, (3) literature. Kyoto has also the same courses.

In the Faculty of Agriculture in the Tokyo University, the courses are (1) agriculture, (2) agricultural chemistry, (3) forestry, and (4) veterinary science.

The time of study required in each faculty varies from three to four years. In matters of discipline much freedom is allowed to the students of the university, it being taken for granted that they have already the firm basis of moral culture. The results of investigations of the professors and students are published in the journals of the faculties. The equipment of the universities, although much remains yet to be done, compares favorably with similar institutions abroad. An astronomical observatory is attached to the College of Science, and a special bureau for Compilation of Historical Materials is attached to the College of Literature. There are also botanical gardens, marine laboratories, hospitals, experimental farms, forestry stations, etc. The universities have contributed much towards the welfare of the nation.

SPECIAL SCHOOLS.

In 1903 the ordinance relating to the special schools was issued, and those schools which give instructions in some particular branch or branches of science and art, were all called Special Schools and come under this ordinance. Most of the special schools are established by the State and are government institutions. The public corporations such as Fu, Ken, and city, or private individuals may found special schools. Persons who have completed the prescribed course of instruction in the middle schools, or in the high school for girls, with course extending over four years or more, or who possess equal or higher attainments are qualified to enter. Special schools have a course extending over three years or more. Since the special schools give instruction of high grade to young men who have finished secondary education, the State gives the graduate special privileges, as for instance, the graduates from the special school of medicine can practice without any examination and those who have passed through the special school of literature can at once obtain a license of a middle school teacher. Some of the special schools in Japan may be considered as corresponding to the university of lower type found in the United States and elsewhere; they discharge the functions generally belonging to the latter institutions.

There are but a few special schools in which girls may be admitted. Among the Government schools the Tokyo Academy of Music and among the private schools the Women's College at Waseda are the only places where women can attend.

TECHNICAL EDUCATION.

Confucianism taught a sublime doctrine which made the people esteem transcendent philosophy and little attention, if at all, was paid to what corresponds to modern utilitarianism. Besides, under the old régime it was considered that farming, trade and industry needed nothing but experience and that business men would not gain much by study. But with the change of the times, and the participation of Japan in the commerce and industry of the world, the establishment of technical education became essential, and the Department began to encourage it by founding the system of supplementary technical schools, apprentices' schools, by teaching subjects which have reference to industry in the elementary schools, and also by establishing other higher technical schools. In 1894, the Law of Granting State Aid to Technical Schools was enacted, and 150,000 yen was annually paid out of the state treasury for this purpose. It was subsequently increased to 365,000 yen. Measures have been taken to train teachers for these schools. In 1899, the Ordinance for Technical Schools was issued. Its purport is to provide education essential for those who pursue agriculture, commerce and industry. In all Fu, Ken, as well as in Hokkaido (all administrative districts) technical schools may be estab-

lished, and the Minister of Education can order any of them to found a technical school or schools according as the condition of the locality requires them. Any Gun, city, town or village may also establish technical schools if the locality requires them, and if at the same time they do not impede the progress of elementary school education. A chamber of commerce or private individual may also found technical schools. A technical school whether public or maintained by a business corporation, whose equipment and course of instruction is considered by the minister to be efficient, is entitled to receive a subsidy out of the National Treasury for the period of five years to the amount not exceeding the sum which the original founder appropriates towards its maintenance. This term of subsidy may be renewed.

Supplementary Technical Schools.—According to the provisions of Supplementary Technical School Act of 1902, these schools provide such knowledge as is most useful for those who wish to engage in any branch of trades and industries, and at the same time general education is also continued to supplement what they already have learned previously. The entrance qualifications consist in having some rudiments of general education which are equal or above the ordinary elementary school standard, and in being not younger than 10 years of age. The length of the courses is also fixed so as to suit the local convenience.

Apprentices' Schools.—The apprentices' schools admit pupils who are not younger than 12, and who also have general education equaling the ordinary elementary school standard. The course of study extends from six months to four years and a good deal of freedom is allowed in fixing the term and the school hours. The present regulation was issued in 1904.

Industrial Schools.—These schools are the principal organs of industrial education as fixed by the Provisions for Industrial Schools issued in 1899. Children 14 or older, who have received the four years' course of the higher elementary schools or upwards, may be admitted. The course of study extends over three years and it may be lengthened by one year. Preparatory courses may also be added, and boys of 12 years of age or upwards who have passed the second year of the higher ordinary school are taken. Special courses are also organized for the benefit of pupils who cannot follow regular courses and who wish to learn special subjects.

Agricultural Schools.—The agricultural schools are established in accordance with the Provisions for Agricultural Schools issued in 1899. They are of two kinds, those of A and B grades. A grade schools admit only those who have passed a higher elementary school of four years' course or who have equal or higher attainments. The courses of study run for three years, and they may be lengthened by one year. In the B grade, boys of 12 years or older, and who have graduated from the ordinary elementary schools or have similar or higher attainments, can apply for admittance. The course of study extends over three years. In the former grade school, preparatory courses may also be added. Special courses may be established in both.

Commercial Schools.—These schools are founded in accordance with the Provisions for Commercial Schools issued in 1899. They are also of two grades commonly termed A and B, respectively. As to the rules of admittance, the length of courses, etc., these two kinds of commercial schools are exactly the same as those of the two corresponding grades of agricultural schools. The only difference consists in the length of the courses. In the commercial schools of A category, they may be continued for five years.

Nautical Schools.—Schools of Marine Products, etc.—In 1899, the Ordinance for Nautical Schools was issued. They are of two kinds, and the regulations are about the same as the technical schools above explained. The higher navigation school is under the control of the Department of Communications. With regard to the schools of marine products, the ordinance regulating to their establishment and working was issued in 1901. All these schools thus far enumerated belong to the grades of primary and secondary education, and other technical schools which are of a higher standard are called Special Technical Schools, and come under the Ordinance for the Special Schools, of which some explanation has already been given. They are mostly government institutions. The High Industrial Schools which give a higher grade of industrial education are found one each in Tokyo, Kyoto, Osaka, Nagoya, Kumamoto, Sendai, and Yonezawa. As regards High Agricultural and Forestry schools, there are one each in Morioka and Kagoshima. Of the High Commercial Schools there are one each in Tokyo, Kobe, Nagasaki, Osaka, Yamaguchi and Otaru. Boys who have finished the middle schools or have similar qualification can apply for admission. The applicants to these schools are so numerous that only one-third to one-tenth of the total number of applicants, the proportion varying with the different schools, can be admitted. The government and private benefactors are making common cause to establish more of these schools to meet this deficiency of accommodation.

TRAINING OF TEACHERS AND THE LICENSES.

There are special organizations for training teachers of all kinds of schools. For the teachers of the elementary schools there are both boys' and girls' normal schools, and similarly the teachers and professors of the normal schools, the middle schools and the high schools for girls, are prepared at the higher normal schools, of which two each of both sexes exist, *i. e.* in Tokyo, Hiroshima and Nara. The Nara Higher Normal School for girls is not yet opened. Besides these, there are Special Courses for the Training of Teachers, which are attached to several government schools of high grade. Persons who have not graduated from any of the above institutes, must pass examination to obtain licenses. The government is devoting much attention to providing capable teachers, but the demand is far in advance of the actual supply and many non-qualified teachers are still being employed.

NORMAL SCHOOLS.

According to the ordinance relating to the Normal Schools issued in 1897, one or more

normal schools, where elementary school teachers are trained, must be established in the Hokkaido and in each Fu and Ken. The courses of study extend over four years. The qualifications required for admittance consist of a strong constitution, sound morals, and exemplary character. The applicant must have the license for an elementary school assistant teacher, or show proof of similar attainments, and if boys, must be above 16 and under 20, and if girls, above 15 and under 20. In some exceptional cases they may be between 20 and 25. The aim of the normal school education is not simply to give the pupils knowledge essential for teachers, but also to build them up in a strong, virtuous, affectionate, and dignified character. Shorter courses of two years and four months are provided for boys only under special circumstances. Preparatory courses, training courses for elementary school and kindergarten teachers may be opened. Boarding and the school expenses are defrayed by the localities, and the boys after graduation have the obligation to serve as teachers in elementary schools for 10 years; during the half of this term they must work in the school which the governor designates. For the girls, the time of service is shorter, being five years, during two of which they are under the same obligations as boys in respect of working in a particular school to which the authority appoints.

A new regulation has been issued recently which will go into force April 1908. The main course will henceforward consist of two sections, *i. e.* the First and the Second. The First Section corresponds to the main course hitherto in force, while the Second Section is new. The latter provides one or two years' courses for the graduates of middle schools or high schools for girls, teaching them chiefly pedagogy and such subjects necessary for the elementary school teacher. The time of obligatory service is somewhat shortened, etc.

HIGHER NORMAL SCHOOLS.

The higher normal school is an institution designed to train teachers for the normal schools and the middle schools, including high schools for girls. The regular courses of study in the higher normal schools consist of Japanese language and Chinese literature, of English, of geography and history, of mathematics, of physics and chemistry, and of natural history courses. Besides the above courses preparatory and post-graduate courses may be established. The courses run for one year in the preparatory, three years in the regular and from one to two years and a half in the post-graduate. In some particular cases, special courses may be provided, to which elective pupils may be admitted. The applicants for admission for these schools must be graduates from the regular courses of either a normal school or a middle school. The governor of the locality recommends several candidates and the director of the higher normal school chooses out of them. The graduates who receive the whole school expenses and board must serve for seven years, three years of which they must attend the schools to which the Minister of Education appoints them; those who receive part of their expenses, for five years, two of which are in the schools designated by the Minister; and those who have borne their own expenses, for three years. The term extends over four years. Post-graduate course of one or two years as well as special courses may be provided here.

Besides these there are temporary establishments for the training of teachers where such subjects as are specially needed in secondary schools are taught, for instance, English, Japanese language, natural history, physics and chemistry, etc. These institutes are annexed for the sake of economy and convenience to the universities or other government schools. The graduates from the middle schools or from the high school for girls of four years' term may be admitted. The courses of study generally run for two years. No tuition is charged and school expenses and board are sometimes allowed to them. If they receive them for certain length of time they have obligation to serve after graduation during a certain period.

Special institutes for the training of industrial, commercial and agricultural school teachers are also established. These institutions are attached to the College of Agriculture of the Imperial University of Tokyo, the Tokyo Higher Commercial School and the Tokyo Higher Technical School. School expenses and board are allowed to them. Besides these arrangements, aid is sometimes given to the students and pupils in the College of Agriculture or of other government schools on the condition that they serve after graduation in the technical schools.

THE LICENSES FOR TEACHERS.

All teachers who engage in elementary or secondary education require teachers' licenses. Those in the government schools need none. There are two kinds of licenses for elementary school teachers, viz., general and local license. The former is conferred by the Minister of Education and is valid throughout the whole country, and the latter by the local governors whose validity is confined to the particular Fu or Ken. To receive the local license one must pass an examination, unless he is a graduate of a normal school. The examination of elementary school teachers is carried out by a special board which exists in every Fu and Ken. The general license is granted by the Minister to those who have taught in a public elementary school for 10 years with success. The Minister of Education also issues general license for teachers of secondary schools. The graduates of certain government schools are entitled to receive this license without any formality. A Permanent Board of Examination is attached to the Department of Education whose work is to examine, generally once a year, applicants desiring to become teachers in the secondary schools. The standard of this examination is being gradually raised in view of the increased supply of properly qualified teachers during the last few years. A complete system of pension for all grades of teachers and professors has been established and has no doubt contributed largely towards making the teaching profession an honorable and a permanent one.

NOBUAKI MAKINO,
Minister of Education, Tokyo.

10. **Japan—The Religions of.** *Preliminary Remarks.*—The religious history of Japan is characterized by incessant influxes of foreign religions. The minds of the people have not remained wholly passive towards these influences, but a free and spontaneous development of religious thought and sentiment was almost impossible. The interest of the history, therefore, lies in the manifold aspects of the outward influences, in their adaptations to the national genius and in the several amalgamations which have resulted from these interferences.

In considering the entire history, five periods may be distinguished: (1) The prehistoric religion of the Japanese was an unorganized worship of spirits, both of nature and of the dead. It was, towards the dawn of history, developing a form of ancestor-worship, being closely connected with the clan system. (2) The introduction of Buddhism in the 6th century A.D. gave a new turn to the religious development. During the seven centuries following, various forms and teachings of Buddhism which were prevalent in China were successively imported. But these importations prepared for more original experiences of the people. (3) The 13th century is marked by the appearance of new forms of Buddhism which were more or less distinctly Japanese. It was followed by 300 years of conflict, both religious and political. (4) The political peace and national unity which were restored at the beginning of the 17th century brought peace to religion. But the peace was kept by artificial means—by political oppression. This period, on the other hand, gave rise to Confucianism and the revival of the national Shinto religion, while Buddhism slumbered for a long time. (5) The revolution of 1868 shook off all the artificial restraints that made for peace. The religious sentiment is now growing, and is in a state of ferment, the new element of Christianity having been added and Buddhism reawakened.

Through all these vicissitudes, no Japanese religion ever organized a firm, exclusive national church. Nevertheless, protection by and interferences on the part of the government and the ruling clans always affected the relative positions of the various religions. Every prominent religious body enjoyed, more or less, a kind of state patronage. Thus the ambition to secure the privilege of being sanctioned and protected by the rulers as orthodox was responsible for the chief effort of many a religious leader. But the toleration of various religions and the many attempts at compromise have been characteristic of the whole history.

I. Prehistoric Religion (before circa 550 A.D.).—The prehistoric religion of the Japanese consisted in the worship of the *kami*, or spirits and deities. It is usually known by the name *Shinto*, or The Way of the Kami, but it was not an organized observance or teaching. Both the appellation and the attempts to systematize it are post-Buddhistic. The belief in these kami, whose respective functions and relations to one another were not quite definite, and the simple rituals intended to invoke or to propitiate them, made up the whole of the religion. Anything which seemed to the uncultured people unusual or mysterious was believed to possess a spirit, either benignant or malevolent, or both. Some of the kami were thought to be residing in heaven, and others sojourning among aërial phenomena, natural objects or living beings. Men are, or may become, kami by the manifestation of extraordinary powers.

Though there existed no definite theogony and no clear cosmology, a certain system of mythology may be traced. In the primeval chaos, we are told, some pairs of deities were generated spontaneously one after another. All these seem to have represented productive powers, and the first of them, the High-Producing (*Taka-mi-musubi*) and the Divine-Producing (*Kami-mi-musubi*), are invoked constantly. The last of these pairs, the Male-who-Invites (*Izana-gi*) and the Female-who-Invites (*Izana-mi*), who seem to have been the counterparts of the above-mentioned deities, generated the islands and the several objects of nature, which are all called kami. But of the male alone were born the two most important deities. One is the Heaven-Shining Deity (*Ama-terasu*), the goddess of light and culture, and the other the Swift-Impetous (*Susa-no-wo*), the god of darkness and outrage. The heavenly kami clustered around the former and they drove the latter into exile. The malicious spirits, on the other hand, did not make up a unified force. The contrast of these two deities, as we might expect, did not develop into a dualism, as in the religion of the ancient Persians. On the contrary, a compromise was made of these two. They were considered to be the conjoint generators of the ruling family. This may be due to the introduction of certain tribal compromises into the mythology, and here the influence of the clan-system is visible.

Each tribe or clan had its own tutelary or ancestral deity, a hero, a personified quality of nature or a fetish. The special favor of these deities was expected by the various clans, but that did not exclude the worship of other kami in case of need. The Heaven-Shining, the progenitrix of the ruling family, is accompanied often by her noumenon, the High-Producing Deity, who follows behind her. On the other hand, the Great-Land-Master and the Small-August-One, the offsprings of the Impetous, appear as formidable spirits and were worshiped without regard to clan distinctions. But the general tendency of the religion, near the dawn of history, was towards the supremacy of the Heaven-Shining Deity, built upon the basis of an indiscriminate worship of various deities and spirits. The preponderance of the Heaven-Shining Deity and the growing power of the ruling family must have coöperated with each other.

Curiously enough, in spite of the belief in the spirits and in the ancestral deities, the ideas about a human soul and its future conditions were rather vague. There was a kind of Hades, the Land of Gloom (*Yomotsu-kuni*), and also the Heavenly World. Not every one, however, was expected to go to either the one or the other after his death. The soul was believed to be composed of two parts, the one mild, refined and happy, and the other wild, raw and raging. The latter manifested itself separately

from the person to whom it belonged, even to his own astonishment. Whether every deity or human being was believed to possess these two, or powerful persons only, is not clear.

The ritual of a religion like this was naturally quite simple. The deities were worshiped in their abodes, in simple buildings or as inhabiting natural objects. There were no images but only representations in mirrors, and in other objects. The offerings consisted of raw foods, drinks, flax, etc. Prayers were recited or rituals performed before them. The Harvest and the Feast of the Purification, the latter of which was celebrated twice a year, were the greatest festivals. Spells and divinations were known but were not elaborate. The divine efficacies of the objects connected with the rituals were believed in and made use of mostly against evil spirits. Priestly families existed but the priestly traditions and practices were not limited to them.

II. The First Period of Buddhism in Japan (circa 550-1200).—Constant communication with the continent brought various arts to the islands, one after another. The introduction of the Chinese writings gave the people some acquaintance with reading and writing, and possibly the aspiration for a higher civilization, but scarcely any religious influence. In 538 (usually but erroneously ascribed to 552) Buddha's religion, represented by his image and some scriptures, was presented to the imperial court by King of Paikchoi (a state in Korea) as the sign of homage and friendship. The existence of a kami called Buddha, who was said to be infinite in his power and wisdom and who was represented by a fine image, unknown before, was an amazing revelation to the court people. Some of them, who had probably been worshiping the deity before, were in favor of receiving the presents, but many others, who adhered to the worship of the national kami, were against it. The conflict was involved with political and clan strifes. It lasted 50 years, during which time the new worship was supported by frequent importations of its missionaries, by works of art and also by some signs favorable to it. The fall of the conservative party and the ascending of Prince Shotoku, the Constantine of Japanese Buddhism, to the regency decided the final issue of the struggle. The Three Jewels (Buddha, his Law and his Church) were proclaimed as the ultimate foundation of the national faith. Temples and monasteries, side by side with asylums and hospitals, were built in, and near, the capital. Priests and artisans immigrated in throngs. The Prince himself gave lectures on the Buddhist scriptures. We owe the oldest writings and inscriptions to the Prince and the works of art to Buddhism under his reign.

Buddhism brought a new ideal, that of the communion with the saints and of the birth in Buddha's Land. The relics of art and literature testify to this. But the most influential factors of the Buddhist propaganda were the activities of artists and missionaries. Through the channels of industry they begun to refine the sentiment of the people. At any rate, it was an overwhelming power, incomparably more powerful and appealing in every respect than the pristine faith. The civilization of Japan made a leap by embracing the Buddhist religion, but at the same time the spontaneous development of Japan's own religion was arrested.

During the 200 years following this decisive step, the missionary zeal and the activities of Buddhist priests were indeed admirable. Their influence soon made itself felt in the provinces. Roads were built, rivers bridged, mountainous regions made passable. The influence of Buddhism progressed steadily. The greatest patron of the newly introduced religion was always the one who occupied the Imperial throne. The idea was that the tranquillity of the country and the security of the throne depended upon the favor of Buddha and his celestial attendants. Thus temples built were dedicated to these supernatural guardians, and the manuscripts of the sacred texts were distributed in the provinces in order to secure the benefits of the celestial guardianship. But this was not a merely superstitious idea. Constant distribution of medical materials and the sending of physicians accompanied by preachers into the provinces must have been received by the people with great gratitude, both towards the religion and the government. We can imagine also how the provincial cathedrals impressed the people's mind with the powers of the Imperial court and of the Buddhist hierarchy.

The progress of Buddhism culminated in the foundation of a central cathedral near Nara, the capital. It was dedicated to Lochana, one of the spiritual bodies of Buddha, and on the occasion of the thanksgiving for the first discovery of a gold mine in Japan (749), the sovereign (Shemu) himself bowed before the gigantic statue of the Buddha, declaring himself to be the Servant of the Three Jewels. The Empress was no less eager in showing her piety. Works of charity were instituted by her. Buddha, in the disguise of a sick man, is said to have been cured by her in her hospital. These examples were imitated by nobles and much wealth was lavished on the pious cause.

Even under this marvellous progress of Buddhist influence, the old faith in the kami kept its hold firmly on the people. The construction of the central cathedral was completed primarily on account of an oracular sanction given by the Heaven-Shining Deity. The alleged sanction was based on a conciliatory explanation that the Deity herself was a manifestation of Buddha. This compromise gave a stimulus significant in the further development of Buddhism, both to its gain and loss. The step became once for all a typical model of the further amalgamation of Buddha's religion with the old worship. The compromise was a natural outcome of the Buddhist propagandism which was largely carried on by the means of outward splendor and the idea of immediate helpfulness. Of course, these were aided by the teaching of Buddhist philosophy and by moral disciplines, both of the monks and of the laymen. But this wisdom and morality, on the one side, and the ideal of salvation, on the other, were rather loosely connected. The rebirth in a heavenly world, rather than the ultimate enlightenment, and in addition, the worldly benefits which the religion afforded, were the chief attractions.

This circumstance furnished the reason for the religious arts of this period—chiefly mural paintings and sculpture. The Buddhism adopted by the Japanese was, first of all, a religion referring constantly to beauty. The classical period of Japanese sculpture, which has never been excelled by the later ages, was the result. It is perhaps needless to state how Buddhism refined the æsthetic sentiment of the people by its arts, gave a stimulus to the building of more lasting abodes by its architecture, and made firmer the social organization by the help of its hierarchic institutions.

The removal of the Imperial residence from Nara to Kyoto in 794 marked a parallel change, not only of the chief seat of Buddhism but in its doctrine also. One monastery on a hill near the new capital, known thence as the Hiei, and a temple in the town were founded under Imperial patronage. The two most conspicuous personages in the history of Japanese Buddhism, Saicho (whose posthumous name is Dengyo, 767-822) and Kukai (posthumous Kobo, 774-835), afterwards the abbot of the above-mentioned temple, were despatched to China in 804. This opened a new path for Buddhism. The religion of these two was characterized by its elaborate system of mysticism, most probably a form of Buddhism mixed with Hinduism and Persian Magism. Here doctrine and ideal, philosophy and religion were more closely connected than in the Buddhism of the Nara period.

Dengyo's teaching was founded upon the Buddhodology of the Lotus of the Law, the Johannine Gospel of Buddhism, so to speak. In it the personal Buddha was revealed in his real, though quasi-historical, and spiritual aspects. The historical Buddha, the revealer of the Way to the Truth, is at the same time the Truth itself. These two aspects of Buddha's personality, together with his manifestations to believing spirits of all possible varieties, make up the Buddhist Trinity. All the practices of virtue, meditation, mysteries and the wisdom of philosophy are, with Dengyo, to be concentrated in the belief in the trinitarian Buddha. Though the mystic side was the chief source of the influence which Dengyo and his successors exercised upon the court, other sides of his religion were cultivated in his monastery on Mount Hiei. In this way the hill monastery became a centre of Buddhist religion and learning and several branches of the later Buddhism flowed out of this fountain.

On the other side, Kobo's Buddhism loses sight of a personal Buddha in the mist of a mystic pantheism. It was a curious combination of phantastic idealism and extreme materialism. The mystic practices founded upon this doctrine became the chief attractions both to the court and the people. Kobo's ingenuity and zeal gradually overpowered Dengyo's faith and many of the latter's followers found it more useful to accentuate the mystic side of their master's teaching. Thus the Japanese Buddhism of the four centuries from the ninth onward was chiefly a eudemonistic mysticism.

During this period the growing centralization of the government and the splendor of the court life, on the one side, and the hierarchic system of the two centres of mystic Buddhism, on the other, helped one another in their development. Buddhist ceremonies became the order of the day in the court. Sermons and sacraments in numerous temples were attended by throngs, both of the high and low in rank. Bishops and abbots became dignified nobles, exercising their influence upon affairs political and military. Thus there were two state churches at this time.

Still care must have been taken of the kami of old. The amalgamation of the kami-worship with Buddhism went on. While Dengyo's attempt on this line was not quite successful, Kobo's mystic pantheism was just fitted for the Buddhistication of the old deities. The Ryobu, or syncretic, Shinto now came into vogue. Every Shinto sanctuary was attended by Buddhist priests and their rituals were a mixture. But as the Shinto belief was affected by Buddhism, so Buddhism was to a great degree influenced by the Shinto religion. We can speak of a systematized Shinto as existing after this time, and the syncretism continued till the Restoration of 1868.

Though the mystic Buddhism became, in this way, the ruling force of the age, the nation was no longer merely passive. The reaction of the national, or rather human, sentiment upon the religion began to be felt. It was manifested in a eudemonistic sentimentalism. In the midst of solemn ceremonies and the luxurious splendor of life, the evanescence of worldly things was felt and the aspiration for an eternal bliss became conspicuous. The people, who had long since ceased to be naïve children of nature, were led to the conscious consideration of the problems of human life and to self-introspection. Side by side with painting and sculpture, literature imbued with Buddhistic pessimism became a great influence. Romantic sentimentalism, combined with an uneasy spirit, marks many romances of the latter part of the period. Thus a current of disquieted and aspiring emotion was flowing under the outward brilliancies, both religious and social.

III. Religious Struggles (1200-1600)—The above-mentioned current finally manifested itself in a powerful way, when the Fujiwara clan, which furnished the sole directors of the flourishing court life and the ruling political forces, was overpowered by some military clans. Political and family strifes in the middle of the 12th century brought the weakness of the court to the light of day. To the place of the Fujiwara nobles the military clan of Taira succeeded. But this latter enjoyed only 30 years of luxurious life and was crushed by the Minamoto clan (in 1185). Instead of the refinement and luxury of the preceding clans the Minamoto rule was a high-handed militarism, and they ruled the whole country with their headquarters in an eastern province. This momentous change, though long since prepared for, impressed deeply the people in the capital and the western provinces. Cherry blossoms in full bloom were dispersed suddenly by a frosty storm. Not only the poets felt so, but all the people saw the change actually take place before their eyes. It was not a mere political revolution. The Buddhist hierarchy lost its power together with its political supporters. The people's longing for an ultimate faith was no longer satisfied

by elaborate mystifications and gorgeous rituals. The result was the rise of pietism.

The germ of the pietistic faith had been, for a hundred years, fostered in the monasteries belonging to the Hiei. Faith in Amita the redeemer in the Western Pure Land (Jodo, or Sukhavati) had its propagators in several writers, painters and itinerant preachers. The time was ripe for its rise; sentiment and aspiration demanded it. Its coming into power was signalized by the exile of Honen (1133-1212), the promulgator of the faith, together with his disciples in 1207. The government was obliged to take this step by the instigation of the priests of the Hiei, the centre of the orthodox learning. Honen opened the only gate of salvation that all might enter by a simple and devout faith in Amita's redeeming power. Amita's grace, into which we can be taken by invoking his name, was the gospel he brought forward on the authority of the sacred text of the Sukhavati-Vyuha. Conversions in masses took place; conversions of the nobles and courtiers amazed by the sudden decline of the court splendor, of the military men disgusted with their barbarous pursuits, of the common people long since dissatisfied with the mere outward forms of religion. His saintly personality with his simple gospel of salvation was indeed a revelation of the serene light issuing from the Western Land of Bliss.

Honen was succeeded by many able disciples. One of them, Shinran (1173-1262), popularized the faith by still more appealing doctrines. He disregarded the signs of Amita's grace, the abundant repetitions of the Buddha's name; he also abolished the prohibition of the marriage of priests: all in contrast to his master. Not «virtues» but «faith» was his sole watchword. This was quite a new phase in the history of Buddhism; Shinran's religion (now called the Shinshu, or True Sect) continues to this day to be the most influential in Japan.

The pietists were followed by a prophet. Towards the end of the 13th century Kublai, the Mongol Emperor, subdued nearly the whole of the Asiatic continent, and his army and navy began to threaten the Island Empire. Great were the fear and the commotion throughout the country. Nichiren (1222-1282), the prophet, took this opportunity to warn the nation that it would be vanquished by the invaders, unless conversion to the true faith should take place. His faith was the orthodox teaching of the personal Buddha, as taught in the Lotus of the Law, and his tenet consisted in the adoration of the truth by uttering the title of the scripture, which he considered to embody the Trinity. With this cry of «Return to Buddha» and his prophetic utterance in the tone of a Jeremiah, he opposed every prevailing authority, both political and ecclesiastical. Insults followed by trials and prosecutions, only helped to strengthen his enthusiasm. At last, during his exile in a remote island, he attained the conviction that he was the Suffering Sage whom Buddha had destined for the propagation of the Law in the latter days of the world. After this, in a retirement of eight years, his thought was occupied with the spread of his Buddhism from Japan to the whole world. This Japan-centric idea tinted his religion with some Shintoistic ideas. Though his dream of universal religious unity remained unrealized, his prophetic zeal and his patience in suffering were emulated by his disciples.

To the awakening of faith in various ways another new feature was added by the introduction of the Zen Buddhism. Eisai (1141-1215) and Dogen (1200-1253) were its agents. They differed in the transmissions of the method and in the characteristics of its practice, the former's being more poetic and the latter's popular. But both taught a simple and direct method of emancipation from worldly troubles by practising Zen (Dhyana) or meditation. The method is characterized by the absence of dogmas and consists in simply striving to realize one's own inner self. There the practitioners are taught to arrive at Buddha's wisdom which is coeval with reality. But reality does not exclude phenomenality. When once the innermost self is realized, everything, though seemingly ephemeral and offensive, becomes resplendent with bright rays of eternal light. It was quite natural that this simple method converted most warriors. The Buddhism of temples was substituted by that of the fields and camps.

In the pietism of Honen, the revivalism of Nichiren and the intuitionalism of the Zen practice, Japanese Buddhism attained its own standpoints. These new departures, which were concomitant with the growth of national self-consciousness, influenced the life of the nation in every respect. Visions of the blissful superhuman existence, resulting from pious faith, or nature and landscape in their appeal to serene meditation, became the theme of paintings. Rhapsodists recited the rise and fall of contending clans with many episodes in which figured the men and women who were saved from sorrow and agony by faith. Religious teachers wrote their epistles and hymns in simple yet powerfully appealing Japanese, in contrast to the dogmatic treatises of the preceding period, written in Chinese. Monasteries and mansions, hermitages and cottages came to have closer communication. Popular education instead of profound philosophizing; counsels and services relating to daily affairs instead of mysteries and rituals; these were the instruments of the propagandism. Tea, fans, kakemono, caligraphic drawing, Japanese smile, the sternness of expression, everything now known as peculiarly Japanese is the product of these influences, directly or indirectly.

The firm and peaceful government under the military regentship, which lasted over 100 years, was followed by political disintegration. The Age of Wars lasted from about 1330 to 1600. It was also the age of religious conflict. The followers of Shinran increased rapidly throughout the country. They organized an almost extra-territorial church, with the abbot of Hongwanji (their central temple) as their head. The old centres of Buddhism on the Hiei and other mountain temples were occupied by armed bonzes. The missionary zeal and fervent attitude of the followers of Nichiren everywhere encountered bloody resistance. Religious bodies and orders became militant and fought not only each other, but feudal lords also. In the midst of this confusion minor sects arose. Every possible idea and practice found its promulgator

and its followers. It was the Zen monasteries that cared for the preservation of literature and the cultivation of useful arts during this time.

Some attempts were made at organizing the Shinto religion which had almost been absorbed into Buddhism. Chikafusa (died in 1354), the loyal noble of the Southern Dynasty, tried to combine Japanese mythology with Buddhist cosmology and in that way to explain and confirm the divinity of the sovereigns. He became, in this latter respect, a forerunner of the nationalistic Shintoists of the 19th century. A family of diviners, Urabe by name, and its chief representatives in the 16th century founded a school of Shinto, called the Unitarian Sect (Yui-itsu), in antithesis to the syncretic or double Shinto. But in reality it was a combination of Dengyo's monistic Buddhism with several alien ingredients. In their writings, profound philosophical sayings are found side by side with curious explanations of mystic practices. Another branch of Shinto was founded in the 16th century, though its completion dates from the next century. It is named the Geku-Shinto, having been organized by the priests of the temple Geku, a counterpart of the shrine dedicated to the Heaven-Shining Deity. The system was much imbued with Confucianistic elements, not of moral teachings but of cosmology and divination. All of these priests who formulated doctrines were voluminous writers but their influence was not remarkable.

The fermentation was increased by the unexpected arrival of the Jesuit fathers in the middle of the 16th century and by their amazing success, which was partly due to the rifles which their countrymen imported. Some feudal lords got the new fighting instruments together with their new faith. They fought their neighbors with the help of the rifles; temples and shrines were devastated. The rise of the Jesuit party culminated in the establishment of a central cathedral in the capital (in 1568) under the patronage of Nobunaga, a feudal lord who then ruled in the capital. Nobunaga was a mortal foe of the Buddhist soldier bonzes and fought them incessantly. It was his religious policy to welcome the new propaganda. The converts numbered at that time nearly three hundred thousand, among whom there were many feudal lords. But the turn of their fate began with the death of their patron in 1582. His successors endeavored to expel the missionaries and the obstinate converts from the country. The last blood of the martyrs was shed in 1638, when the stronghold of the Christian insurgents was crushed. Unexpected as was their arrival and amazing as was their success, the Jesuit fathers disappeared from the country like a comet. Their name corrupted into Japanese «Kirishitan Bateren» (Christian Padres) alone remained, inspiring something aweful in the minds of the people even in recent times. Nevertheless, a group of humble fishermen near Nagasaki have remained attached to their Christian faith in secret, through over two hundred years of strict inquisition. Their faith has been revealed since the revisiting of the Catholic Fathers in the 19th century.

The period which had a glorious start of religious awakening ended thus in a miserable absorption of religion into politics and battles. Nevertheless the beliefs sown in the heart of the nation still remain and must grow up again.

IV. Peace and Slumber (1600-1868).—The complete extinction of Christianity was synchronous with the firm establishment of the Tokugawa Shogunate. The new régime put an end to the age of warfares, both feudal and ecclesiastical. The policy of the new government in regard to religion was to keep, strictly, the *status quo* of the various branches of Buddhism and to guard against any rise of Christianity by means of the religious census conducted by Buddhist priests. Each Buddhist body was allowed self-management but no change of area of jurisdiction was allowed. The state churches, so to speak, were richly patronized by the authorities. Slumber began in ease.

Another remarkable feature of the state management was the establishment of an orthodox Confucianism as a system of moral instruction apart from ecclesiastical institution. The orthodoxy was founded upon the writings of Chu-hi, a Chinese philosopher of the 12th century. Obedience was the first and last of his teaching, and this was the most suited to the intention not only of the central government but of the feudal states, all of them now eagerly seeking to keep peace and to establish order. The samurai (comprising the warrior and ruling class) were trained in the orthodox moral teaching. The morality of faithfulness, stern justice and rigorous self-discipline combined with the code of honor, which had been fostered among the samurai during the long Age of Wars. These made up the Bushido, the way of the samurai. See JAPAN—THE SAMURAI.

The establishment of the orthodox teaching had two kinds of consequences. One was the general indifference of the samurai class towards religion, and a feeling of antipathy towards Buddhism. Though Confucianism was not destitute of cosmological and philosophical speculations, its centre of gravity was practical morality. Self-discipline, domestic management and state government were the cardinal interests of its teachings that were now adapted to the orthodox teaching current among the samurai. A positivism and a Stoicism like this is everywhere an opponent of religious faith. Thus Confucianism, which had been transmitted chiefly by Buddhists, now became their opponent. Buddhism incurred an antagonistic criticism, for the first time in the history of its existence in Japan, from an orthodox Confucianist in the middle of the 17th century. His example was followed by nearly every Confucianist of subsequent years. This anti-Buddhistic tendency among the samurai class was most felt at the time of the Restoration and is felt even to-day.

The other consequence was neglect of the moral training of the common people and contempt for the merchant class. Not only was the moral code of the ruling class incapable of refining the people, but it was more convenient for the rulers to keep them as blindly obedient servants. Husbandry was regarded as the only source of wealth, but husbandmen were mere producers. Trade was thought a treacherous occupation and merchants were treated

as base, contemptible people. It was quite natural, in this condition of society, that general education was left in the hands of poor schoolmasters who taught reading and counting only, or at the mercy of Buddhist priests, who became more and more corrupted in conditions of ease and security. To meet the need there arose, in the middle of the 18th century, an ethical movement which was humanitarian in its spirit and popular in its practice. The movement is known as the Shin-gaku, or Mental Learning, which means the culture of the mind. The teachers of this popular education were men of admirable character, their teachings were quite inclusive and plain, and their lectures and writings were persuasive in tone, attractive and intelligible to all. The movement flourished, and continued to have great success up to the end of the Shogunate régime, when its quiet and meek character no longer fulfilled the need of the time.

Buddhism enjoyed, as the patronized religion, a peaceful slumber during this period. But its activity never died out. It was during the peaceful times that most of its writings were printed, and that, a thing more important, the dogmatic system of each of its sections was organized, so that in form it reached the utmost refinement. Strifes of orthodox teachers of dogma with heretics were characteristic of Buddhism at this period. Appeals for decisions were often taken to the government and many tragi-comedies were played by the meddling of the officials with subtle dogmatic discussions. Curiously the Shinshu men, the followers of the pietist reformers of the 13th century were foremost in these struggles.

Among the Confucianists appeared many men of more or less original genius, more of them outside the orthodox circle than within. Their struggles with the orthodox teachers and also among themselves were so severe, that the government at last found it necessary to prohibit the heretical branches. Still they made common cause with the orthodox men in their attitude against religion.

To these opponents of Buddhism was added a new factor, *i. e.* the revival of Shinto. The first section of the revivalists was composed of learned Confucianists and samurai. Their creeds amounted to obedience to the heavenly reason and to its practice in loyalty and filial piety. Loyalty, not only to the feudal lords but to the Imperial throne, and filial piety, chiefly expressed in ancestor-worship, made them advocates of the Shinto belief. Thus the orthodox Confucianism adopted by the Shogunate government became one of the factors which threw down the existing régime and restored the Imperial authority. The second section of the new Shintoists were Japanese philologists. Studies of the ancient mythological and historical writings, the first impetus to which was given by a Buddhist monk, were now used for the revival of the ancestral religion in its ancient and pure form, at least such as these philologists thought it had been. Indeed, their Shinto was free from Buddhistic and Confucianistic elements, but the most prominent of them, Hirata (+ 1843) was already influenced by European learning. These men and their followers contributed to the restoration of the Imperial régime and influenced the religious policy of the new era. But their religious influence was not deep.

Another remarkable feature of the Shinto revival was the appearance of some monotheistic Shintoists, during the last century of this period. They considered themselves Shintoists and they are called so. But in reality their beliefs were loosely connected with ancient traditions. They were men of original religious experiences, almost visionaries. Kurozumi (+1849) the most prominent among them, can be called a propounder of almost pure monotheism in a very simple and devout form.

V. The New Era, Reawakening and Fermentation (1808—).—The new era opened with the restoration of the Imperial authority in 1868. Chauvinistic Shintoists and Confucian samurai, both prominent agents in the political transformation, tried at first to establish a national religion. The National Cult Department stood at the head of the new government and every means was taken to exclude Buddhist influence. All the privileges granted to Buddhist priests and temples were abolished at once. Buddhists were driven out of the kami-temples that they were attending; idols, decorations, scriptures, etc., were taken out and burned. Even cremation which had been introduced by the Buddhists, was prohibited. The purification of the national religion was carried out, after 1,200 years of its mingling with Buddhism. The establishment of the Shinto faith as the state religion was fatal to Buddhism in its material aspect, but this loss was to be compensated by its spiritual reawakening. The zeal of the Buddhists, combined with the unstable political conditions after revolution, influenced the government to the extent of instituting an Ecclesiastical Board, under the supervision of which both Shintoists and Buddhists could preach the «patriotic and humanitarian principles» as the authoritative teaching of the state (1872). The two religions now stood on an equal footing. After three years the Board was dissolved. Buddhist temples were allowed their respective independent management, and Shintoists were ordered to organize their own bodies apart from the court ritual. The fervent Shinto revival subsided, after a few years' sway, and the freedom of belief was pronounced *de facto*.

The same year (1875) witnessed an event decisive for the progress of Christianity. This was the return of Neeshima from America and his founding the Doshisha Theological School. Prior to this, the prohibition of the Kirisitan Bateren had been withdrawn (in 1872). Young men converted to the Christian faith gathered themselves together in several towns, with a high aspiration—to enlighten themselves and their countrymen. Firm in their belief, they had withstood the effects of the suspicion and hatred of their neighbors and the threatening of their samurai fathers. Now these enthusiasts found their leader in Neeshima. The opening of the campaign for the Gospel at the beginning of the new era was a bright one and its rapid progress up to the end of the eighties was astonishing. The amount of the educational works produced by Christian mission schools during these years can never be overestimated. The moral ideas which Christianity has sown

are now bearing fruit, especially in the matrimonial relations. Side by side with the Protestants, the works of the Catholic and the Orthodox missionaries progressed steadily among the lower classes. The Christianization of the whole nation seemed not to be a mere dream. But this was a surface current. A parallel current of agnosticism and a hidden one of reaction once more manifested themselves.

The conservatives, who had once been against the opening of the country to the «foreign barbarians,» ran to the other extremity after the Restoration. Everything European or American seemed to them to be the best. Together with railroads and telegraphs, Rousseau, Mill and Bentham were welcomed indiscriminately. The rapid progress of Christianity, especially Protestant, was partly assisted by the Europeanizing tendency of the time. But the nationalistic ideas never died out. When, towards the end of the eighties, problems of the treaty revision gave rise to anti-foreign feelings, reaction made itself felt in the religious sphere. Buddhists were foremost in the anti-Christian movements. All conservatives, many of whom were Shintoists or Confucianists, gathered under the banner of a «Buddhistic Patriotic Union» or of an «Association for the Establishment of the National Religion»—which they called «The Great Way uniting the Three Religions.» They forgot their former antagonisms and joined hands, simply to oppose the foreign religion. They were also aided by young Buddhists who had studied Western philosophy and who fought Christianity with Draper, Renan, Spencer in their hands. Thus we see here a curious alliance of conservative reaction with agnosticism, the sciences and Indian philosophy. But the Christianity which prevailed at that time deserved these attacks. By many of the converts it was accepted because it was the religion of the Westerners, who were inventors of the locomotive, or who spoke the enlightened English language.

The combined reaction was followed by more clearly nationalistic ideas. In 1890 an Imperial edict on the national code of morality was issued. It was founded upon «the teaching of the Imperial Forefathers» and aimed at the unification of national morality. These features of the edict were made use of by some thinkers as the weapons to be used against Christianity and later against religious faith in general. The war with China in 1894-95 gave a momentous impulse to the rise of the nationalistic consciousness and to the reawakening of the samurai spirit. The educational circle that never allowed religious elements to come into it, and which was composed mostly of samurai's sons, advanced from the attack on Christianity and Buddhism to the attempt to dictate to the nation's conscience an authoritative principle. Shintoists now separated from Buddhism. Though the attempt to organize an influential body failed, the ideas represented the creed of the majority of the educationists. The propagandism may be renewed hereafter.

The religious problem of New Japan was now translated from the differences between the old and the new, or between Christ and Buddha, to the antithesis between religion and irreligion. Whether there is to be a religious faith or a mere moral teaching; this has been the point of the dispute since that time. Soon after the outbreak of the dispute, a meeting of leading Buddhists and Christians in friendly terms was held (in 1896). Some of the addresses given at the meeting pronounced the hope that the followers of Buddha and of Christ might join hands against their common foes, the advocates of irreligion. The meeting marked a turning point in the solution of religious problems and became the predecessor of the present Religious Union of Japan.

While a group of educationists was trying to invent a substitute for religion and religious leaders were looking for a new opening, the people were left to themselves. Most of the Buddhist sects were engaged in internal struggles. Buddhist teachers themselves were destitute of faith; neither their old traditions nor the newly allied philosophy was able to give them vitality. Some Shinto sects were founded or revived. Most of them had little to do with the nationalistic Shinto, but they represented various shadings of popular theistic religion. The most influential of them, the Tenri, or the Heavenly Reason, teaches that there is a sole Supreme Divinity and preaches absolute faith in Him. But these beliefs are mingled with superstitious practices and obscure cults. These dark sides became manifest when economic panics after the war were manifested by a general emotional depression. At the same time religious needs among the younger generation began to express themselves in the two extremities, scepticism and sentimental pietism. There arose many unions of young Buddhists with various affiliations ranging from rationalism to revivalism. Christian churches began anew to be thronged by young seekers after faith. The increased publication of religious essays and books of devotion, both Buddhist and Christian; new editions of the writings of ancient Buddhist teachers; the organization of religious and philosophical lectureships; these signs showed an urgent demand for faith and truth. The seeking was naturally accompanied by uneasiness and disquietude of head and heart. The general dissatisfaction with the prevailing forms of religion, philosophy and ethics gave opportunities for the rise of several extreme propositions and theories. Tolstoi, Nietzsche, Leopardi were often referred to. These disharmonies marked the turning of the century and in the midst of the struggles and conflicting influences, the war with Russia (1904-1905) broke out.

The religious and moral struggles which seemed to have subsided during the war became again prominent soon after its close. Adoration of the way of the samurai and pleading for the ancient patriarchal system, ancestor worship, etc., followed the celebrations of the victories. Though strict monogamy and the idea of chastity have been growing, marriage is thought by the advocates of the patriarchal system a union not only of individuals but of the families to which the individuals belong. Militarism is getting more hold in education. Side by side with the advocates of these reactionary ideas there appeared some who alleged that they had seen in vision God or Buddha, and some prophets who pretended to be revealers of new

truths. Standing between these two extremes, the Buddhists of the younger generation are eagerly striving to reëstablish their faith in Buddha, and the Christians are seeking for the methods and means of adapting their religion to the characteristic feelings and ideals of the nation. The problems are perplexing, the struggles severe; but there is light in the midst of conflict. The approach of a new era in the religious history of Japan can be welcomed with bright hope.

11. Japan—Japanese Literature. *General History.*—Although the antiquity of Japanese civilization cannot be compared with that of China or Greece, it dates from a remote age. The history of Japanese literature extends over a period of 13 or 14 centuries, and it is therefore possible to give here only a brief account of its progress.

The 7th and 8th centuries A.D., which embrace the Nara period and some time preceding, may be called the Grecian age of Japan, for those who have studied the relics of sculpture, pictorial art, and the architecture of each period are impressed by the strong resemblance. In the sphere of letters, however, the remains are comparatively few. This can be explained as follows. Although Japanese civilization was of a high order in consequence of the influences of Chinese civilization and of Buddhism acting upon a nation eager for advancement, no vernacular letters had as yet been invented, and therefore books were written in Chinese or a very complicated method which made use of Chinese characters to represent the Japanese language. Hence the number of books written was comparatively small, and many of those which were written seem to have been altogether or partly lost. Of those still remaining we have the 'Kojiki' and 'Nihongi' in history, and the 'Manyoshu' in poetry. We also have examples of the ancient Shinto prayers and some Hoodoki—a series of books written in each province by the Imperial command describing the geography, history and traditions of the provinces. In the field of pure literature the 'Manyoshu' may be considered to be a national treasure, while both the 'Kojiki' and 'Nihongi' are most valuable histories of primitive Japan.

The 400 years beginning with the 9th century are generally called the Heian era, and in some respects this may be called the Roman period. It was during this age that Japanese civilization, benefiting by the influences of the Nara period, made signal progress in every direction especially in literature. The intellectual activity of the period may be said to have divided itself into two currents: one for the study of Chinese letters and the other for the growth of the native literature. But the study of Chinese literature became so prevalent that men ambitious to distinguish themselves devoted all their energy to it and the writing of Chinese essays and poems was common, especially among the Court nobles. At the same time the progress made by the native literature was highly commendable. It is significant, however, that the study of the native literature was pursued chiefly by females, and most of the standard works were the production of women. Though there were no native letters during the Nara period, towards its close we have the Kana, or Japanese phonetic alphabet. But it was not until the Heian era that the system of letters was definitely settled, thus making it possible for the first time to write books by phonetically transcribing the native language. The books written according to the new system during these four centuries were numerous, and what may be called the Japanese classics were mostly the production of this period.

The literature of the period may be roughly divided into three classes. The first and most numerous are the books known as Monogatari; the second kind are the dairies; and the last, but not the least important, the miscellaneous works. Monogatari literally means a narrative, but some of this literature are pure works of fiction, and some, such as the Yeika Monogatari, are historical works, though written in a somewhat novel style. There are also several books which are called Monogatari, but more properly belong to the third class. Works of fiction occupy the greater part of the Monogatari class. Here again, many books written during this period have been lost altogether; some are remembered by name only and others remain in a mutilated and confused form. The principal of those still remaining is the 'Taketori Monogatari' (Bamboo Cutter)—a short novel, considered to be the most ancient of its kind. A divine maiden is the centre character of the narrative, which tells of many incidents of courtship by several admirers, ending in the ascent of the maiden to Heaven (vide Victor Dicken's English translation). Next comes the 'Ise Monogatari.' Although this book is called Monogatari its style belongs more to the third kind—miscellaneous. Its chief interest lies in the poems it contains, and therefore it cannot have so much charm for foreigners as for Japanese. After these two works come the 'Yamato Monogatari,' 'Utsubo Monogatari,' 'Ochikubo Monogatari,' etc., containing such stories as of a Japanese student who, on his return from China, was shipwrecked and in the course of time reached Persia, where he learned the secret of

flute playing from a divine personage, or as of a young lady who was badly treated by her stepmother. The stories are always concerned with love affairs. Of all the Monogatari, however, the most famous is the 'Genji.' This is a voluminous work written by Murasakishi kibu, a woman. It narrates stories of love affairs between a young prince, Hikaru Genji, and numerous ladies. From a moral point of view, there are several points which deserve criticism in this work. In fact, as far as its form is concerned, it has some resemblance to the 'Don Juan' of Byron. With regard to the phraseology, however, it has no such naked and disagreeable references as appear in Byron's work (consult the English translation by Baron Suyematsu). Another work which is regarded as equally valuable with the 'Genji Monogatari;' is the 'Makuranososhi' (Pillow Sketches). This is a book belonging to the third class and is written by Seishonagon, another lady writer. It is a collection of short sketches on various subjects, each showing the brilliancy of her pen. (For specimens of these sketches consult Aston's 'Japanese Literature.') Of later productions we may mention the 'Sagoromo Monogatari,' 'Hamamatsu Chiunagon' and 'Konjaku Monogatari.' One noteworthy feature is that Japanese works of fiction of this era far excelled in several respects those of China of the same epoch. Of the 'Nikki' (diary), may be mentioned besides the 'Nikki' written by the author of the 'Genji,' the 'Tosa Nikki,' and 'Kagero Nikki,' which were written before the 'Genji,' and the 'Izumishikibu Nikki,' 'Sarashina Nikki,' etc.

For several hundred years following the 13th century, literature in Japan showed a significant decline. This was due in the first place to the fact that the authority of the Imperial Court suffered a decline concurrent with the rise of militarism, accompanied periodically by civil wars. Intellectual studies were totally neglected among the common people and scholarship in a large measure became a monopoly of the monks. This decay, in the second place, is attributable to the fact that the pure native literature which flourished in the Heian era disappeared, and a new style of writing arose, —a mixture of the Chinese character and the Kana. While resulting in no improvement in the system of writing this produced much confusion, and the mode of writing was thrown back almost to its condition in the Nara era. But the number of literary works produced during this period was not small, and they may be said to possess a significant peculiarity of their own. Enlightenment during the Heian period was confined chiefly to the nobles in the capital (Kyoto), but unfortunately it became debased into mere empty luxury, resulting in the corruption and effeminacy of manners and customs. As a result, the literature of the period lacked vigor and force. The chief endeavor of writers was for refinement and grace. They became weak and diffuse. Moreover, the writers of the period were mostly women, and even men generally imitated the female style. Since the 13th century, however, the chief literary productions, as the result of the prevalence of the military spirit, dealt with warlike themes, though they were mostly written by priests, and were commonly known as 'Gunkimono' (War Narratives). They were written somewhat in the style of romance, and therefore, from a strictly historical point of view, may be open to criticism; but nevertheless they form interesting reading. Of such books we may cite the 'Hogen Monogatari,' 'Heike Monogatari' and 'Genpei Seisuiki.' Such were the general conditions from the 13th century to the middle of the 14th, which embrace the Kamakura and Hojo periods, and in fact, the same conditions continued down to the end of the 15th century, namely the Ashikaga era. The famous 'Taiheiki' was an early production of this age. Mention should also be made of the 'Jingo Shotoki,' which was a historical work of a serious nature, with critical observations, a rare production in Oriental history. Another well known book is the 'Tsuredzuregusa,' which was written in pure Japanese style after the one which appeared during the Heian period, being a collection of short sketches in much the same style as the 'Makuranososhi' (Pillow Sketches). (For specimens consult Aston's Japanese Literature.) In conciseness and pointedness of expression it excels the standard works of the latter period and is classed among Japanese classics. The 'Hojoki' is also of similar nature.

The period which can be compared with that in modern Europe dates from the beginning of the Tokugawa era down to our own day, namely, the last three centuries. For nearly 300 years, *i. e.* since the establishment of the Tokugawa Shogunate in the beginning of the 17th century, Japan enjoyed practically continuous peace, the country during this time being almost entirely secluded from the outside world. In this period intellectual study made great strides under the encouragement and patronage of the Shogunate itself and the feudal lords. Owing to the rapid growth of the new cities of Yedo (Tokyo) and Osaka, the centre of literary activity, hitherto concentrated in Kyoto alone, was now divided between Yedo in the East and Osaka and Kyoto in the West. This literary activity was divided into three great phases; first, the revival of Chinese study; second, research into Japanese classics; and third, activity in the production of all descriptions of fiction and dramatic pieces. As for the revival of the study of Chinese, it not only surpassed that of the Nara and Heian eras, but in the subjects of philosophy, history, Chinese poems and essays, the work was even an object of admiration of the Chinese themselves. The study of Japanese classics resulted in a better knowledge of the ancient books of the Nara and Heian eras, as well as in a clearer conception of the Shinto doctrines. In the sphere of pure literature, however, the revival failed to regain the standard represented by the 'Manyoshu' of the Nara era and other classical works produced in the Heian era. Thus we can see that the revival of both the Chinese study and the research into classical works, although both greatly helped the advancement of general culture, were unable to produce any brilliant native literature, owing to the fact that the first was altogether foreign to the native

tongue and the second mainly limited to research into the works of antiquity. It is in the third phase—the growth of fiction and drama—that we must seek the real merit of the native literature. In scholastic attainments, the writers belonging to this class were not equal to those belonging to the other classes, but their imaginative power and adaptability far excelled the others. While the full scope and variety of the literary productions of the period cannot be given here, it can be said that these works of fiction may be roughly divided into three classes, namely, heroic stories, such as those of Bakin; love stories, such as those of Tamenaga; and the humorous miscellaneous works of such writers as Ikku.

Since the introduction of modern European civilization Japanese literature has shown new vigor, and books of all kinds have been written and published in such an innumerable number as is unparalleled in any past period. The great drawback of the modern system of writing is that it differs from the spoken language. Besides, the use of pure, phonetic letters, without mixing the Chinese characters, has long fallen into decay. Many a writer is now engaged in endeavoring to identify the written and spoken language and devising all sorts of forms of composition. In other words Japanese literature is still in a transitory stage, and therefore there are no standard works to show as specimens of the new literature. It may, however, be said that many valuable works have already been written by representatives of the new generation, with great promise of further progress.

JAPANESE POETRY.

The oldest Japanese verses in existence are those contained in the 'Kojiki,' (*vide* Chamberlain's translation) and the 'Nihongi.' This work was written in the beginning of the 8th century and contains the history of Japan from the so-called «God Period» nearly down to the time of writing. Therefore the dates of some of the verses therein contained are very remote, and it is almost impossible to fix the exact date. Since the 7th and 8th centuries the study of Chinese has become so common and prevalent that from those periods poems in Chinese have been composed by Japanese throughout all succeeding ages. Thus poetry has been of two altogether different kinds; namely, in Chinese and Japanese. The development of the Chinese poetry, too, has been so great as to be almost incomprehensible. To go into more details, at the end of the 8th century there was already a collection of Chinese poems entitled the 'Kaifuso.' During the Heian era the composition of Chinese poems became much more prevalent and collections which were then made were numerous. The writers were generally men, but women were not wanting. From the Kamakura era down to the Ashikaga era, Chinese poetry declined in the general decay of all literary pursuits but was not altogether lost. During the last three centuries, together with the general advancement of literary study, Chinese poetry has made such a striking development as to eclipse that of the Heian era. As, however, the Chinese school of poetry is after all foreign to our real purpose, we must dispense with a detailed account of it here.

The oldest Japanese verses next to those in the 'Kojiki' and 'Nihongi' are those of the 'Manyoshu.' The greater part of these belong to the Nara era, namely, the 8th century, and a portion belongs to the latter part of the 7th century. The most celebrated poet of the period was Hitomaru, who flourished towards the latter part of the 7th century, and the next in degree is Akahito. These two are considered by common consent as the greatest Japanese poets. Next to these we may mention the names of Okura, Yakamochi, and a woman, Odomo Iratsume. (For specimens consult translations by Chamberlain, Aston and Dickens.) During the Heian era poetry flourished between the Chinese study on the one hand and the Japanese literary pursuits on the other. There are seven or eight collections of poems made to the order of the successive Emperors, headed by the famous work 'Kokinshu,' besides many private collections. (For examples of some of those in the 'Kokinshu' consult the English translations above mentioned.) Even after the Heian era the influence of the Japanese poems was still felt and collections by Imperial orders were made from time to time, the total number of such collections made by the Imperial order being altogether 21.

Among the most celebrated poets, men and women, of the Heian era, we may mention Narihira, Komachi (a woman), Sojo Henjo, Tsurayuki, Mitsune and Shunzei; and among those who flourished in the latter part of the period and the Kamakura era, namely, the latter half of the 12th century and the early part of the 13th century, the names of Teika, Karyu, Saigyo and Sanetomo (the third Shogun of Kamakura). From that time down to our own day poetical composition has been maintained unbroken, so that it is impossible to give minute description of it. But from the fact that the presentation of poems to the Emperor and the holding of the so-called «poetry-meeting,» forms one of the Court ceremonies at New Year, it may be seen how deeply this poetic desire is connected with Japanese national life. When we look over the whole history of Japanese poetry, its golden age must be assigned to the Manyoshu period. This contains all sorts of poetic work, from those by the Emperors down to those by the common people of remote regions, those by the Court nobles naturally being the chief. All these seem to show how highly the poetic spirit developed among the Japanese people at large. Besides, the 'Manyoshu' contains the so-called «long» poems as well as «short,» but since the Heian era «long» poems practically ceased to exist. Moreover, while the poetry of the Manyoshu age had force and energy, with concise and sharp expression, that of the Heian era developed on the side of gracefulness and elegance, losing the strong points of the Manyoshu poetry. Thus comparing both the strong and the weak features of the Heian era with those of the Manyoshu age, we can decidedly say that Japanese poetry already showed a marked decay, and this decay has continued through all ages down to our own time.

Beginning about 300 years ago, a new poetic style, called the Haikai or Hokku was developed. This form of verse is even shorter than the «short» poems and has come to prevail side by side with the ordinary poetry. While this latter chiefly prevails among the higher classes of people the Haikai finds favor generally among the lower classes, and therefore is sometimes called the «people's literature.» The Haikai possess peculiar merit and forms a distinct branch of Japanese literature. This style also has a remote origin but we must refrain at present from giving a more detailed account.

Following the Ashikaga era, that is, the 14th and 15th centuries, the so-called Renka («joined poems») prevailed chiefly among the military class. How this style is composed is perhaps worth relating. Several persons form a party, when one composes the first short line of 17 syllables, the next the second line of 14 syllables, the third another of 17 syllables and the fourth 14 syllables, and so on. Hence the name of this peculiar class—perhaps a better term in English would be «coalition» poetry. Each line must be connected in meaning with the preceding one in such a manner that the connection should not appear to be direct. This explanation, perhaps, will be incomprehensible to those not versed in the subject, but it is the most important and interesting character of this poetry. The Haikai is derived from the Renka. In it the lines are composed in a similar manner and the act of so doing termed Tsukeai, that is, «joining together;» the result is known as Kasen. The most important line of the Kasen is the first (Tateku) and it forms a complete poem in itself. This first line, being the opening one of the whole series, is the Hokku, that is the commencing verse. In common practice, however, as a rule the first line alone was only to be composed. Hence the Japanese poem in its shortest form became known as the Hokku. The best known poet of this style is Basho, who flourished about 200 years ago. Prior to Basho, the Hokku had shown a comic tendency, but he changed it, and created the Shofutai, or legitimate style. He is probably the foremost among those who really inherited the spirit of the Manyoshu age and the Heian era.

As to the form of Japanese poetry, there is no rhyme nor strict metrical cadency. About the only element in which poetry differs from prose is that in the former five or seven syllables form one line—strictly speaking, a sentence, for it is not always written in the form of a separate line as in the Western poems. This peculiarity is entirely due to the nature of the language, for poetic euphony and sentiment can be acquired without the use of rhyme or metre. The common method of placing together these five or seven syllable lines is to place each alternatively commencing with a five syllable line. But it is not necessarily a fixed method because some of the long poems commence with seven. In some cases, especially in popular songs, two or three lines of the same syllables are placed together. It differs according to the different periods and the nature of poems and there are lines which are either shorter than five syllables or longer than seven, intermingled with other lines for the sake of variety.

In Japanese composition even poems which are termed «long» are not so lengthy as many Western poems. The ordinary short poems consist of only 31 syllables, 5, 7, 5, 7 and 7, and the Hokku of only 17 syllables, 5, 7 and 5. «Japanese poetry is, in short, confined to lyrics, and what, for want of a better word, may be called epigrams.» This is what Mr. Aston says of Japanese poetry and it is not very far from the fact. Under the circumstances, Japanese poetry when translated into another language will invariably fail to convey any poetical thought to the European mind in general. However, poetry of any tongue has its peculiar charming power to those who have grown up with the language—a power unknown to outsiders. This is most certainly the truth with regard to Japanese poetry. Let us give a few examples:

Tsuki ya aranu
Haru ya mukashi no
Haru naranu
Wagami hitotsu wa
Moto no mi nishite.

The plain literary translation of these lines would be:
Is there no moon?
Is the spring not the old spring?
My person alone remaining the original person?

This poem for Japanese possesses an indescribable charm,—food for sentiment and imagination. The meaning is that while the moon and spring are the same, I alone am not the same old person—told with a pathos which strongly appeals to the Japanese mind not only by its literary meaning, but also by the mode of expression. The piece is the most celebrated work of Narihira, the first writer of the Heian era. Again:

Furu ike ya
Kawazu tobikomu
Mizu no oto.

This is the best known Hokku by Basho and is considered to be a masterly example of his so-called legitimate style of Hokku. Its literary translation cannot be other than as Mr. Aston has it:

An ancient pond!
With a sound from the water
Of the frog as it plunges in.

What can a foreigner make out of it? Yet it strongly appeals to the sentiment and imagination of the Japanese. It carries with it a philosophical idea which is only comprehensible to them. Another example:

Asagao ni
Tsurube torarete
Morai-mizu.

This poem is often quoted by many Western writers. Mr. Aston translates thus: «Having had my well-bucket taken away by the convolvuli,—gift-water!» What foreigner could find any poetical meaning in this without a lengthy explanation? Thus we can see that it is almost impossible to translate Japanese poems into any foreign language and convey their real sentiment and force of imagination.

Hitherto this short review has been chiefly confined to those poems which are chiefly designed for reading. There has, however, always been another kind, though less important in the strict literary sense, namely, verses used for singing or chanting. There are still extant some scores of examples of this class of work from the Nara era and the early part of the Heian era. Since those early days, however, this form of poetry has undergone many changes and grown into many varieties. Generally speaking, these productions are much longer than the ordinary poems. Even the 'Yokyoku' and 'Joruri' are nothing more than a modified form of poetry, but these are dramatic pieces in a sense and we must defer our discussion on this class to the section of the drama.

THE DRAMA.

Theatrical performances in Japan began to assume their present style about 300 years ago. But the origin of the drama is very remote. In the Nara era there were the so-called Kagura and Saibara—dances accompanied by singing and music performed chiefly in Shinto shrines. The difference between the two is slight, the Saibara having a more humorous tendency. Next arose the so-called Sarugaku and Dengaku, much in the same manner as the Kagura and Saibara. The difference between these two is also slight, with the exception that the Sarugaku is derived more from old dances, while the Dengaku has its origin in the pastime of the peasants. Many of the poems used in these various performances still remain. In the Kamakura era the Heike Monogatari, which was written in a high poetic style, was adapted for chanting in accompaniment of the Biwa, a string instrument. In the same era the Dengaku, probably influenced by the singing of the Heike Monogatari, underwent some alterations, and, historical narratives having been introduced into the play, it began to assume the style of theatrical performances. This change was quickly followed by the Sarugaku. Hence arose the No of Dengaku and the No of Sarugaku, the term No being taken to mean performance. The Dengaku, however, soon declined and the Sarugaku alone made continuous progress. In the Ashikaga era, it became the chief source of pleasure for the upper classes, being patronized by the Shogun himself. Then arose a class of professional actors, and the gentry themselves began to learn to sing and even to play and had no compunction in doing so in the presence of their friends. While the acting is called No, the words, the written narratives which are to be sung, are called Yokyoku. In the time when the Sarugaku became popular to the disadvantage of the Dengaku, the term No came generally to mean the No of Sarugaku.

The so-called Yokyoku has much merit as literature. There are nearly 300 specimens of these Yokyoku and nearly all of them are the production of the Ashikaga era. They are not so long as those of the Greek or Roman comedies, but their construction has some similarity, for the words uttered by the actors are not limited to dialogues but contain descriptive parts as well. Thus when an actor representing a certain character appears on the stage, he generally announces who he is, why he has come there, where he is going to and such like. The method of playing has a certain similarity to the modern European opera, for the words uttered by the characters are sung and not spoken all through. The general features of the play show that these works were greatly influenced by Buddhism. This is due in the first place to the fact that the religion exercised much influence over the mind of the people at large, and in the second place to the fact that the playwrights were mostly priests. From the scholastic point of view, the sentences in these plays are not free from defects, but they are strong in the poetical element and some parts of these works cannot be too highly praised. The Yokyoku and No may be called the classical drama of Japan. They enjoy the favor of the upper classes even to this day in the same manner as the opera flourishes in Europe side by side with the ordinary theatre.

After the No there is another class of performance called Kyogen, or short comedies. In ancient times the Dengaku and Sarugaku contained much of the comical element, but during the Ashikaga era, when the Yokyoku and No reached the height of prosperity and was at the same time greatly influenced by Buddhism, they became transformed into tragedy, or at least became very serious in their nature. They lacked comic effects. The Kyogen arose to supply this want, and it became a general practice after a No performance for a Kyogen to follow, for the sake of change. No and Kyogen actors played on the same stage, but as a profession the Kyogen actors were and are considered to-day to be inferior. In the Kyogen, unlike the No, the words are spoken, though pronounced and uttered in the style of the Ashikaga era. As the chief object of the Kyogen is comedy, they have little of the poetical element. But as comedy they are excellent. The Yokyoku and Kyogen plays have always been printed, so that they may be read by the people who are not professional or amateur actors. There was still another kind of dance, or rather play, called the Kowaka, which prevailed side by side with the No. In this the words (text) were called Mainohon, many of which still remain. The Mainohon, like the Yokyoku, exercised much influence on the development of the theatre of later days, but these texts are very similar to those of the Yokyoku, and therefore we may spare any detailed account of them here.

The modern theatrical performance originated towards the end of the Ashikaga era, and soon acquired the name of Kabuki. Since then the name Kabuki has come to signify theatrical performance acted by human actors in contrast to the Ayatsuri Shibai, that is, the marionette theatre. The Kabuki is said to have originated in the dancing and singing performed among other shows on a rude stage at the river side of Shijo in Kyoto by a woman named Kuni, a native of Izumo. Into this singing and dancing, ideas of older performances, namely, the No or Kyogen, were introduced, and before long they assumed the style of the modern stage performance. On account of the origin of the Kabuki, the social position of

this class has always been held in very low esteem, by no means comparable with that of the No actors. Kabuki actors have been generally known by the name of Kawaramono (Riverside people), but contrary to the No, which has made no change or improvement since the Ashikaga era, the Kabuki has undergone many changes and improvements from time to time until it has attained its present prosperity.

As to the Kabuki performances, in the early stage of development women were the chief actors, resulting in the term Onna Kabuki. But boys were also employed and a little later on, even grown-up men. A peculiarity in those days was that women played male characters and men the female. Women Kabuki became extremely popular. Many stages, rude as they were, were established everywhere, but the acting produced much evil effect on the morals of the people and it was finally forbidden by law. Next flourished for a time the so-called Wakashu (boy) Kabuki. This again produced social evil and was forbidden by law. Thenceforth the performers were mainly grown-up men, as we see them on the modern stage, who acted the female characters. As time went on, however, women performers came into existence again, but they formed companies of their own sex only, and the male characters were played among themselves. The number of actresses is now very small comparatively.

In the early days of the Kabuki, the performances were short and simple, plays consisting of several acts having come into existence only by gradual development.

In the beginning there were no professional playwrights. Plays were chiefly written by actors or some one who took an interest in the matter, and further, plays were even devised by the actors impromptu and not written at all. Later on the stage began to have professional playwrights attached to each theatre. Unlike the drama in Europe, these plays were never printed for public circulation, but used only for acting at the time, and were often written more to suit the performers than for literary excellence. And again when an old play was acted it was often subjected to alteration for similar purposes; in other words, the dramatic personæ are often reduced or added to to suit the number or ability of the actors. And therefore the texts of the Kabuki have not much literary merit. Though it may look somewhat strange, it is in the plays of the marionette theatres that we must seek the equivalent of the European drama. The marionette performance originated about the same time as the Kabuki. Previously, there had been a particular kind of chanted narrative, the Joruri, which name is said to have come into use in a long chanting song consisting of 12 sections, and telling of a love story between Yoshitsune and a maiden named Jorurihime. This was written by a lady and was entitled 'Jorurihime.' Subsequently many works of a similar nature were written and the introduction of the Samisen (a three-stringed musical instrument) gave much impulse to their development. To the chanting of these songs the marionette performances were added. Various styles of chanting were also gradually introduced. Towards the end of the 17th century there arose two great geniuses, Gidayu Takemoto and Monzaemon Chikamatsu. Takemoto had a great natural gift for chanting Joruri, and devised a new style of chanting which became known by his name as Gidayu. Chikamatsu was a playwright of the Kabuki. He hit the idea of writing Joruri texts based on the principle of the Kabuki plays. Gidayu Takemoto chanted them to the acting of the marionettes, for which the new theatre known by the name of Takemotoza was established in Osaka. There were then skilful marionette players, and many mechanical improvements were added to the marionettes themselves. By the combined efforts of these two authors and these skilful players the marionettes soon acquired a very wide popularity. The success of this theatre was followed by the establishment of the Toyotakeza, and many writers of great ability, rivals and followers, appeared in succession, such as Kaion Ki, Izumo Takeda, Ippo Nishizawa and Sosuke Namiki. Chikamatsu himself wrote nearly 100 pieces, and his rivals and followers wrote a large number. It is almost a matter of wonder that so many writers of ability made their appearance one after another nearly at the same time. It is also a fact that nearly all the ablest writers were drawn to the side of the marionette theatre, leaving the Kabuki writers far in the background. This state of things now came to exercise great influence upon the Kabuki theatres, and perforce they soon began to adapt the marionette plays for their own stage. The text of the Gidayu is written in a manner somewhat similar to the ordinary works of fiction, containing much descriptive matter as well as dialogues. The point in which the Gidayu differs from the ordinary novels or romances lies in the fact that the general construction of the Gidayu is made to fit the stage and consequently a lengthy description or dialogue is avoided, the whole story being divided into a certain number of acts of nearly the same length. Besides, as the whole is to be chanted, the phrases are suitably written, for which purpose certain metrical devises are applied. These plays are divided into two great classes; one, Jidaimono (historical) and the other, Sewamono (social). The chanting of the Gidayu text is also widely practiced independently of marionette performances and is very popular among the people at large. From this fact these texts are printed and widely circulated. Their great popularity encouraged writers to exert their utmost ability. Scrupulous attention was paid to minor things. At the marionette performance the chanters sit in one corner of the stage while the marionettes are worked by the players in harmony with the chanting.

Like the ordinary plays, action and dialogue in the Gidayu exaggerate, being too direct and strong. We must, however, make allowance for this from the very nature of the play, because the marionettes are mere puppets and the realistic effect on the stage must come from the chanting. If action and dialogue were as common as those of the ordinary actors they would be insufficient to produce the desired effect on the spectators. For specimens of the Gidayu text we may refer to the English trans-

lation of the Chushingura («Magazine of Loyal Retainers») and the Asagao-Nikki («Morning Glory Diary»), both by Victor Dickens. We may also take notice of one other thing. In these plays the proverbial saying encouraging what is good and chastising what is bad, is always aimed at, and they are not so full of love stories as Western plays. In them mere representation of realism is not the main object. The best plays were written in the 18th century during the Tokugawa era.

Although in all fields of literature much progress has been made since the Restoration of the Imperial authority 40 years ago, the production during this time of the Gidayu may be said to be almost *nil*. On the other hand several Kabuki plays were written by eminent scholars and some of them are of much value, as for example, the Kasuganotsubone, written by Mr. G. Fukuchi. Generally speaking, however, playwriting is still in a transitory stage and it cannot be said as yet to have made a brilliant addition to Japanese literature.

Bibliography.—The following are some of the principal Japanese books of reference: Moritaro Hayashi, 'History of Japanese Literature'; S. Fujioka, 'Complete History of the National Literature' (of the Heian Era); Y. Haga, 'Ten Lectures on the National Literature'; K. Konakamura, 'Brief History of Singing, Dancing and Music'; Toshiro Ihara, 'History of the Japanese Stage'; S. Mikami and K. Takatsu, 'History of Japanese Literature.'

12. Japan—History of Japanese Art. In giving an outline of the history of Japanese fine art it is to be noted first that there are two factors: one which has proceeded from the character and ability of the nation, and the other from the influence of foreign civilization. These two factors, harmoniously blended, have resulted in the distinguishing traits of Japanese art, and brought forth its peculiar charm, so that its characteristics can never be fully comprehended unless we keep these in mind.

The occurences which took place before the Yamato race, the ancestors of the present Japanese, settled on this island in the Far East are concealed in obscurity, although according to the descriptions given in the record there is no question that a certain stage of civilization had already been reached at the beginning of the foundation of the country. Seen from the material point of view, the Japanese ancestors had emerged from trogrodyte habit and dwelt in thatched houses; for dress they wore trousers and hat or crown; used strung jewels for ornament; and farming and sericulture were their occupation. They knew the art of making pottery and manufactured earthenwares, such as vases, shallow dishes, etc. Metallurgy was also known, for they made spears or halberts, swords, bells, mirrors, etc. From the spiritual point of view, they were early characterized by profound reverence for the deity, and the custom of regarding their ancestors with veneration prevailed among them. We learn that they expressed their passion in poetic compositions, and enjoyed dancing and singing accompanied with music. These and various other traditions help us to form an idea of the character and manners of the early Japanese. They respected superiors and elders, being united in clans and families; and if order among themselves was rigorously maintained, there was a beautiful custom of gentle manner. Although they were distinguished by marital spirit, yet they were compassionate and never indulged in savage cruelties; cleanliness was universal; unreasonable obstinacy was looked upon with aversion, and they were frank and sincere. From their lively nature they took pleasure in singing and dancing. Although no particular dexterity in art was to be seen, we have sufficient evidence to show that there already appeared the bud of art. Such was the state of the primitive Japanese tribes. And when we examine the power which contributed to the development of their character and habit, we find that the most potent influence was that of the physical features of the country.

The island of Japan lies in the Pacific Ocean on the east of the Asiatic continent, and extending from north to south it includes many degrees of latitude. As one extremity touches the frigid zone and the other the torrid zone, the natural scenery continuously undergoes kaleidoscopic changes in the four seasons, hence there is no monotony of surroundings. In addition to this, the cold and the warm ocean current rapidly flows around, and the trade and the seasonal winds blow over the land, thus regulating its climate or causing it to change. Above all, the two mountain systems of China and Karafuto (Saghalien) and their branches penetrating the length of the island, and their lofty ridges, covered with thick forest, are everywhere seen piled one upon another. The air, full of moisture that comes from the ocean, strikes these walls and turns to cloud, mist, rain or snow, thus constantly playing wonderful tricks of transforming nature, and the more «lends enchantment to the view» of mountains and waters. There is a lavish variety of fauna and flora. Fine trees and rare grasses, some with lovely flower and leaves, others producing delicious fruits and berries; birds and insects singing and chirping and displaying beautiful plumes—these entrance men's hearts and enrich their imagination. That the Japanese race, being environed with such splendid natural views and influenced by them, and storing up the poetic as well as the artistic thought, should have produced many celebrated masterpieces of art is to be expected as a matter of course. Yet the land is bounded within narrow limits, with no huge mountains, no gigantic streams, no extensive plains and marshes; the climate is not extremely intense; no animals of monstrous forms with peculiarly deep hue or with ferocious and horrible nature are met with; and no plants and flowers of deep color or pungent smell are found; so that the influence which they exercise upon the inhabitants is not very sharp and acute in its character. As a consequence Japanese art is destitute of that profound and imposing trait which defies man's calculation, but consists in pieces of fine plans executed with dexterity and tinged with grace and refinement. Moreover, the mild tempera-

ture, and the fertile soil that yields abundant products, have given the people means for easy subsistence without a violent struggle for life, —thus causing them to acquire a calm and gentle nature.

Besides, the country being isolated from the Asiatic mainland by sea, the nation has been free from foreign aggression and from the evil influences of the Continent. Down to the last days of Tokugawa Shogunate she had little external trouble apart from the wars with Korea, and the invasion she suffered from the Mongols. Even on these occasions victory always lay on her side, and consequently the people have been preserved from prejudice and exclusivism—faults so apt to be found in nations that have frequently experienced hard treatment from victorious invaders. The Japanese have ever shown hospitality to foreigners and have assimilated and profited by foreign civilizations. Nor have the numerous civil wars left the people destitute of feeling or given them a cruel character. The land standing, so to speak, on a group of volcanoes, terrible devastations have often afflicted the nation; yet it has not impaired their optimistic disposition, fostered by the rich bounties of Nature. They even take delight in viewing the strange and majestic forms of the volcanic rocks and use them as materials of poetry and painting.

In short, such noble traits as piety, benevolence, alertness, cheerfulness, artistic inclination, simplicity, purity, bravery, sobriety and straightforwardness, may be found in abundance among this nation. Moreover, they are wonderfully clever in the use of their fingers, shown in a variety of artistic employments. They are not a people of profound speculation, but are highly gifted with intuitive insight, and assimilative and ameliorative capacities. These national characteristics are manifest through the entire history of Japanese art, and constitute its main features.

As has been stated, the Japanese love sobriety and simplicity and are by nature disinclined to ostentation. Hence their productions are marked by grace as well as skill. We can readily see that the young shoots of Japanese art sprang up in the earliest period of their national existence, though owing to the want of necessary encouragement their growth was not rapid.

The oldest forms of artistic design seem to have been ornaments used in decorating dress, weapons, tombs, coffins, and articles employed in religious ceremonies. This may be proved by various archæological relics, discovered in many districts. They have, however, little artistic merit, and are only valuable as throwing some light upon ancient art—for showing us specimens of original and purely Japanese art.

From the very outset of authentic history the Japanese commenced intercourse with the Koreans, and the latter's civilization, primitive as it was, at once began to influence the former, but not so much as to accelerate the development of their art. The subjugation of Korea by the heroic Empress Jingo (201 A. D.) bound Korea to send annual tributes to Japan, and through this channel the art and industry of the Continent flowed into the island Empire. Later, in the reign of Ojin, Pep-che (Kudara), one of the three Korean states, introduced to Japan the literature of China. This event marks a great epoch in the history of Japanese civilization; after that every institution was copied from China, artisans were invited, and during the reign of Yuryaku, In-sa-ra-a (Inshiraga), a painter of Pep-che, was employed. In the 13th year of the Emperor Kimmei (A. D. 552) the King of Pep-che presented a statue of Buddha, a copy of the sacred canon, and several articles of ornament such as banners and canopies. The statue had been made in China after the «Six Dynasties' style,» and it was the first Buddhist image to come to Japan. With these presents Buddhism found its way into the Empire, and became an important factor in the progress of Japanese art.

The civilization of the Asiatic Continent has so strongly influenced Japanese art that, since its first introduction, its every wave and billow have left some trace on the art of Japan. Thus the ancient art of China and Korea opened the way for the artistic progress of Suiko's reign, and the flowery times of the T'ang dynasty had their counterparts in the age of the Emperors Tenchi, Shomu and Kwammu. And if we take into consideration the fact that during the «Six Dynasties,» and the dynasties of Sui and T'ang, China already had close intercourse with India, which, in its turn, was in contact with Greece and Rome, we may justly say that the early civilization of Japan was indirectly connected with those of Europe and India. During the age of the Fujiwara's regency Japanese art began to assume a definite form and even developed certain distinct features, but subsequently in the age of the Kamakura and Ashikaga Shoguns, Chinese influence (Sung and Yuan dynasties) became once more remarkable. However, it was not of long duration; for in the Toyotomi and Tokugawa régimes national art again took its own course, though we must not neglect the fresh effect produced on it by the new civilization of Ming and Ching dynasties.

Thus we see the great and constant influence of foreign civilizations on the artistic history of Japan, yet it would be a gross error to regard Japanese art as nothing but an imitation of the arts of India, China and Korea, and that .without these prototypes Japanese art would never have existed or would never have emerged from its prehistoric stage. There would be nothing wrong in calling Japanese art a branch of Oriental art, but it has a nobler mission than being a mere branch—it aims at extracting the essence of Oriental art and constructing it on a purified and ennobled basis. Though it has been guided and encouraged by exotic arts, it has never been a blind follower: it has digested them and, at the same time, has well preserved its own individuality.

India, China and Korea have all failed to stem the tides of foreign aggression; their national existence has been destroyed or threatened, and their old civilizations have been wiped out. The result is that it is impossible to admire their ancient glory or to recover their old treasures among the crumbling ruins. Japan, on the contrary, having remained immune from any of these disasters, her oldest productions are still extant, and even foreign

objects of artistic and historic interest may be found within her boundaries. And since every step of the development of her art may be distinctly traced, its study will afford an insight into the artistic history of the foreign nations with whom she has been in contact. Indeed it is no exaggeration to say that the cream and essence of Oriental art has been preserved nowhere but in Japan, and by its people it will be worked to perfection.

Would it be possible to name the characteristics of Japanese art—the features underlying all its branches: painting, sculpture, architecture, industry, etc? We may mention the following three. The first is mildness and pure simplicity. Coloring is for the most part sober and plain, and very seldom gorgeous. Japanese art prefers moderation and genial ease to excessive grandeur; sobriety and chastity to profundity, intensity, and vulgarity. Even such horror-inspiring subjects as the pictures of hell are not thrilling in effect. The statue of Buddha at Nara is grand, but it is only the high-water mark of Continental influence, and does not represent the pure Japanese disposition.

The second characteristic of Japanese art is its exquisite lightness or delicacy. This is due to the joyful frame of the people's mind, and to the wonderful dexterity of their hands. There is no artistic product but is marked by charming workmanship.

The third feature is its idealism in representation. Japanese art is not realistic, it does not aim at photographic accuracy, but by the free and bold exercise of imagination it tries to abstract the essential aspect of objects, and to give expression to the artist's sentiments by its portrayal. It is for this reason that form is comparatively little regarded, while idea is considered all important; that it is weak in realistic delineation and strong in decorative design. These three points underlie all Japanese art and distinguish it from the art of other Oriental nations.

With regard to the division of the history of Japanese art the opinions of scholars vary a great deal, so much so that it is an utter impossibility to settle the question definitely once for all, marking the beginning and the end of each period with absolute certainty and precision. Yet, in following out its development, it will be both convenient, and in some measure be justifiable, to divide the whole period into 12 portions, each signalized by a wave of progress and characterized by some special feature. It is to be remembered, however, that the treatment of the subject is necessarily short and summary owing to the limitations of space. And again, the title of each epoch is given for practical convenience and is not always identical with its namesake in the classification of political history.

1. The Age of the Empress Suiko (540-644 A. D.). 2. The Age of the Emperor Tenchi (645-723 A. D.). 3. The Age of the Emperor Shomu (724-781 A. D.). 4. The Age of the Emperor Kwammu (782-888 A. D.). 5. The Age of the Fujiwara's regency (889-1086 A. D.). 6 The Age of the Ex-Emperor's regency (1087-1183 A. D.). 7. The Age of the Kamakura Shogunate (1186-1392 A. D.). 8. The Age of the Ashikaga Shogunate (1393-1573 A. D.). 9. The Age of the Toyotomi's Supremacy (1574-1614 A. D.). 10. The First Age of the Tokugawa Shogunate (1615-1744 A. D.). 11. The Second Age of the Tokugawa Shogunate (1745-1867 A. D.). 12. The Meiji era (1868— A. D.).

FIRST PERIOD.

The Era of the Empress Suiko.—(540-644 A. D.—The æsthetic sense inherent in the Japanese race long remained latent and undeveloped. Not until the middle of the 6th century did the artistic endowment, or rather art-loving potentialities, of the people begin to reveal themselves in the land of the Rising Sun. The beginnings of the study of pictorial and glyptic art—the first page, as it were, of the history of Japanese art, must be dated from the time of the Emperor Kimmei when the civilization of the «Six Dynasties» of China (265 to 617 A. D.) was introduced through Korea and with it Buddhist images and sacred books were brought over to the country. Later, in the reign of the Empress Suiko, the Empress herself became a devout believer in Buddhism, Prince Shotoku being no less enthusiastic a votary. With the object of propagating the religion through the land they invited famous priests and Buddhist sculptors from Korea, and by their order many images were made, and temples and pagodas built in large numbers. Thus, under the Imperial patronage Buddhist art made rapid and signal progress.

In architecture the first work that calls for special notice was the construction of a monastery consisting of seven buildings (Shichidogaran), part of which grand work is still to be seen in the Kondo (Golden Hall) of the Monastery of Horyuji, Nara.

The native artist who crowned the first great progress of Japanese sculpture was Kuratsukuri-no Tori. One of his greatest works, the bronze statues of Sakyamuni and two attendant disciples (Shaka-Sanzon; 'Shimbi Taikwan,' Vol. I.), are still preserved in the Kondo of the Horyuji. The wooden image representing a Goddess of Mercy (Kwannon, *i. e.* Avalokites'vara; consult 'Shimbi Taikwan,' Vol. X.) in the Yumedono («Dream hall») of the same monastery, attributed to the chisel of Prince Shotoku, is of the same style of homeliness and simplicity. Pictorial art had not yet been fully developed. Many families of painters had sprung up, however, and were engaged in the work of decorating Buddhist images and shrines. The so-called «mitsuda» picture (a picture painted with several pigments mixed with the juice of a plant called «mitsuda,» which grows in India and other tropical countries) of the Tamamushi shrine in the Horyuji (consult 'Shimbi Taikwan,' Vol. II.) and reputed to be the oldest surviving specimens of the kind in the east, is fantastical in design, being a sort of pattern, and is, besides, plain in delineation and simple in coloring.

Of applied art the most advanced were bronze casting, sculpture on metal, and metal tempering; while textile fabric and embroidery had not attained a high degree of excellence; decorative arts on the other hand, achieved a great development. In fine, the art of this period

is traceable to the Buddhist art of India introduced through China and Korea; and there is evidence that not a few of the works belonging to this era were produced by Chinese and Korean immigrants.

SECOND PERIOD.

The Era of the Emperor Tenchi.—(645-723 A. D.)—During this period, busy intercourse having been established between Japan and China, the latter's civilization found its way direct into the former without passing through Korea as had hitherto been the case; most of Japan's institutions, laws, literature and religion were accordingly remodelled on those of China; and this, in no small degree, helped the development of various branches of art. Besides, as native artists had in the course of time acquired great dexterity in their workmanship the works produced during this period are characterized by grandeur and magnificence, and are deeply instinct with a serene and noble spirit. The famous sculptors, Yamakuchi-no-atai Oguchi and Yakushi Tokuho, flourished in the reign of the Emperor Kotoku. One of his greatest works, the images of the Shitenno (the guardian gods of the four regions; consult 'Shimbi Taikwan,' Vol. IV.), is now in the Kondo of the Horyuji, and though the work does not emerge from the stage of plainness and simplicity, yet the features are mild and graceful. The images of Amitabha and two dependent Bodhisattvas (Amida-sanzon; consult 'Shimbi Taikwan,' Vol. III.), a relic of the era of the Emperor Tenchi, and said to have been worshiped by Lady Tachibana, are distinguished by the fine workmanship of their halo and backscreen as well as by the gracefulness of their form and features, bearing testimony to the refinement and elaborateness attained by the fine arts of the epoch.

During this era the style of the T'ang dynasty rapidly gained ground, and influenced things in general, and art objects in particular, with the result that great works stamped with solemnity and elegance were produced, the images of Sho-kwannan (Arya Avalokites'vara; consult 'Shimbi Taikwan,' Vol. III.) and the «Yakushi-sanzon» (Bheshajya-guru and two dependents: consult 'Shimbi Taikwan,' Vol. V.) in the Kondo of the Yakushiji being among the best.

Toward the end of this period the art of modelling in clay increased with rapid strides, the «Nehan-zo» (image of Buddha entering Nirvana; consult 'Shimbi Taikwan,' Vol. IV.) in the pagoda of the Horyuji, being a specimen of the work. Keimonye and Keishukun, both sculptors of great note flourished in this period. Among the specimens of pictorial art is the mural picture in the Kondo of the Horyuji, representing the «Shibutsu-jodo» (the Paradises of Four Buddhas; consult 'Shimbi Taikwan,' Vols. II. and XV.) and famous for bearing resemblance to the old picture found in the temple of the Ajanta Cave, in India. In its pattern is visible, in no small degree, a mixture of the Indian and the Greek style. Showing, as it does, traces of great power of line, color, and composition, the picture is, indeed, a rare treasure of Oriental art.

Moreover, as the demand of the Imperial Court for furniture, ornamental dresses and decorative pictures increased, departments relating to various branches of art were instituted with the object of encouraging the people to cultivate the fine as well as the useful arts.

Architecture made a great development and attained a high degree of refinement. Unfortunately few, if any, examples of this art have been preserved, the east Pagoda of the Yakushiji, in fact, being the sole existing specimen of the work.

THIRD PERIOD.

The Era of the Emperor Shomu.—(724-781 A. D.)—The civilization of the T'ang dynasty, introduced and copied in the preceding era, reached its highest point in this; the erection of Buddhist images, and the construction of temples and pagodas were carried out extensively; and fine arts and various technical industries made noticeable progress, furniture, utensils and even playthings being made as showy and gorgeous as possible. The most celebrated monument representative of this glorious and flourishing epoch is the bronze representing Vairochana Buddha in the Todaiji. The statue is in a sitting posture and matchless for its colossal size, the height of the body being 53 feet 5 inches, the length of the face 15 feet, and all the other parts being proportionately gigantic. It is to be regretted, however, that having undergone several repairs in later ages, it has lost a great deal of its original form. The founder was Kuninaka-no-muraji Kimimaro.

The art of making clay and dry-lacquered images made striking progress during this period, and attained a high degree of elaborateness and refinement. Among the specimens of the former are the images of «Shitenno» (Four guardian gods; consult 'Shimbi Taikwan,' Vol. I.) in the Kaidan-in of the Todaiji, and the image of «Vajrapani» in Hokkedo of the same temple (consult 'Shimbi Taikwan,' Vol. VIII.); while the «Bonten» (God Brahma; consult 'Shimbi Taikwan,' Vol. III) and the «Taishakuten» (Indra; consult 'Shimbi Taikwan,' Vol. X.) in the Sangatsu-do of the Todaiji, and the «Kwannon» (Goddess of Mercy) in the Denbodo belonging to the Horyuji (consult 'Shimbi Taikwan,' Vol. XV.) are the most celebrated surviving examples of the dry-lacquered images.

Of the wooden images the Juichimen-kwannon (Ekadasamukha Avalokites'vara) in the Hokkeji (consult 'Shimbi Taikwan,' Vol. II.) is the most perfect, being graceful and elaborate.

The works of this period are signalized by a harmonious combination of reality and imagination and by the well shaped forms of the bodies of the postures and of the foldings of the garments; while expression was by no means neglected.

Pictorial art also made a remarkable advancement in this era. The screen picture representing a beauty under a tree, in the possession of the Shoso-in of the Todaiji (consult 'Shimbi Taikwan,' Vol. XV.) and the Kichijotennyo (Goddess of Fortune, Sri) of the Yakushiji (consult 'Shimbi Taikwan,' Vol. II.) show that they were executed with a masterly

caligraphic touch, both their faces and bodies being full of elegance and gracefulness, and especially the latter picture displays a gay and gorgeous coloring. The works of architecture were for the most part on a grand scale. The interior of the Hokkedo of the Todaiji, the Kondo of the Toshodaiji and the Shin-yakushiji all bear the marks indicative of the special features of this branch of art as prevalent in the period.

As for the progress of applied art it was simply wonderful. In this connection special mentions must be made of the treasure-house belonging to the Shoso-in of the Todaiji. There are kept in this store nearly three thousand articles, all being specimens of fine and applied arts of this era; bronzes, textile fabrics, embroidery, sculptures, inlaid work of gold or silver, lacquer works, glass, enamel ware, mother-of-pearl lacquer works, gold-dust-sprinkled lacquer work, paintings of «mitsuda» (a kind of oil pigment) and Koketsu (a kind of dyeing) being well represented here. It will be seen that during this period many branches of applied art attained the highest degree of elegance and refinement, while their decorative patterns and figures were freely drawn from Chinese or Indian stories and events.

The gong called «Kwagenkei» with its stand is to be counted among the masterpieces of this epoch by virtue both of its fine shape and its elegant casting (consult 'Shimbi Taikwan,' Vol. V.).

FOURTH PERIOD.

The Era of the Emperor Kwammu.—(782-888 A. D.)—Soon after the accession of the Emperor Kwammu to the throne the capital was removed to Yamashiro (now Kyoto); the Imperial palace built after the fashion of the T'ang dynasty; government was remodelled on Chinese plan, and various institutions reformed. Things took a new turn and the prosperity of the country greatly increased. What was more, this period produced such great priests as Saicho and Kukai. The former was the founder of the Tendai sect; the latter of the Shingon sect. They endeavored to spread the teachings of Buddha with great assiduity, enlightened the people and helped them into great activity. Such being the case, the fine arts of this period were signalized with a lofty and majestic idea. Kukai, or Kobo-daishi as he was called, was an accomplished priest of profound learning, and produced not a few excellent works of painting and sculpture. Among the specimens of his work is the image representing the deity Fudo (Achara) in the Toji, Kyoto (consult 'Shimbi Taikwan,' Vol. I.). The picture representing the priest Gonso, in the Fumonin, Koyasan (consult 'Shimbi Taikwan,' Vol. VI.), and the portraits of Nagarjuna and Nagabodhi in the Toji, attributed to him, are executed in noble and refined taste, and marked with elegance and grandeur (consult 'Shimbi Taikwan,' Vol. XII.). Saicho (Dengyo-daishi) was also a very learned and highly accomplished priest, credited with a great genius for painting and sculpture. The priest Enchin painted the Achara mostly; the Red Achara in the Myohoin, Koyasan, being his greatest work (consult 'Shimbi Taikwan,' Vol. VIII.). Beside Buddhistic paintings, artists of the time began to take up human figures, landscape, birds and flowers for subjects of pictures. Kudara Kawanari was a great master of painting of this kind.

Of the specimens of the sculpture of this epoch the image representing the Goddess of Art (Gigei-tennyo) and that of Bodhisattva Kudatsu in the Akishinodera, Yamato, are the finest relics we now have, being the most graceful and the least conventional, while delicately expressive and inspiring loftiness and grandeur (consult 'Shimbi Taikwan,' Vols. II., VI.). Besides these there are not a few masterpieces in this line.

Architecture made a great progress with the laying out of the new capital at Kyoto, the Imperial palace and various offices built after the T'ang fashion being extremely fine and elegant. The construction of the Imperial palace was for the first time brought to perfection, and what was called the «Dai-dairi» (Court) style came into existence. The Tendai and the Shingon sects introduced a new feature into the construction of the temples, and the establishment of the incarnation theory («Shin-butsu-dotai-setsu,» *i. e.* theory that identifies Japanese gods with Buddhas) gave a certain Buddhist architectural style to the building of Shin-to shrines. The «Shimmei-tsukuri,» *i. e.* the ancient style of shrine-building, gave place to the new ones, the «Kasuga-tsukuri» and the «Nagare-tsukuri.» And, though the progress made by applied art during the period was not very conspicuous, the lacquer work industry attained a great development.

FIFTH PERIOD.

The Era of the Fujiwara Regency. (889-1086 A. D.)—The epoch of the Fujiwara Regency was indeed a glorious period, stamped with great national development and prosperity: the nation at large flourished, and not a few customs and manners were formed and reached maturity. In the reign of the emperor Uda the practice of despatching envoys to China was discontinued, and in consequence the impetus from without ceased to come. The civilization which had found its way into Japan in the preceding age was fully assimilated in this, and Japan developed a new native style of her own. Moreover, the luxurious life led by the Fujiwara family and the great prevalence of Buddhism at that time conspired to help the advances of both fine and industrial arts, cultivating such special qualities as beauty, elegance, severity and refinement. In the early part of this period flourished Kose-no Kanaoka, the greatest pictorial artist the country had yet produced. He was famous for his pictures of Buddhist divinities, human figures, landscape, birds and flowers, all of which were said to be delicately fine and elaborate. Unfortunately, however, almost no specimens of his work have come down to the present age. But collating all the traditions circulating about him we gather that he was a great master of pictorial art, especially skilful at painting pictures of animal life, his representations being true to nature; he seems to have struck a new style of his own, apart from those of the T'ang fashion. His descendants succeeeded him and founded the Kose

school, Kimmochi and Hirotaka being among the most celebrated members of the line. The picture representing the Prince Shotoku and his two attendants, in the collection of Viscount Saisho (consult 'Shimbi Taikwan,' Vol. XVII.), attributed to Kanaoka, is an excellent specimen indicative of the characteristic gracefulness and elegance belonging to the early part of this period.

The priest Eri and Asukabe Tsunenori are believed to have been great masters of painting of this epoch. The priest Eshin, one of the promoters of the «Pure Land» doctrine,* mostly painted pictures of Amitabha Buddha, welcoming the devotees who come to his Paradise (Amida-raiko), his style being purely Japanese. The picture of Amitabha and the 25 Bodhisattvas, still preserved in Koyasan, is a great piece of work attributed to his brush (consult 'Shimbi Taikwan,' Vol. IV.). Takuma Tamenari is celebrated for his pictures on the walls and on the panels of the doors of the Howodo, Uji (consult 'Shimbi Taikwan,' Vol. IV.). Takumino-kami Fujiwara Motomitsu, a great master of painting, is looked on as the founder of the Kasuga school. Sculpture came to develop a native style in due time, culminating in the work of the celebrated Jocho, who improved the characteristic features belonging to the sculpture of this period and introduced elegance, gracefulness and refinement into this branch of art.

The image of Amitabha, in the temple of Hokaiji, Yamashiro, is believed to have been a production of the later part of his life (consult 'Shimbi Taikwan,' Vol. XVI.). His son Kakujo and pupil Chosei succeeded him, each founding an atelier for religious sculpture.

Architecture also developed a new native style; temples were built in such a way as to present an elegant and graceful appearance on the outside, while the inside was superbly decorated with mother-of-pearl lacquer work and gold-lacquered work. Of the specimens of the architecture of this period the monastery Hosshoji constructed by the order of Fujiwara Michinaga is the most magnificent and the finest, built on a grand scale. Howodo in Uji and the Konjikido (Golden Hall), in the Chusonji, Hiraizumi, Rikuchu province, both of which are still preserved, though built on a very small scale, yet reflect something of the general style of architecture prevalent in this era. The mansions of noblemen were built after what was termed the «Shinden-tsukuri» (Sleeping-chamber-style), a grand and imposing style of architecture, and in the construction of the Imperial palace arose the «Satodairi» (Village-court), an informal and much simpler style than the «Dai-dairi» (Court). A native style began to stamp itself in dresses and furniture of all descriptions, affecting their shape and decoration not a little.

Lacquer works, textile fabrics, and metal works abounded in elegance and tastefulness, and were free from conventionality, breathing loftiness; design became richer and more ingenious; workmanship and technique were carried to a high degree of elaboration and refinement; and not a few specimens of the work stamped with these noble qualities have come down to the present age.

*"Pure Land" (Jodo) sanskrit "Sukhavati," the Paradise of the worshippers of Amitabha.

SIXTH PERIOD.

The Era of the Regency of Ex-Emperors.—(1087-1183 A. D.).—The customs and manners which had been formed and had reached maturity in the preceding era attained a still greater development in this. Things were, on one hand, getting effeminate and conventional; while, on the other, reaction having already set in with the changes of the times, a lively and vigorous style began to assert itself. The power of the Fujiwara family had, indeed, been on the wane; but the Taira family, who had taken their place, having succeeded to their luxury and extravagance as well as to the political ascendancy, and having devoted their energies to the cultivation of belles-lettres, fine arts and technical industries did not show any sign of decline, and demand for arts-objects did not decrease in the least. In pictorial art Fujiwara Takayoshi originated a new style characterized by elegance and delicacy. The Genji-Monogatari-Emaki* is the existing specimen of his work. He was followed by his son Takachika, and it was in the time of Tosa-no Gonnokami Tsunetaka that the school bore the family named Tosa. Kakuyu or the «Bishop of Toba,» as he was popularly called, had already started a new style, and painted a number of caricatures with a masterly caligraphic touch. His work Choju-giga-no maki (a collection of burlesque sketches of birds and beasts) is very well known (consult 'Shimbi Taikwan,' Vols. I.-IV.). Mitsunaga is famous for his marvelously powerful brushwork, and has left us the Bandainagon-Emaki (a pictorial scroll representing the life of the courtier Ban (consult 'Shimbi Taikwan,' Vol. XIV.). Takanobu was a master of portrait painting. The foundation of the old Tosa school, representative of pure Japanese painting, is to be ascribed to these great artists.

During this period the practice of loving pictures for their own sake obtained, and demand for beautiful pictures besides those painted for religious or decorative purposes grew larger and larger, pictorial scrolls were made much of. Taste for arts-objects was much cultivated among the upper classes, and there arose, in consequence, peculiar styles, such as the «Tsukuri-ye» («making-up pictures») and the «Ashide-ye» (pictures painted with *Kana* characters), while the game called «Ye-awase» (picture-setting) was in great vogue.

The sacred book dedicated by the Taira family to the Itsukushima shrine bears witness to the artistic taste of those days, being ingenious in design and beautiful in decoration (consult 'Shimbi Taikwan,' Vol. VII.). As for sculpture, though the descendants of Jocho kept up the traditional style of the family, yet it became more elaborate and showy, losing much of the loftiness and grandeur as shown in the works of previous ages. Architecture and other branches of applied art grew more and more delicate, and came to lack in strength and vigor.

*The picture scroll representing the novel of Lady Mursaki Shikibu.

SEVENTH PERIOD.

The Era of the Kamakura Shogunate.—(1186-1392 A. D.)—By the time Yoritomo originated the Shogunate at Kamakura, the spirit of simplicity and strength, characteristic of the military class of the time, naturally also found its vent in the works of art; their pervading features are force and manliness. The Zen (Dhyana), *i. e.* «meditation,» sect of Buddhism which was introduced into Japan in this period, along with the then established Nichiren sect, with their astute doctrine, were not without their influences on the artistic productions of the age. The carved figure, so full of robustness, by the Buddhistic sculptor Unkei and his son Tankei, are most representative of its spirit. Even a great advance in faithfulness to nature and skill of expression is noticed in their works, among which the statues of the two guardian kings (Niwo) at the gate of the temple Todaiji, are looked upon as the now existent chef-d'œuvre (consult 'Shimbi Taikwan,' Vol. II.).

Among the followers of the Unkei school of sculptors Jokei and Koben are to be mentioned. Kwaikei, also known as Annami, adhered to the older style of sculpture, and carved many statues of Amitabha.

As for the pictorial art, the characteristically Japanese modes of design and execution made a further development and manifested a great amount of activity. The Tosa school could boast of such great names as Sumiyoshi-Keion, the author of the 'Illustrated Scroll of the Heiji-Monogatari' (according to a certain tradition, this is attributed to Hamuro Tokinaga, but it is not credible; consult 'Shimbi Taikwan,' Vols. V. and X.); Nobuzané to whom the authorship of the illustrations in the 'Kitano-Engi' (consult 'Shimbi Taikwan,' Vol. IX.), and of the 'Illustrated Scroll of the Eigwa-Monogatari' is attributed; (consult 'Shimbi Taikwan,' Vol. IV.); Yoshimitsu, the author of the 'Illustrated Life of Honen-Shonin' (consult 'Shimbi Taikwan,' Vol. VIII.); En-i, the author of the 'Illustrated Life of Ippen-Shonin' (consult 'Shimbi Taikwan,' Vols. II., XII.); Nagataka, the author of the 'Sumiyoshi-monogatari' (consult 'Shimbi Taikwan,' Vol. VIII.), and the 'Illustrated Scroll of the Mongolian Invasion;' and Takashina Takakané, the author of the 'Illustrated Scroll of Kasuga-Gongen-Kenki' (miracles of the deity of Kasuga); consult 'Shimbi Taikwan,' Vols. V. and VIII.).

The Kose School continued to supply us chiefly pictures concerning Buddhism, Arihisa being the most famous of its supporters. Korehisa, although originally an artist belonging to this school, made a departure from it. The well-known 'Illustrated Scroll of the Later Three-Year-Campaign' is from his brush.

Shoga, a master belonging to the Takuma School, chiefly produced the Buddhistic pictures. Later on, Yeiga of the same school, made a study of the Chinese masters, such as Li Lung-Min of the Sung Dynasty, and Wan-Hui of the Yuan dynasty. The picture of the Arahats (saints) was his favorite subject.

Near the close of the period now under consideration, a kind of ink-drawing introduced by the Zen (Dhyana) priests who had been to China under the Sung Sovereigns, came gradually to find in Kawo, Mokuan, Myotaku and others its able propagators.

From the architectural point of view, we must observe that side by side with a new style of building as shown in the Dhyana temples there arose in Kamakura a plain form of private dwelling, known as the «Buke-tsukuri» («Military style»).

The troubled state of the times necessitated the manufacture of warlike implements, and great progress is noticed in the making of armors and swords. Lacquer work also made a considerable advance. And it is during the Kamakura period that Kato Shirozaemon originated the Seto pottery on his return from China where he went to learn the ceramic art.

EIGHTH PERIOD.

The Era of the Ashikaga Shogunate.—(1393-1573 A. D.)—The period that followed the reunion of the Southern and the Northern branches of the Imperial line of descent was one of exorbitant luxury, in which the Shoguns of the Ashikaga family were sybarites enough to live. The astounding indulgence which marked out Yoshimitsu and Yoshimasa from among other extravagant Shoguns of the time did much to enhance the great developments both in arts and industry.

It is, however, not to be forgotten that the austere simplicity and directness of the Dhyana doctrine also fostered a taste for serene beauty among the people and that the tea ceremonial was very much in vogue as a form of its expression in the daily life. Hence the studied avoidance of wild luxuriance in the works of art of the period. The pictorial art of the Ashikaga times was totally under the influence of the Sung and Yuan masters. Priest Myo-Cho drew his Buddhas and Chinese Sages, closely following the modes of delineating things as seen in the pictures of the Takuma school and those of the Sung and the Yuan dynasties. When the ink-drawing had begun to make its way among Japanese artists, among its votaries were Priest Josetus and his disciple Shubun in the Oei period. These two gradually formed their own school by an eclectic of the Chinese masterpieces. Among their illustrious followers are Shinno, Jasoku, Sesshu, Sotan, Shingei, Shinso, Shokei, and Masanobu.

Of all these well-known names that of Sesshu is most conspicuous, his works giving tests to his exquisite way of brushing as well as his fullness of manly strength. Indeed, he may be said to be the greatest artist Japan had yet produced, his works being marked by great sublimity. Masanobu is the originator of the Kano school. His son Motonobu made a deep investigation of the Sung and the Yuan masters, which he deepened by a study of the technics peculiar to the Tosa school. That is how he came to complete what his father had begun. The Tosa school had dwindled into common place during this period, and Mitsunobu was the only artist of the line who breathed a new life through his assimilation of the Sung mode of delineation. Sculpture showed a sign of decay in this period. No great names honored once so flourishing a branch of art. Nobleness of features which characterized the Buddhistic images was not to be seen in

the new productions, whose very fineness of outward form only suggest effeminacy and formality. It is to be specially mentioned, however, that a new activity arose in the carving of the masks for the No-dancers—a phenomenon that appeared as an outcome of the rise of the lyric drama.

In the field of architecture, the Dhyana style of Buddhistic edifices had reached its perfection, and the so-called «Shoin-dzukuri» («Study-room-style») was called into existence. The manner of building the room where the tea ceremonial was to be exercised was something wholly unknown in the former periods and as a consequence greatly affected the style of gardening.

All forms of industry had made great progress through the increased demand and encouragement on the part of patrons. The making of armors and swords as well as the peaceful art of decoration was successfully carried on by their respective masters. Plain, gold or silver lacquering too came to be practised with wonderful skill and art. The great zeal with which the fashionable arts of the tea-drinking and the incense tournaments were pursued proved a most favorable stimulus for the production of the much-famed examples of the ceramic art. Many exquisite works of this period came from the furnace of Shozui, who visited China to learn how to make the céladon porcelain from the Ming artists.

NINTH PERIOD.

The Era of the Toyotomi.—(1574-1614 A. D.)—Toward the close of the Ashikaga period the Empire was thrown into a state of utter confusion, but when Oda Nobunaga gained the controlling power over Japan and was subsequently succeeded by the great Taiko Hideyoshi, the dashing disposition and the extravagant taste of the people strongly tinged the different lines of art. But this *zeitgeist* and its consequent effect on fashion was, in some measure, counteracted by the prevalence of *chanoyu* («ceremonious tea-making»)—an art which, under the strenuous encouragement of Hideyoshi and the devoted enthusiasm of those who took interest in it, attained to a high degree of artistic excellence. It even affected the style of architecture and industry.

In this period the paintings of Kano Yeitoku were characterized by strong force and free use of his brush, and brilliancy of color. His works were immensely admired by the warrior class and used in decorating magnificent edifices. He had three disciples: Sanraku, Koyetsu, and Yusho. He first modified the style of the old Tosa school and made a style of his own. Furthermore, he improved upon *makiyé* (gold and silver lacquer) by his noble and unique designs, and his representations of popular scenes prompted the oncoming of the *ukiyoyé* school.

In architecture, Hideyoshi's two castles, Momoyama and Juraku, were the most magnificent. The daimyos, too, took pride in the splendor of their castles. The construction of Shinto shrines also was gradually improved, until what was called the *yatsumuné-dzukuri* (buildings consisting of eight edifices, large and small) edifices was invented. It has been charged that the Buddhist temples of the Shin sect are wanting in solemnity, but in magnitude they are seldom equalled. In the construction of tea-rooms the greatest elegance of taste was displayed, and gardening, too, underwent a favorable change. In sculpture there were few great productions, except those that were employed in ornamenting buildings. The latter part of this age, however, brought forth the famous sculptor Hidari Jingoro. It may be worth mentioning that remarkable skill was exhibited in the carving of No masks. As to manufacturing art, apart from the encouragement afforded by the extravagance of the daimyos and the general prevalence of tea-making, the great influx of foreign articles through the merchants of China, the Malay Archipelago and Western countries stimulated the progress of all branches of Japanese art.

TENTH PERIOD.

The First Period of the Tokugawa Shogunate.—(1615-1744 A. D.)—With the firm establishment of the Tokugawa's supremacy, the literature and art of Japan took a long stride; and as the Empire had enjoyed tranquillity for many years people in general became effeminate and weak-spirited through excessive devotion to literary pursuits, while the plebeians raised the condition of their living owing to the growth of their wealth. The result was that the fashion and the taste of those days were, to a great extent, modelled by the fancy of the lower but comparatively rich plebeians. Accordingly, art and industry gradually departed from their old fashion of grandeur and magnificence, and assumed milder and more plain aspects.

At the beginning of this period, however, the trace of the foregoing age was still perceptible; for even in the vivid *ukiyoyé* painting of Matabei and the superb style of Sotatsu's decorative pictures there was a touch of vigor and grandeur. But as the age gradually ripened and fancy deepened the so-called Genroku fashion unfolded all its glory.

Among the artists Tannyu held a very prominent position. He studied both Chinese and Japanese art and formed a novel style distinguished for the broadness of subjects and plainness of treatment, while Naonobu, Yasunobu, and Tsunenobu contributed to extending the influence of his school. Sansetsu, remaining in Kyoto, faithfully preserved his ancestors' style; Mitsuoki improved upon the old Tosa style by blending in it the brush of the Chinese masters; Jyokei and his son Gukei revived the Sumiyoshi school; Hanabusa Itcho, choosing his themes in the scenes of daily life, depicted light and charming pictures; Motonobu with his peculiar beauty and grace of treatment secured the foundation of the *ukiyoyé* school. Choshun, Kwaigetsudo, Masanobu, and Kiyonobu formed a group by themselves, while Sukenobu worked independently. Korin, the great genius and unequalled decorative painter, applied his art to lacquer work, while his younger brother Kenzan achieved the highest fame for his graceful paintings on porcelain wares.

In this age sculptors chiefly put their efforts into microscopic details; hence diminutive works of rare merit—such as *Netsuké*—were

produced, but larger works like Buddhist statues continued to decline. Of the sculptors who made a specialty of carving Buddhist statues Tankai Risshi and Shimidzu Riukei alone were celebrated. Carving came to be widely used in the decoration of buildings, but the style grew too complex.

In architecture, a new mode of construction called the «gongen-tzukuri» found its rise. This mode had more tendency to monastery style than the *Yatsumune-tsukuri,* the former being an advance upon the latter. However, though it surpassed the older styles in sectional detail, it lost in general sublimity. The temples at Nikko and Uyeno best reflect the type of that age. Side by side with the growth of luxurious taste among the people and of scientific and technical progress, all other lines of art and industry attained to higher excellence.

ELEVENTH PERIOD.

The Second Period of the Tokugawa Shogunate.—(1745-1867 A. D.)—When Iyeshigé, the Ninth Shogun of the Tokugawa House, entered upon his office, the general fancy in Yedo had tended towards greater pomp and vulgar splendor; but in Kyoto quiet and chaste literature and art rose into ascendency, and the two capitals presented a strange contrast. The Kano school, adhering to its old rules with overstrictness, was, as it were, fossilized, and produced no fresh masters; but *ukiyoyé* gained greater popularity, and its masters Shunsho, Harunobu, Utamaro, Toyokuni, Keisai and many others competed with one another in painting bright and attractive pictures. Indeed the demand for their works was such that it called forth the invention of color-printing from woodblocks. Hokusai enlarged the range of painting, and covered with his skill all objects of natural and social existence. Hiroshigé was renowned for his landscape painting, and the pictures he depicted for woodcut reproduction had a peculiar charm. Shiba Kokan imitated European painting and also made some attempts at copper-plate pictures.

The influx of Ming and Ching institutions affected the Kyoto artists. Ginankai, Chitaiga, Shabuson, were renowned adherents of the Southern school, and it was by their stimulation that the celebrated Maruyama Okyo founded his realistic school, thus making quite a new phase in the art of Japan. Goshun, originally a pupil of the Southern school, opened the Shijo school. Besides them, Shiseki, Shoko, Jakuchu, Sosen, Ganku, Zaichu, Chikuden more or less copied the style of Ming and Ching painting. By and by their art influenced the artists of Eastern Japan as may be observed in Buncho and Kwazan. Towards the end of the Shogunate, Totsugen and Ikkei and some others revived the old Tosa school, and from it Yosai's brush supervened. In industry, the simple articles fashioned after the taste of literary men came into popularity, whereupon many artisans took their models in Ming and Ching manufactures.

TWELFTH PERIOD.

The Meiji Era.—(1868—.)—The advent of the Meiji Restoration completely destroyed the feudal system and swept away the old atmosphere. The country was thrown into the midst of the world's great tide, and the general commotion arising therefrom was so violent that both art and literature fell into a temporary lapse. Soon, however, as the Imperial rule manifested its beauty, they once more commenced activity and progress, and are now ready to make a bold flight. Only 40 years have elapsed since the grand national metamorphosis, but in that short space of time the nation has digested every department of Western civilization with such admirable skill as to surprise the whole world. Yet, whatever the material progress of Japan may have been, her art and literature are still in a state of transition, and it is impossible to foretell their future. We have no doubt, however, that the nation will blend all the best points of the East and the West with the signal success which has marked its past efforts, and bring out a new product of indescribable value, though we are aware the completion of such a task must necessarily require the labor of many a long year.

The first artist to come into the new atmosphere was Kano Hogai; and Hashimoto Gaho followed in his wake. The latter studied old masters and developed a new style. From the Shijo school Kono Bairei and Kawabata Gyokusho rose, of whom the latter is trying to devise some novelties. Shibata Zeshin was an artist of rich originality, while Kishi Chikudo's *forte* was painting from nature. Noguchi Yukoku and Taki Kwatei were eminent artists of Southern school; Takemura Koun and Takuchi Kyuichi are noted for their original style in wood-carving, and Ishikawa Komei for his ivory work. European painting and plaster casting have made some progress. The architects have successfully introduced the European mode of house-building with bricks and stone, while they continue the proper Japanese style of building with wood.

BARON RYUICHI KUKI,
Privy Councillor and Custodian of the Imperial Art Treasures.

13. Japan—Finance and Coinage System. *Introduction.*—During the last 40 years since the Restoration, Japan has passed through many sudden and sweeping changes in her political and social affairs. Feudalism was abolished in favor of the centralization of government, to be succeeded by a representative form of government; the nation was engaged in civil wars and also passed through two foreign wars. In financial matters, too, the changes that occurred were both important and memorable. The adjustment of the land system and the reform of land taxation, the adjustment of hereditary salaries of Daimios (feudal lords) and Samurais by means of public loans, the unification of the business of the State Treasury, the reform of various taxes, the adjustment of paper currency and the adoption of the gold standard were among the most important of the changes. Of these this article will treat chiefly the adjustment of the paper currency, as it was the most important and difficult task of all.

How the Paper Money Came to be Issued.—The coinage system in vogue at the time of the Restoration (1868) was based on the system that was first established in the 6th year of Keicho (1600 A.D.), and continued to prevail

for upward of 260 years until the end of the Tokugawa régime. The Shogunate Government, however, frequently resorted to recoinage in order to relieve its growing financial difficulties, invariably making the coins lighter in quantity and poorer in quality. Some of the Daimios, too, took the liberty of secretly coining money, while, with the permission of the Government, some of them also issued paper money. The consequence of all these irregularities was that the currency system of Japan at the end of the Shogunate Government was in a most disorderly condition.

Soon after the Restoration, the Imperial Government resolved to reorganize the existing system of coinage on a sound basis, and in 1871 set itself to the task of reminting all the old coins. A gold standard was adopted, making one yen gold the standard unit. It consisted, after the American system, of 90 per cent. of pure gold, its weight being 25.72 grains. A one yen silver coin weighing 416 grains, 90 per cent. of which were silver, was also issued to be exclusively used at the treaty ports. In this way, although a gold standard was adopted, yet as a matter of fact it could not be operated in a satisfactory manner, owing to the over-issue of paper money and other circumstances then prevailing. Besides, as Mexican silver dollars were generally used as the medium of exchange in the trade of the Far East, it was found impossible to maintain the gold standard in Japan. Under the circumstances, in 1878 the Government allowed the use of the one yen silver piece as legal tender throughout the country, the circulation of which had formerly been confined to the limits of the treaty ports. The result was that the monetary system of Japan became bimetallic, and after the adjustment of inconvertible paper money it became a *de facto* silver standard.

Government Paper Money in the Early Years of Meiji.—In 1869 and the year following the Government was financially in a very difficult position. This was mainly due to the heavy expenses it had to meet in connection with the revolutionary wars, when there was scarcely any fixed source of revenue to rely upon. In order to relieve this financial distress, in 1868 the Government issued paper money called Kinsatsu (literally, gold notes). Then again, when in 1871 feudalism was abolished, the Government had to take over all the paper money, which had been issued by different Daimios. In order to adjust this class of paper money and owing to several other circumstances, the Government was obliged to issue further large amounts of paper money from time to time, until about the end of 1876 it totalled 93,000,000 yen.

The credit of these paper notes was at first exceedingly bad. In Tokyo and Osaka, the price of the new paper money was at one time more than 60 per cent. below the specie, while in other localities it could not be circulated. This was mainly due to the fact that the various kinds of paper money issued by different Daimios had already much depreciated in value, there having been even cases where they were disowned by the governments which had issued them. Moreover, the new Government was not as yet established on a firm footing, while the paper money was issued with neither the security for conversion nor within reasonable limit. It is not at all strange that the general public placed little confidence in the new paper currency.

In view of such a state of things, the Government endeavored to facilitate the circulation of the paper currency by every available means. Expostulations and threatenings were resorted to and then an order to pay taxes in the paper money was issued. It was even proclaimed that a person who would take premium in the exchange of paper with specie should be fined or imprisoned. Despite all these measures, the Government could not keep up the price of paper on par with specie. So in December 1868, the Government was obliged to make public recognition of the difference in price of paper and specie. This, however, only had the effect of still lowering the price of paper, and the Government withdrew the measure in April of the following year. In May of the same year, the Government shortened the period of circulation of the paper notes to five from the original 13 years, and pledged to regard them, if they remained in circulation after the expiration of that period, as Government bonds bearing 6 per cent. interest, besides announcing to the public the means of redemption and the amount of issue. These measures, however, were not satisfactorily carried out. But as the prestige of the new Government gradually came to be fully established, the credit of the paper money increased, and about 1872 the people even came to prefer it because of the convenience of handling. In fact its price became even higher than specie.

The Over-Issue of Paper Money Owing to the Rebellion of 1877.—Matters were progressing favorably, when in 1877 a rebellion broke out in the southwestern provinces of the Empire. In order to defray the expenses of this civil war, the Government was obliged to issue 27,000,000 yen of paper notes. Thus the amount of the paper money in circulation suddenly increased, until in January 1879 it reached the maximum amount of some 120,830,000 yen.

The Issue of Reserve Paper Money.—Although these paper notes were issued by the Government with the intention of withdrawing them after a fixed period, yet practically they became a sort of permanent debt; and besides them the Government provided itself with reserve paper notes, which were issued whenever it found itself in want of money, withdrawing them as soon as revenues were obtained. This extraordinary issue of reserve paper money gradually increased in amount, so that after 1878 the average yearly issue reached 20,000,000 yen.

The National Bank Notes.—Besides the kinds of inconvertible notes mentioned above, there was another kind of inconvertible paper, namely, the national bank notes. When in 1872 the Government pledged to redeem paper currency in five instead of 13 years as originally fixed, it adopted a scheme of establishing national banks with power to issue convertible notes, these notes to be issued on the strength of the Government bonds deposited in the Treasury Department. With this object in view the National Bank Regulations, modelled largely after the system then in vogue in the United States, were proclaimed. According to these regulations, a

national bank was to have a capital of at least 50,000 yen, and was first to bring to the Government paper money equal in amount to six-tenths of its capital, for which the Government was to deliver in exchange the same amount of the Kinsatsu-Exchange Bonds bearing 6 per cent. interest, and these the bank was again to take to the Government to be deposited as security for the same amount of the convertible bank notes to be delivered; four-tenths of the capital was to be in specie and kept as reserve for the conversion of these notes. The Government intended to retire all the Government paper money hitherto issued in exchange for these notes, but unfortunately that intention could not be carried out. For the specie was getting daily more scarce so that as soon as the convertible bank notes were issued, so much demand was made on the banks for exchange, that these notes never obtained any extensive circulation. Thus only four national banks were established, which issued some 2,000,000 yen of convertible notes between them. In 1876 the Government issued some 174,000,000 yen of the Hereditary Pension Bonds to take the place of the annual pensions of the Daimio and Samurai classes, hitherto paid in rice. Count Okuma, the then Minister of Finance, intended that these bonds should be made the capital of national banks and that those banks should be authorized to issue notes. In this way, it was believed that the Samurai would obtain a means of livelihood, while the economic market would be supplied with the much needed capital in the form of bank notes. With these ends in view, in August 1876, the Government made certain amendments in the National Bank Regulations, so that it now became possible to establish a national bank with power to issue notes without specie reserve at all. To be particular, the total amount of notes which the national banks might issue was limited to 34,000,000 yen; a bank might place as deposits in the Government Treasury any kind of Government bonds bearing interest at 4 per cent. and upward, to the amount equalling eight-tenths of its capital, in order to be able to issue bank notes equal to the amount of that deposit; at the same time the required conversion reserve for the notes issued was reduced to but two-tenths of the capital, and moreover this might be in any kind of currency. Thus the national bank notes were changed from being convertible in specie, into being convertible in currency; and since the currency of the time was inconvertible Government paper money, these bank notes, too, became another kind of inconvertible paper money.

The establishment of national banks having thus become quite easy, many were soon established, and in April 1880 the notes issued by them reached the maximum amount of 34,420,000 yen.

In these ways, the amount of inconvertible paper money in circulation rose step by step, until it reached its highest point in January 1880, as may be seen from the figures given below:

	Yen
Government paper money	113,831,709
Reserve paper money temporarily issued	22,188,116
National bank notes	34,137,652
	170,157,477

The Policy of the Government Towards Inconvertible Paper Money About 1879.—One result of such over-issue of inconvertible paper money was the difference in price of silver and paper, which began to manifest itself at the beginning of 1877. At the close of that year the ratio between silver and paper became as much as more than 1 yen and 21 sen of paper to 1 yen of silver. The general public began to pay attention to the disposal of the paper money. The Government, too, recognized the necessity of taking measures to redeem the Government bonds and paper money, and in August 1877 drew up a plan aimed at the redemption of the paper money within seven years, publishing it in July of the following year.

An opinion, however, prevailed both among the authorities and the general public that the differences in the value of paper and silver were due not to the depreciation of paper, but to the appreciation of silver, and the Government made efforts to prevent the rise of the price of silver rather than to redeem the paper money. Thus, when in March 1879, the difference between silver and paper became 1 yen and 26 sen of paper to 1 yen of silver, the Government induced the First, Second, Mitsui and Specie banks to sell out silver coin. The measure was unsuccessful in so far as it temporarily checked the rise of the price of silver, but no sooner was the sale of silver coin suspended than the paper money further depreciated. As it was, the Government abandoned the measure in September 1880.

The Government also opened a place for transacting the exchange of Mexican dollars at Yokohama with the purpose of facilitating the sale and purchase of silver and of preventing thereby the rise of the price of silver. Further in February 1880, the Government established the Yokohama Specie Bank, contributing one-third of its capital, with the object of inviting people to invest hoarded coins, so that these coins might be supplied to the financial market. The Specie Bank was, moreover, to engage in foreign exchange in order to facilitate monetary circulation between Japan and foreign countries.

All these measures, taken with the object of checking the rise of the price of silver, having failed, the Government ultimately resolved to set itself to the task of redeeming paper money in earnest. In September 1880, the Government doubled the rate of tax on Saké, so that the increased revenue to the amount of 5,000,000 yen a year might be set apart as a redemption fund. Again, the Government extended the spheres of local taxation, correspondingly lightening the burden of the Central Government, and at the same time the Government expenditures were much curtailed, the surplus obtained in all these ways being also added to the redemption fund. Besides all these, the Government decided gradually to transfer by sale to private hands the Government factories, which had been established for the encouragement of industry; stopped making loans to companies and individuals out of the reserve fund in the Treasury; and every yen thus gained went to further increase the amount of the redemption fund.

Yet the depreciation of paper did not stop. In April 1881, 1 yen silver brought on an

average 1 yen 80 sen of paper, this being the lowest point ever reached in the depreciation of paper money.

The Effects of the Over-Issue of Inconvertible Paper Money on the Finance of Japan.—The following tables show some of the effects produced on the finance of Japan by the over-issue of inconvertible paper money between 1868 and 1881.

TABLE I.—SHOWING AVERAGE YEARLY EXCHANGE RATE OF PAPER MONEY FOR SILVER YEN FROM 1871 TO 1881.

Years.	For one silver yen, yen

1880	18.00	9.00	13.11
1881	18.00	7.20	14.03

As may be seen from the above tables, before 1877, the over-issue of inconvertible notes resulted only in the excess of imports over exports and the efflux of specie from the country, but after that year, as the amount of inconvertible notes issued suddenly increased, not only a great depreciation of paper and a faster and greater efflux of specie followed, but prices rose with abnormal rapidity. This was especially the case with the price of rice, which rose by 98 per cent. in 1880 and 1881 compared with that in 1877. The rate of interest also rose by more than 4 per cent. on an average in those days, it being possible to buy Government bonds bearing 7 per cent. interest at a price more than 30 yen lower than their face value. The bad effect of such a state of things was felt in various directions. The revenue of the Government was practically reduced to one-half in value of what it had been, and the people who lived on fixed incomes suffered greatly owing to the sudden and considerable depreciation of their incomes. The rise of the price of rice swelled the incomes of farmers, who constituted

a great majority of the inhabitants of the Empire, with the result that they contracted habits of luxury. The imports exceeded the exports more and more and gold and silver left the country in ever increasing quantity. As for the industrial and mercantile classes, they were simply bewildered at the sudden and frequent fluctuations of prices and instead of engaging in honest business, hoped and struggled to reap profit by speculation. In fact the financial market of those days was apparently in a very prosperous condition, but it was actually on the brink of ruin. This may be judged from the fact that whereas the export trade of the country increased by 62 per cent. in the five years between 1872 and 1876, it increased by only 28 per cent. in the same length of time between 1877 and 1881.

The Adjustment of the Inconvertible Paper Currency.—In the autumn of 1881, a great split took place in the government, and as a result the present writer was transferred from the chair of the Minister of Home Affairs to that of the Minister of Finance. It was just the time when the depreciation of the paper money reached its lowest point and both the Government and people were in a most uneasy mood. It was found that the amount of the Government paper and of the bank notes in circulation at that time stood as follows:

	Yen
Government paper money	105,905,211
Government paper money temporarily issued out of the Paper Money Reserve	14,500,000
Notes issued by National Banks	34,398,030
Total	154,803,242

All these were inconvertible paper money. The Government decided that unless some drastic measures be taken to dispose of them, the state finance would soon come to ruin. It became clear in the eyes of the financial authorities that to accomplish the adjustment of the inconvertible paper money, there was no other way than that side by side with the redemption of a portion of the paper money in circulation steps be taken to increase the specie reserve of the Government preparatory to the resumption of specie payment. It was at first intended to adjust and redeem all the inconvertible notes issued by the Government and national banks once for all, and establish a central bank having the sole privilege of issuing convertible notes. With that intention, investigations were made into the actual financial condition of the Government. It was found that 7,000,000 yen could be annually appropriated from the ordinary revenue of the Government towards the redemption of paper money, and that there was a reserve fund amounting to about 55,000,000 yen. Of this sum about 19,000,000 yen had been loaned out, so that the amount at hand was but 36,000,000 yen. But as about 25,000,000 yen out of this consisted of bonds, and 2,000,000 yen of bank shares and paper money, the amount of specie was no more than 8,000,000 yen. Further, even this amount existed in the account book only, for out of this, 3,000,000 yen were loaned out to certain foreigners, so that the amount of specie actually available for conversion was only about 5,000,000 yen. Nevertheless it was firmly believed that by utilizing the balance of revenue above referred to, and also by employing this specie reserve to advantage, the Government should be able to carry out its scheme of redeeming paper money in about five years.

In some quarters it was opined that it was unwise to accumulate and store specie, because specie would of itself naturally flow in if the paper money should be withdrawn and the currency decreased. Anticipating, however, the great difficulty that would attend the realization of the scheme of convertible notes, the Government adhered to the policy of accumulating and storing as much specie as possible.

The task of doing this, however, was not an easy one. The amount of the specie that remained in the country on those days was extremely small, while the yearly output of gold and silver mines in the country was less than 400,000 yen. Moreover, bound up by the treaty, the Government could not revise tariff to its advantage. On the other hand in view of the financial condition of the time, the country would suffer great disadvantage if foreign loans were resorted to. Under these circumstances the Government came to the conclusion that the only way open was to try to bring in gold and silver from abroad by means of discounting foreign bills of exchange accompanied by securities, and accordingly this scheme was adopted though there was no little opposition within the Government itself.

It indeed required a great determination on the part of the Government to accomplish the adjustment of the paper currency; for it was apparent with the rise in the value of paper money the prices would fall, leading to the disappearance of the seeming prosperity of the country which then prevailed. Loud voices would naturally be raised against this policy from all quarters. To make it sure that no opposition would ever stop the carrying out of the Government's scheme, the Emperor's special sanction for this scheme was obtained.

Previous to this, about 1880, a plan to raise a foreign loan of 50,000,000 yen for the purpose of redeeming paper money was advocated by some in the Government, but the plan was never adopted. Subsequently a certain influential foreigner suggested the establishment of a bank under foreign management, with a joint domestic and foreign capital, and with a privilege to issue debentures with premium coupons, both at home and abroad, the idea being to devote the profit obtainable in that way to the redemption of the paper money. This suggestion found favor at first with the Government but was finally rejected.

The Adjustment of the Reserve Paper Money.—The first task was the adjustment of the reserve paper money. As before stated, the reserve paper money was issued for temporarily meeting the deficit of revenue. It was thus not of a permanent nature, but all the same it had the evil result of increasing the amount of circulation of inconvertible notes.

In order to withdraw from circulation the amount thus utilized from the paper money re-

serve, certain changes were made in the method of making receipts and disbursements of the public revenue, as well as in the method of disbursing the expenditures of the Government Departments, so that thenceforth these disbursements were all made at the exchequer, instead of having the amounts of the estimated expenditures turned over in lump sums to the departmental authorities in the early part of the fiscal year, as had been done before. These changes were effectual in giving the Treasury available funds. Yet further steps were taken toward the increase of the Government reserve by withdrawing the loans made out of the Government reserve (in aid of industrial enterprises) and by selling the government bonds which were held by the Reserve Fund. The increased specie in the Reserve obtained in this way was temporarily utilized as well as all the available funds in the Treasury for the withdrawal from circulation of the Reserve paper money, the task being accomplished in January 1883. After this, whenever the Government was temporarily in need of funds, they issued short-term public loans in the form of the Treasury bills. The Treasury Bills Regulations were issued in September 1884.

Economy in the State Expenditure and the Redemption of Paper Money.—The adjustment of the troubles connected with the temporary issue from the Paper Money Reserve was comparatively easy. But with regard to the adjustment of the troubles which existed in connection with the paper currency proper, the task was very much greater.

At was stated above, in October 1881, when the writer was appointed Minister of Finance, it was found that about 7,000,000 yen could be appropriated annually out of the ordinary revenue for the redemption of paper money. In order that this surplus should not be spent for any other object, the Government decided that the state expenditures should not be further increased for the three years after the year 1882.

During the period just mentioned, however, the Government had to defray considerable extraordinary expenditures owing to the outbreak of cholera throughout the country, the occurrence of troubles with Korea and the consequent expansion of armament, and some other affairs. Besides, after 1882 on account of the general dullness of trade, the Government revenue markedly decreased. For instance, in 1883 the revenue decreased by as much as 2,000,000 yen in saké tax alone. Thus having found it impossible to carry out the prearranged plan, the Government took measures to increase its revenue by means of new taxes. Thus in 1882 the Government first levied stamp duties on patent medicines, and license tax on the brokers of the rice-exchange and the stock-exchange, and revised saké and tobacco taxes; and in 1885, taxes on soy and confectionary were levied for the first time. Part of the surplus of the revenue which was secured through these means was devoted to the redemption of the paper money, while the remainder was added to the reserve fund with the object of employing it for securing the importation of specie from abroad. The amount employed in these ways for the adjustment of the paper money during the five years from 1881 to 1885 was as follows:

	Yen
The amount directly employed in the redemption of the paper money.....	13,640,000
The amount added to the reserve fund....	26,466,828
Total.....	40,106,828

The direct redemption of the paper money with part of the surplus of the revenue was made only till 1883. It was abandoned after 1884, as the difference of paper and silver in price disappeared, and all the surplus of the revenue was added to the reserve fund.

The Discounting Operations of Foreign Bills of Exchange and the Accumulation of Reserve Specie.—The reserve fund so frequently referred to above originated in the Government's learning, through the trying financial experience of the first years following the Restoration, the importance of creating a fund during normal times, and also because there was the need of such a fund to enable the Government to resume specie payment. The fund was commenced and efforts were made to augment it by investment. In 1878, 20,000,000 yen were set aside as the Sinking Fund, out of the Reserve Fund, with the purpose of investing the amount in Government bonds in order to apply the interest accruing therefrom to paying off the principal and interest of the public debt. In 1881 the total amount of the Reserve Fund possessed by the Government was more than 55,000,000 yen, the Reserve Fund proper and the Sinking Fund being counted together. In August 1882, the Government decided to purchase specie with the Government bonds constituting the sinking fund, and since then the sinking fund existed in name only. As the amount of specie in the Reserve Fund which was possessed by the Government in 1882 was only about 5,000,000 yen, the attempt was now made to increase it with the specie obtained by discounting foreign bills of exchange.

It was in 1880 that the Government first engaged in transactions connected with foreign bills of exchange by establishing the Yokohama Specie Bank and entrusting to it the sum of 3,000,000 yen in order that it might discount foreign bills of exchange on the security of exported goods, at the request of mercantile companies engaged in the direct export trade. The main object of thus engaging in discounting foreign bills of exchange was to encourage, on the one hand, the direct export trade, and on the other to secure specie—it being the object of the Government to use the specie thus obtained in paying off its foreign expenses. In those early days, however, the business connected with the foreign bills of exchange being entirely new, and the whole thing being mismanaged, there arose various evils connected with it, so that the result was far from accomplishing the object sought. The Government thus not only failed to accomplish the absorption of specie, but had even to sustain losses, owing to the fact that the advances made often remained unpaid long after the expiration of the term of maturity. The causes of this failure on the part of the Government, in its first experience connected with foreign bills of exchange, appear to have been: 1. The laxity in the inspection of goods before discounting the bills of exchange, so that

goods of inferior quality were sent abroad which did not command the expected price. 2. The business connected with the disposal of exported goods being mismanaged, led to uncertainties and irregularities in their sales, causing delay in the payment of the bills. 3. Since the money advanced in discounting the foreign bills of exchange was in paper money, it was arranged that the collection of those bills abroad should also take place in terms of paper money; so that the price realized abroad on the goods exported was, in paying for these bills, converted into the terms of paper money according to the rate of exchange prevailing at the time. And this process took place at a time when the paper currency was rapidly depreciating. As a result, the export merchants became engrossed in the subjects of fluctuations in the value of paper money—regarding their business as one of speculation rather than of sober legitimate transaction, in the hope of realizing certain chance profits from the fluctuation of paper money.

Accordingly the system of discounting foreign bills of exchange was revised so as to do away with the above-mentioned evils and the revised system was put into operation after March 1882. The following were the chief points of revision: 1. The Specie Bank to make a very strict examination of the goods on whose security the bills were discounted. 2. The Japanese Consulate at the place whither the goods were sent to be entrusted with their supervision, so that they were not to be delivered until after the payments were made for the bills of exchange. 3. The bills to be made payable in foreign currency at the rate previously determined in accordance with the rate of foreign exchange ruling on the day of discounting them.

Since these revisions were introduced into the system of discounting foreign bills of exchange export merchants gave up any idea of speculation and ceased to cause losses to the Government. Further, in June 1884, the privilege of having the bills discounted was extended to foreigners also. The result was very satisfactory, the amount of specie acquired in foreign countries having markedly increased after September of that year. The Government was thus enabled to increase the specie reserve, which was no more than 8,000,000 yen in 1881, to more than 42,000,000 yen at the end of 1885.

Establishment of the Bank of Japan.—Simultaneously with commencing the accumulation of reserve specie, the Government felt that in order to effect the adjustment of the paper money, it would be necessary to establish a great Central Bank. As before said, the national banks in Japan were patterned after the American system. As a matter of fact there were in 1883 over 260 banks, with their branches throughout the country, which issued paper money to the amount of 34,000,000 yen. But the capital they had at their disposal was generally of small amount. Besides they were established in circumscribed localities, each one within a narrow circle of influence. For this reason the communication between different banks was exceedingly bad, so much so that should there be surplus capital in one bank, and another bank be in dire need, yet the former could not help the latter. In order to remedy such a state of affairs, it was thought that there was no better way than establishing a great Central Bank, as in western countries. It was believed that such a bank would do much to regulate the monetary circulation of the country, simplify the business of the Exchequer, smooth the transactions of foreign bills of exchange and regulate the influx and efflux of specie and bullion. Besides, it was believed that to invest it with the sole privilege of issuing convertible notes was of utmost importance to the adjustment and unification of paper money.

After studying the systems regarding such Central Banks in vogue in different European countries, the Government came to the conclusion that the Belgic system would best serve as a model, and after its pattern a plan was drawn up for the establishment of a Central Bank, called the Bank of Japan, and the main features to be as follows: 1. That the Bank of Japan would be able to facilitate the circulation of currency throughout the country, as it would be in a position to look upon other banks somewhat as its branch offices and open correspondence with them. 2. That the Bank of Japan would be able to increase the strength of national banks as well as of trading or manufacturing companies by means of re-discounting their bills. 3. That the Bank of Japan would be able to lower the current rate of interest, as it would chiefly engage in the business of discounting short-period bills and thereby would facilitate the circulation of capital. 4. That when the business organization of the Bank of Japan was completed, it would be possible to simplify the business of the Government by entrusting to the bank a part of the business of the Finance Department, such as the receipt and disbursement of Government money and the liquidation of the public debt. 5. That the Bank of Japan might be made an organ of importing and preserving specie by making discounting foreign bills of exchange one of its functions.

The Regulations concerning the Bank of Japan were promulgated in June 1882, and in October of the same year the bank was founded. The main points in these regulations were as follows: 1. The term of business of the bank to be 30 years. 2. The capital to be 10,000,000 yen. 3. One-fifth part of the capital to be paid in before the bank opened business and the remainder payable in installments as the bank might require according to its business needs. 4. A limit to be placed on the kind of business the bank may engage in; the risky and dangerous kinds of business to be prohibited. 5. The bank to be entrusted with the receipt and disbursement of Government money, so far as it was convenient to the Government. 6. While the issuing of convertible bank notes should be considered its rightful privilege, that privilege to be withheld for some time to come. 7. The Governor and Vice-Governor of the bank to be appointed by the Government, the former to be of Chokunin rank and the latter of Sonin rank. 8. The Minister of Finance to appoint comptrollers to act as his representatives. 9. The directors and auditors to be elected by the 13 bank's shareholders. 10. The bank to make the monthly report of its business conditions to the Minister of Finance. 11. The Government to become the bank's shareholder to the amount of one-half the entire capital of the bank.

It goes without saying that such a Central Bank should possess the sole privilege of issuing convertible bank notes. But in those days Japan did not possess an adequate specie reserve and the difference of paper and silver in value was exceedingly great. For these reasons the Government withheld from the bank the privilege of issuing convertible notes for some time. In return, with the view of making the establishment of the bank easy, the Government undertook to take one-half of the entire capital of the bank and also permitted the bank to give 2 per cent. more dividends to private shareholders than the Government received. In spite of such favorable conditions, the task of inducing the people to invest their money in the bank's shares was not an easy one.

Disposal of the National Banks.—Having thus succeeded in gaining the first step in the direction of the adjustment of paper money—namely, the establishment of a Central Bank, the Government now faced the task of disposing of national bank notes.

Since the national banks had been chartered for 20 years, and that term had not expired, they could not be abolished at once. On the other hand, however, should they be left as they were and abolished at the expiration of the term there was a fear that not only these banks but the country would greatly suffer.

In view of these circumstances the plan adopted by the Government was as follows: 1. After the expiration of the term of 20 years each national bank be permitted to continue business, if it so desired, as a private institution. 2. Each bank to deposit with the Bank of Japan a reserve fund for the redemption of notes, money equal in amount to one-fourth the amount of notes issued by that bank and also make a deposit in the same way of a portion of its profit every half year, the amount to equal 2.5 per cent. per annum of the amount of the notes issued by it. The Bank of Japan to buy Government bonds with that fund in order to spend the interest accruing therefrom for the redemption of notes. If after the expiration of the term of the bank, there yet remain notes unredeemed, that fund be employed for the redemption of such remaining portion of the notes. 3. The Bank of Japan to transact the business of redeeming national bank notes according to the above method and to exchange national bank notes with currency any time the demand is made.

In May 1883, the National Bank Regulations were properly amended and the disposal of the national bank notes was immediately commenced. As described, the accumulation of specie was begun simultaneously with the redemption of the Government paper money and the Government set itself to the task of disposing of the national bank notes as soon as the establishment of a central bank was accomplished. Thus the time for carrying out the conversion of paper money now approached. Now, as after 1876, the national bank notes also became inconvertible, the total amount of the Government paper money and bank notes in circulation between that year and 1885 is shown in the following table in comparison with the specie reserve of the Treasury:

TABLE VII.—SHOWING AMOUNT OF GOVERNMENT PAPER MONEY AND BANK NOTES IN CIRCULATION AND OF THE SPECIE RESERVE FROM 1876 TO 1885.

On the last day of the year	Amount of government paper money and bank notes, yen	Amount of the reserve specie, yen	Percentage of the reserve specie to the amount of paper money in circulation
1876..	106,891,582.7625	15,171,224.366	14.2
1877..	119,149,843.3345	15,115,405.677	12.7
1878..	165,697,598.0570	17,837,729.269	10.8
1879..	164,354,935.3550	9,967,879.919	6.1
1880..	159,366,836.8550	7,166,819.462	4.5
1881..	153,302,012.9820	12,699,576.269	8.3
1882..	143,754,363.2320	16,730,267.809	11.6
1883..	132,275,012.9320	25,876,230.373	19.6
1884..	124,396,175.6320	33,569,188.107	27.0
1885..	118,500,485.2320	42,265,640.540	35.7

As is shown in the above table, the amount of the reserve specie at the end of 1885 was more than 42,000,000 yen. Of this amount more than 13,000,000 yen were in gold. When this amount was estimated at the current price of silver at that time, the total amount of the reserve specie increased from over 42,000,000 yen to 45,000,000 yen. In consequence, the percentage of the reserve specie was in reality 59 to the amount of the Government paper money in circulation, and 37.9 to the aggregate amount of the Government paper money and bank notes.

A great difficulty was experienced in accumulating specie on account of the disadvantageous position in which the country found itself with regard to the treaty with foreign countries. By that treaty Japan was entirely circumscribed in the exercise of the power to revise its tariff system, being unable to impose any customs duty on imported foreign articles other than the 5 per cent. duty fixed in the treaty. If Japan had been at liberty to increase its customs duty, the Government might have increased its revenue and obtained a source of accumulating specie. Besides, it would have made the trade relation with foreign countries advantageous to Japan and given facilities for attracting specie from foreign countries. As, however, Japan was unable to do all these things, a great difficulty was experienced in attracting specie from foreign countries, as in so doing Japan had only to rely upon the means of discounting foreign bills of exchange.

As the amount of paper money in circulation decreased and that of the reserve specie increased, the difference of paper and silver in price gradually became less, until at the end of 1885 it almost disappeared.

The following table shows the average exchange rate of paper money for gold and silver yen from 1882 to 1885:

TABLE VIII.—SHOWING AVERAGE YEARLY EXCHANGE RATE OF PAPER MONEY FOR GOLD AND SILVER FROM 1882 TO 1885.

YEARS	For one gold yen, yen	For one silver yen, yen
1882.....	1.690	1.571
1883.....	1.394	1.264
1884.....	1.198	1.089
1885.....	1.218	1.055

The gradual disappearance of the difference in price of paper money and silver brought about various effects upon the financial condition of Japan. The following tables give statistics concerning them:

TABLE IX.—SHOWING THE EXPORTS AND IMPORTS OF COMMODITIES FROM 1882 TO 1885.

Years	Exports, yen	Imports, yen	Excess of Exports, yen
1882.....	37,721,751	29,446,594	8,275,157

1884.....	15.00	9.30	10.91
1885.....	16.50	10.00	11.38

The effects of the gradual disappearance of the difference in price of paper money and silver on the financial condition of the country may be clearly seen by comparing the above tables with those relating to the financial condition before 1881, previously given. As may be seen, prices gradually fell to their normal standard. The fall of price of rice was especially noticeable. In 1884 it fell to nearly one-half of what it was in 1881. Interest also fell to its normal rate of about 10 per cent., which ruled before the over-issue of inconvertible notes, while Government bonds were quoted at a price approximate to their face value. But closely following on the heels of these results there came a severe depression of trade and industry which culminated in 1883 and 1884. The fall of the price of rice told most heavily upon farmers, who had contracted habits of luxury during the years of its high quotation, for practically their incomes now fell off by nearly one-half, while their burden in the shape of land-tax was doubled. Loud voices of complaint against the Government's financial policy resounded throughout the country, and the authorities had great difficulty in satisfying local officials, who sympathized with the farmers and came up to the metropolis one after another to lay their complaint before the Central Government. Convinced that the redemption of paper money was of utmost importance to the State finance, the Government was deaf against all complaints and resolutely pursued its policy.

Facts Connected with the Conversion of Paper Money.—By 1884 it was satisfactory to find that the amount of paper money in circulation was much reduced, while the Government's reserve fund in specie considerably increased. In view of these facts, the price of paper money gradually kept rising until it stood on a par with silver. Now came the opportunity to carry out the convertible note system, and the Government decided to permit the Bank of Japan to issue a certain amount of convertible bank notes as a sort of experiment, preparatory to the resumption of specie payments. The Convertible Bank Note Regulations were promulgated in May 1884, and the Bank of Japan issued convertible notes for the first time in May of the following year, the amount reaching 3,000,000 yen at the end of that year.

Every preparation for the resumption of specie paying having been made, the Government began in January 1888 to pay specie for the Government paper money, entrusting the business with the Bank of Japan.

Although the Government commenced specie payment for the Government paper money, the people rarely made the demand to have the exchange made. The reason was that the difference between paper and silver in value had already disappeared, and people generally preferred paper because of the convenience of handling.

As a result of the gradual redemption of both Government paper money and National Bank notes, it was found on the last day of June 1888, that the amount of the former had been reduced by more than 49,000,000 yen and that of the latter by 28,000,000 yen. The opportunity arrived to finally dispose of them all and place the currency system of the country on a sound basis. The Government therefore decided to permit the Bank of Japan to issue convertible notes to the amount of 70,000,000 yen on the

security of a conversion reserve, of which sum 21,000,000 yen was to be issued by the Bank at its own will, 22,000,000 yen was to be supplied to the Government as a loan at interest of 2 per cent. for redemption of the Government paper money, and the remaining 27,000,000 yen was to be issued by the Bank after January 1889, gradually in proportion as the National Bank notes would be redeemed. In view of this plan, the Convertible Bank Notes Regulations were amended in August 1889. The Government, however, did not find it necessary to make the above-mentioned loan.

In March 1890, the Government adopted a plan of setting apart as a redemption reserve the sum of 10,000,000 yen, out of the reserve fund, in order to accomplish the entire withdrawal of the Government paper money. In May of the same year the legal amount of notes to be issued on the security of the Reserve by the Bank of Japan was enlarged to 85,000,000 yen, while at the same time it was provided that the Bank should loan the Government 22,000,000 yen without interest. The Regulations were duly amended to suit these changes, and in July of the same year the Government secured the above mentioned loan and added the amount to the Redemption Fund.

In these ways, both the Government paper money and the National Bank notes were finally all withdrawn and the unification of the paper currency, by means of the Bank of Japan convertible notes, was accomplished. The amount of the Government paper money which was redeemed from January 1886 to the end of March 1890 was more than 48,000,000 yen. Of this amount, 43,346,716 yen were exchanged with silver coins and 4,933,124 yen were redeemed by Government bonds and other means.*

The amount of the bank notes which were redeemed in the same period was more than 3,700,000 yen. The following table gives the particulars:

	Yen
Amount redeemed by the Bank of Japan by means of the joint redemption method....	3,730,451
Withdrawn from circulation on account of fraudulent alterations or winding up of business.....	33,561
Total	3,764,012

The following table shows the amount of the paper money in circulation from January 1886 to March 1890:

end of March 1890, 32,000,000 consisted of denominations above 1 yen. These were to be redeemed with the redemption fund as already narrated, while 8,000,000, which consisted of denominations below 50 sen, were to be redeemed gradually by funds which were to be set aside from the general revenue of the Government. These schemes of redemption were carried out without a hitch, and in 1898 the law was promulgated announcing that the Government paper money should cease to circulate after the 31 Dec. 1899.

With regard to the redemption of the national bank notes, it steadily progressed by means of the joint redemption method before mentioned, and in 1896 it was announced that they should also cease to circulate on 31 Dec. 1899.

To briefly sum up. In October 1881 there were in circulation more than 154,000,000 yen of inconvertible paper money. It was redeemed in the following ways: 1. The reserve paper money, 14,500,000 yen. This amount was entirely redeemed by the end of 1883 by means of the surplus funds obtained through effecting reform in the method of making receipts and disbursements of the public revenue and also by other means. 2. The Government paper money, 105,905,212 yen. Of this amount, 65,839,956 yen were redeemed by the end of March 1890, 13,640,000 yen by the surplus revenue, 43,346,716 yen with specie and 8,853,240 yen by Government bonds and other means. The remaining amount of 40,065,256 yen was gradually redeemed with 10,000,000 yen, the balance of the Reserve Fund, and 22,000,000 yen loaned from the Bank of Japan. The amount of 8,065,256 yen, which still remained unredeemed, was exchanged with silver coins of denominations below 50 sen out of the general revenue, as it consisted of paper money of smaller denominations. In these ways, the whole amount was adjusted within five years after 1899, at the end of which the circulation of the paper money ceased. 3. The national bank notes, 34,398,030 yen. Of this amount 3,764,013 yen were redeemed by the end of

TABLE XIV.—SHOWING THE TOTAL AMOUNT OF THE PAPER MONEY IN CIRCULATION FROM 1886 TO 1890.

Years	Government paper money, yen	National bank notes, yen	Convertible bank notes, yen	Total, yen
Jan. 1, 1886.....	88,345,096.232	30,155,389.000	3,653,272.000	122,153,757.000
Dec. 31, 1886.....	67,800,846.332	29,501,484.500	39,025,779.000	136,328,109.832
Dec. 31, 1887.....	55,815,044.832	28,604,137.500	53,235,102.000	137,654,280.332
Dec. 31, 1888.....	46,734,740.582	27,679,656.500	62,995,518.000	137,409,915.082
Dec. 31, 1889.....	40,913,034.582	26,739,205.500	74,297,005.000	141,949,245.082
March 31, 1890.....	40,065,255.900	26,391,376.500	77,615,442.000	144,072,074.400

Of these 40,000,000 yen of the Government paper money, which were in circulation at the March 1890 by means of the joint redemption method and other means. The remaining amount of 32,634,017 yen was also redeemed by means of the joint redemption method within five years after 1899.

Thus all the inconvertible paper money in Japan was adjusted, and to-day only specie and

*Of more than 43,000,000 yen, which were exchanged with silver and coins, the amount exchanged by demands from private people and banks was only some 8,900,000 yen. The rest of the paper money exchanged was received and exchanged with silver coins either by the Bank of Japan or by the government.

the convertible notes issued by the Bank of Japan are in circulation.

The Effects of the Adjustment of Paper Money on the Finance of Japan.—What effect the adjustment of the inconvertible paper money had on the finance of Japan may be seen from the following figures relating to the finance of the country from 1886 to 1890, the tables being a continuation of those already given.

TABLE XV.—SHOWING THE EXPORTS AND IMPORTS OF COMMODITIES FROM 1886 TO 1890.

Years	Exports, yen	Imports, yen	Excess of exports, yen	Excess of imports, yen
1886	48,876,313	32,168,432	16,707,881	.....
1887	52,407,681	44,304,252	8,103,429	.....
1888	65,705,510	65,455,234	250,276	.....
1889	70,060,706	66,103,767	2,956,939	.....
1890	56,603,506	81,728,581	.....	25,125,075

N.B.—The greatly increased import for the year 1890 is due to the increased import of rice, on account of the bad rice crop in that year.

TABLE XVI.—SHOWING THE IMPORTS AND EXPORTS OF SPECIE FROM 1886 TO 1890.

Years	Export, yen	Import, yen	Excess of export, yen,	Excess of import, yen
1886	9,626,447	9,171,873	454,574	.....
1887	11,035,488	8,871,266	2,164,222	.....
1888	7,833,444	8,732,491	.....	899,047
1889	5,188,530	14,173,246	.....	8,984,716
1890	13,778,532	1,200,607	12,577,925	.....

TABLE XVII.—SHOWING PRICES FROM 1886 TO 1890.

Years	Unhk'd rice (mid. grade), per 1 koku, yen	Salt (takao), per 10 hiyo, yen	Tea (green, middle grade), per 1 kwan, yen	Copper, per 100 catty, yen	Iron (Japanese produce), per 1 picul, yen	Cotton (1st grade), per 1 kwan, yen
1886	5.990	2.817	1.550	17.550	2.500	1.269
1887	4.940	2.625	1.500	15.840	3.438	1.256
1888	5.025	2.398	1.500	25.050	4.187	1.406
1889	5.990	4.348	1.420	20.400	3.938	1.532
1890	8.940	3.774	1.500	18.350	3.750	1.416

TABLE XVIII.—SHOWING THE PRICES OF GOVERNMENT BONDS FROM 1886 TO 1890.

Years	7 per cent. interest bearing kinroku bonds, yen	5 per cent. interest bearing adjustment bonds, yen
1886	107.349	.....
1887	105.088	101.578
1888	104.306	101.445
1889	103.922	101.017
1890	103.428	99.236

TABLE XIX.—SHOWING THE RATE OF INTEREST FROM 1886 TO 1890.

Years	Highest per cent.	Lowest per cent.	Average per cent.
1886	10.50	7.20	9.16
1887	11.00	7.13	8.73
1888	12.00	8.00	9.66
1889	12.00	8.00	10.17
1890	12.15	10.20	11.18

As will be seen from the above tables, prices fell to their normal standard and no fluctuations took place; the rate of interest became less than 10 per cent. on an average since 1886; the Government bonds were always quoted above their face-value; while the export trade of the country steadily increased, so much so that compared with that of 1886, 1889 showed an increase of 63 per cent. and compared with that of 1885 an increase of 88 per cent. As for the banking and different industries they also became very prosperous, as may be seen from table XX.

From the table below it will be seen that within five years the aggregate capital of banks and different industrial and mercantile companies increased two and a half times, and, if the banks be excluded, by four times. It may be mentioned that the railway and spinning business made the most advance in the course of those five years.

TABLE XX.—SHOWING THE AMOUNT OF CAPITAL INVESTED IN DIFFERENT BUSINESS COMPANIES FROM 1886 TO 1890.

Years	Banks, yen	Railway, yen	Transportation, yen	Trade and industry, yen	Agriculture, yen	Total, yen
1886	70,375,125	12,119,500	12,653,670	24,660,639	1,052,923	120,861,857
1887	79,234,912	13,069,500	12,612,284	39,249,582	2,924,102	147,090,380
1888	78,139,248	41,020,000	10,246,499	60,441,546	5,961,936	195,809,229
1889	79,653,549	50,040,000	19,819,309	105,637,176	8,118,592	263,268,626
1890	82,121,278	55,070,000	24,689,846	113,616,312	8,229,982	283,727,418

To conclude, the adjustment of inconvertible paper money in Japan was accomplished by adopting a *de facto* silver standard. This was unavoidable owing to the special economic conditions of the country as well as of the commercial relations with the neighboring nations. But it was no more than one great step in advance. When in 1897 the gold standard system was adopted, the country at last came under conditions corresponding to the general tendency prevailing in the world, and thus was finally established Japan's coinage system on a secure basis.* COUNT MASAYOSHI MATSUKATA.

*See Count Matsukata's published report on the Adoption of Gold Standard in Japan.

14. Japan—Agriculture. *1. History.*—The ancestors of the modern Japanese seem not to have been eaters of meat and milk, and butter and cheese were unknown to them. These facts, together with the mountainous character of the country, fully justify the supposition of the non-existence of any nomadic tribe. It is very probable that from the earliest time the Japanese understood how to till the soil, whose only crop, however, with the possible exception of hemp, was rice. European authors seem to think that the Japanese started agriculture after the Chinese pattern, but there is reason to believe that the cultivation of rice was introduced from India. Rice in those days was probably sown in marshy places, year after year in succession, without fallowing and without manure. But it was soon found that marshes were not sufficient. As the agricultural lands gradually extended, the first great effort of the government to foster agriculture was in making arrangements for irrigation. When we consider that low tracts of land only were devoted to rice culture, where rain water and irrigation were productive of large quantities of rich soil, we can understand why successive crops of rice have been exhausted the soil's fertility. Moreover, as nitrification does not occur in wet soils, nitrogenous compounds were little wasted.

Breaking up land for rice was much encouraged, which led to the proprietorship of land at a very early period. But lack of knowledge and capital only permitted the irrigation of low tracts of land, and the resources of paddy fields were soon exhausted. Then it became necessary to till the fields and the cultivation of barley was gradually introduced, but we cannot fix the exact time. Indian millets, soybean, and other crops were also introduced and their cultivation encouraged. Indeed we find in very early literature the name of «gokoku» (the five grains), which signified rice, barley, soybean, awa and hive, the latter two being kinds of Indian millets, or rice, barley, awa, soybean, and adzuki (Phaseolus radiatus).

It is very probable that silkworm raising began at a much earlier date than is generally believed, but the silk industry was not greatly encouraged until after the eggs of Chinese silkworms were introduced in 195 A. D. Thereafter silkworm raising continued to occupy an important place in farming, until it fell into decline on account of the civil wars, its revival taking place only after the Mikado was restored to power in 1871.

Whether or not any livestock, such as cattle and horses, existed in the remotest antiquity is much disputed, but if so they were certainly not much used. At first even cattle were used solely as beasts of burden, for which purpose, on account of the mountainous character of the country, and the narrow and rugged roads, they were better suited than horses. They were often slaughtered, not for meat but for their hide. The use of milk as food was unknown. It was in the reign of Kotoku (645-654) when the use of milk as medicine was introduced, but such use was discouraged by Buddhism. Horses came into use very early for the saddle and as beasts of burden; indeed the northeastern provinces were celebrated for their horse breeding.

The use of livestock as meat came gradually into use and even swine were raised to some extent. But after Buddhism came into power the Government prohibited the slaughtering of livestock, so the raising of swine was stopped entirely. Cattle were then used solely as beasts of burden and for cultivation, for which purpose small farmers often preferred them to horses, especially in mountainous districts.

It is evident, therefore, that Japanese agriculture must have been the tilling husbandry from the very beginning and remains so to the present day, except in mountainous districts where large tracts of natural pasture are found, on which cattle and horse-breeding is conducted by farmers. The Japanese greatly esteemed agriculture and believed in the Chinese saying, translated into Japanese, «No wa Kuni no moto,» which means, «agriculture is the foundation of the country,» and every sagacious emperor and his advisers encouraged the improvement of agriculture, mainly after the Chinese pattern. But before the establishment of feudalism, when the nobles became very powerful, its encouragement was largely neglected and the land gradually fell into the possession of a few, and heavy rent was levied by landlords. From that time also, on account of the disturbance of internal peace, farmers suffered, and agriculture greatly declined. Notwithstanding these discouragements, various circumstances helped the farmers to improve their agriculture, and new crops and improved implements were gradually introduced, and in some districts agriculture made noteworthy progress. But universal progress began only after the restoration of peace by Taiko Hideyoshi. During the eras Keicho and Genna (1596-1623) many important crops were introduced, among which may be mentioned cotton (which indeed had been introduced once before), tobacco, potatoes, sweet potatoes, sugar cane, etc. Under the long peaceful Shogunate of Tokugawa, agriculture flourished and made great progress. As the country became closed to foreign intercourse, the people were more and more dependent upon agriculture to supply their needs, and Tokugawa Shogun and many feudal lords greatly encouraged it on their estates, though there were other lords who cared very little for their people, and there, under heavy tax, agriculture could not make much progress. Thus even at present, great differences can be seen in the state of agriculture in various localities. After the restoration to power of the Mikado, and the beginning of the Meiji era, there was rapid and great progress, which will be treated under another heading.

2. Area of the Land under Cultivation and Crops Cultivated.—Though agriculture is conducted very intensively, and especially in the warmer part of the country, terracing is employed on an extended scale* on account of the predominant mountainous character of the country and on account of the method of farming which is based principally on rice cultivation. Mixed farming is almost entirely unknown except in the mountainous districts, and the percentage of the land under cultivation is

*Professor Rein in his work on 'Industrial Japan' much underrates the extent of terracing; he appears not to have seen it in Shikoku, Chiugoku, etc.

therefore very small. Indeed with the exception of Hokkaido, which may be regarded as a colony, and where a large extent of land is not yet broken, and Formosa, which was only recently annexed, 17 per cent. may be taken as a fair estimate of the cultivated land. If we compare this percentage with 53.5 per cent. for Belgium, 53.3 per cent. for France, 49.3 per cent. for Germany, or even 19.0 per cent. for Switzerland, it will be seen how low is the percentage in Japan.

The following figures, according to recent statistics, will show how much agricultural land is under cultivation (excepting Hokkaido and Formosa):

	Cho.*	Percentage of whole area.
Land under crops	5,186,148.4	17.0
Forests	16,362,970.4	56.9
Harai and Pasture	1,731,272.7	1.5

The land under cultivation is divided into «ta» (paddy fields) and «hata» (dry-land fields), the former amounting to 2,822,856.2 cho and the latter to 2,363,292.2 cho. Paddy fields are almost all devoted to rice. But rice is not the only crop which is cultivated in ta, for the climate in the larger part of the country is such that two crops a year can be obtained if the soil is sufficiently drained, indeed the recent government report shows that the area of ta under two crops is 37 per cent. So-called «aftercrops» of rice consist now-a-days mainly of barley; rape cultivation which formerly was extensively practiced being now much decreased, and Gengeso or Rengeso (Astragalus siricus) cultivation, used as green manure, is now being encouraged.

Dry-land fields are more variously cultivated. Their principal use is of course for the cultivation of food crops such as wheat, barley, upland rice, Indian corn, soybean, adzuki, Indian millets, buckwheat, sweet potatoes, potatoes, taro, radish (which is very different from the occidental radish, being much larger and longer), etc. Barley is mainly divided into two varieties, naked and with husk, the former being suited especially for warmer districts and that with husk for colder parts, but as naked barley is easier to handle, its cultivation seems to increase more and more, supplanting common barley. Common barley is much used as food for livestock and for other purposes, but its principal use is for human food; naked barley, on the other hand, being almost exclusively used for human food.

Industrial crops are cultivated with few exceptions, such as i (Juncus effusus) and Shichito i (Cyperus tegetiformis) in dry-land fields. Sugar-cane, cotton (which decreased from 55,541 cho in 1895 to 12,870 cho in 1904 on account of the amount of cotton imported), tea plant, ai (Polygonum tinctorium), hemp, tobacco, paper mulberry, rape, sesamun, waxtree, ginseng, lacquer tree, peppermint are the principal industrial crops. The area of crops under cultivation and their productiveness, as returned in the recent census, may be seen from the figures of the following table:

	Cho	Koku
Rice	2,880,714.9	51,430,221
Barley	651,680.8	8,927,025
Naked Barley	690,069.0	6,856,232
Wheat	458,643.2	3,858,990
Awa	213,630.5	1,980,989
Hiye	64,386.7	926,877
Millet	33,899.1	374,390
Buckwheat	167,673.6	1,176,223
Soybean	446,843.9	3,710,459
Adzuki	126,028.1	730,097
		Kwan
Sweet Potato	279,774.3	660,495,079
Potato	47,286.1	81,820,412
Rape	145,553.1	1,019,960
Cotton	12,870.4	*2,820,673
Hemp	15,716.6	2,727,233
Ai	24,662.7	†9,173,055
Tobacco	32,577.8	12,803,863
Tea	50,782.2	7,038,254

One of the most important crops, mulberry, is estimated at 324,941.6 cho, and the number of lacquer trees is 2,630,656 (lacquer 50,341 Kwan.)

On dry-land fields, two crops may generally be taken and even three crops a year are not exceptional, especially in the warmer provinces. It may be remarked that most cereals can be, and indeed are, generally cultivated year after year in succession without fallowing, not only on paddy fields, but also on dry-land fields. Indeed rotation of crops is not much practiced unless it is absolutely necessary with certain crops which will not bear cultivation successively. At present the area of fruit trees is undoubtedly fast increasing, among which may be mentioned mikan or Japanese oranges, pears, peaches, Kaki (Diosporya Kaki) apples, grapes, etc. Apples were introduced in the beginning of the Meiji era, and they are extensively cultivated, especially in the northeastern provinces and Hokkaido, though unfortunately on account of downy aphis they suffer much damage, and in some districts their cultivation has been entirely given up. Vegetables and flowers are much cultivated especially in the vicinity of towns and cities, but not within enclosure as in Europe, market gardens being all in open fields and cannot be distinguished from common farms. There are special gardens, commonly within enclosures, where specialists called Wuyekiya (tree growers) raise ornamental trees and shrubs, flowers, special dwarf trees in pots, etc. These gardeners are distinguished from agriculturists.

3. Agricultural Implements.—Under so small and so intensive a farming, it is no wonder that the implements used are so simple and so rude. The plow (Karasuki) «resembles in its commonest form that of Egypt, which is made and used to-day just as in the time of the Pharaohs.» This statement by Professor Rein is true, but it is also true that it can cut very deep, even a foot or more, and for making high ridges it is very serviceable. There are many kinds of plows but they are seldom used on dry-land fields, the reason being that the «between crops» and «catch crops» make plowing very difficult; and besides the common forms of plows are not suitable for use on dry-land fields. Even on paddy fields plowing is not general, for there are yet many fields, especially in the northeastern provinces, which are undrained and covered with water the year round.

*One cho equals 2.5 acres.
†Grassland for forage and for manure is but very little used.

*With seed. †Leaf.

Instead of the harrow, farmers use «maguwa,» which is a kind of rake. Except the plow, harrow, and the carts sometimes used, there are almost no agricultural implements used with the horse.

A hand implement for digging extensively used is «Kuwa,» which is often erroneously translated hoe, but which may be properly named a broad-shared mattock. Kuwa is the simplest and most serviceable of all implements. With it the farmer can dig, break clods, pulverize the soil, even press the surface, make high ridges and small and shallow furrows for sowing in rows, cultivate between the rows, dig holes, etc. One of its kind named «Bitschukuwa» has its share divided into three or four teeth, and is used to dig paddy fields when wet. Spades are used in some of the districts.

An implement especially constructed to cultivate between rice is named «Ganzume,» and has long curved teeth and a short handle. Harvesting is done entirely with a sickle (Kama). Cereals are threshed generally with a comb-like implement something like a flax rippler) «inekogi» or «mugikogi.» Grains are chaffed with a specially constructed mill (momisuri-usu.)

4. Principal Manures.—From remote ages Japanese farmers have understood how to preserve the soil from exhaustion by using manure. The manure par excellence was and is human excrement. The water closet is generally provided with two earthen jars, one to receive the excrement and another to receive the urine. Farmers reserve these two excreta, mixing both in a large earthen jar or tub, lightly roofing over to exclude rainwater and sunshine. After they have rotted and the urea is changed into ammonia, they are diluted with a large quantity of water and are spread upon the soil. They are often mixed in making compost.

Green manures are largely used, the most common form being grass cut from natural meadows called «magusaba,» or from undergrass in forests; buds, young leaves and shoots of forest trees are also used. «Genge» and soybean are often sown in paddy fields and plowed in as green manure.

Compost manure also plays a great rôle. It is of many kinds, the principal of which is made of farmyard manure, often with a large quantity of grass used as litter. Compost is also made of earth mixed with dead leaves from forests. In districts where farming is intensively conducted, compost is carefully made in a small hut especially constructed for the purpose.

Rape cake is extensively used and was formerly the only manure to be bought. It has now decreased to some extent, but its place is more than replaced by soybean cake imported from China and Corea. Fish manures are extensively used, the principal of which is herring cake, dried sardine and sardine cake.

Rice cleanings are used as manure as well as for food for livestock. Wood and straw ashes are extensively used, being the only potash manure. Lime is much used, especially in paddy fields in the warmer half of the country, but as great harm is done by a too free application of lime, some local governments prohibit its use.

Artificial manures are now extensively used, and many factories have been established to manufacture them, phosphatic minerals being chiefly imported from America. Phosphatic guanos from various islands are also used in manufacturing superphosphate. Superphosphate alone, or with ammonia and potash salts, is sold under the name of artificial manure, complete manure, etc. Farmers in some provinces are now trying ammonia sulphate as manure.

5. Livestock.—Cattle and horses are as yet not so numerous as in occidental countries, and meat, milk, butter and cheese are not so extensively used. Milch cows are not kept by farmers, but by special dairy establishments, all food for these cows having to be purchased. Japanese cows have very poor milking quality, so that these dairy establishments depend entirely upon occidental breeds such as Holstein, Ayrshire, Jersey, Swiss Brown, etc. Japanese breeds are very small but very good as working animals and farmers generally use cows instead of oxen. Their meat has a most excellent flavor.

More horses than cattle are used in agriculture, but they are small in size and of primitive breed. The number of cattle and horses is as follows: cattle, 1,200,135 (cows, 762,246; bulls, 437,889; milch cows, 30,852); horses, 1,390,017. Cattle used in cultivation, 952,775 (46.83 per cent.); horses used in cultivation, 1,082,895 (53.17 per cent.). Livestock other than cattle and horses are exceedingly small in number. Sheep were introduced some 32 years ago but without much success, the result barely showing that, notwithstanding the humidity of the climate, they can be raised. The raising of pigs is being much encouraged, and the industry is increasing rapidly. Recent statistics give numbers as follows: sheep, 2,769; goats, 67,972; pigs, 191,952.

Fowls are extensively kept by small farmers. Many varieties were introduced at various times during the Tokugawa shogunate but little care was given to breeding, and they all seem to have greatly degenerated. Great attention, however, is now being paid to breeding and many new varieties are being introduced, but generally speaking, fowl-raising is not yet well understood by farmers, and although quite a large number is kept, something like 1,000,000 yen of fowl eggs is imported every year from China. Duck-raising is not given much attention. Bees are kept in a few districts to some extent, but the art of keeping bees is yet in a very backward condition.

One of the most important industries of Japan is the silk industry, sericulture being extensively conducted by small farmers, who have plenty of labor well suited to it. Silkworms are mainly divided into two kinds, common silkworms and wild silkworms, the former of which is raised within the house and is the principal one. The eggs, or graines, are raised principally by specialists, the art being a very difficult one. The egg raisers have generally a very large house specially constructed and well fitted for sericulture. Farmers, on the other hand, generally use one or more rooms of their houses which they can spare during the season. Farmers often raise silkworms two or three times a year, and plant mulberry trees in plantations, around the fields, on road sides or near their dwellings.

6. General Features of Japanese Agriculture.—Japan with her oceanic climate, being located within the boundary of the monsoon, is well suited to rice cultivation, especially in the warmer portion. In the colder section, though rice is also the principal crop, its cultivation extending up to 43° 30′ N. lat., it is rather a risky crop owing to the shortness of summer—hot weather not lasting long enough for its maturing. The wheat and barley crops are also exceedingly risky, for during harvest time, which may be anywhere between the end of May and the beginning of July, the season is liable to be very wet.

Soils vary greatly, often changing within a mile. One kind of soil which deserves special notice contains a large percentage of volcanic ash, very light, with high water capacity and great absorptive power, and occurs to a large extent in Kuwanto and Kiushiu. As a rule, soils are not very rich, and need to be carefully cultivated and well manured.

With such climate and soils, combined with the mountainous character of the country, farming on a large scale cannot be profitable, which accounts for the small farms, the holdings on an average not being more than one cho, or 2.5 acres. Farms of more than five cho are rare exceptions.

Though there are many landlords in Japan, the land is much more equally distributed than in some parts of Europe. Nevertheless farmers cultivating small holdings are not all peasant proprietors, tenancy being by no means rare, which may be seen from the following table:

	Ta.	Hata.
Farming on own land	50.21 per cent.	60.93 per cent
Tenancy	49.79 " "	39.07 " "

These small farmers have to pay a heavy tax on each acre of land, central and local, and for tenants the rent is exceedingly high. The rent varies of course according to circumstances, but generally speaking it is equal to about one-half to two-thirds of the produce in the case of paddy fields, aftercrops being excluded. The rent is generally paid in kind, rice in the case of paddy fields; soybean, barley, or sometimes money, in the case of dry-land fields. Almost no metayage is known, and the tenancy is such that the rent is fixed according to custom, its value changing only very gradually. Owing to various historical causes and also to the fact that paddy fields if not well drained are unsuitable for the erection of buildings, the houses, which often serve both as dwellings and farm buildings, or which are in close connection with the latter, are grouped together into villages or built along the roadside. There are almost no enclosed farms with buildings in the centre, and it is very difficult to make students in Japan understand the meaning of farm in the occidental sense of the word. Paddy and dry-land fields are divided into small parcels, side by side, having no fences, the paddy fields being separated by small ridges designed to hold the water of irrigation on the surface. Each parcel has its owner, but the fields being scattered involves a great drawback to the economy of labor.

These small farmers, often with less than one cho of land, frequently cultivate only one crop of rice, which is sown in sudbeds at the end of April or at the beginning of May and planted in the month of June. The harvest time is from September till November. Where two crops are obtained, the field is cultivated soon after the harvest, and harvest time comes just before rice planting. The farmer's working days are therefore very unequally distributed. Where they have to cultivate dry-land fields their labor is more equally distributed, but then the acreage they have to manage is so small that the work on the farm is not enough for the full employment of their labor, and their income is naturally often not enough to live upon. So the farmers are obliged to resort to various industries other than farming. Formerly the farmers had to spin and weave their own clothes, but now that this is being done by factories, they have to seek other industries, such as sericulture, silk reeling, tea culture, mat making, sugar manufacture, starch manufacture, weaving rice straw mat, making strawplait from barley, weaving cotton and silk goods as commercial articles, making baskets from bamboo stem, and making wood shaving plait. Keeping fowls and swine must be enumerated among these by-industries of Japanese farmers; also forest culture to obtain material to make charcoal, wooden articles, etc.

Small farmers sell their labor to large farmers, or to factories if any such exists in the neighborhood, or seek employment elsewhere. These small farmers, 55 per cent. of whom cultivate below eight tan, with plenty of labor, must naturally farm their land in the most intensive manner possible, thoroughly cultivating, weeding, manuring, which may fairly be designated as gardening. Indeed in rice culture farmers spend some 20 to 25 days' labor per tan, which is equal to 80 or 100 days' labor per acre. For other cereals some 15 days must be allowed per tan. It would seem that the product should be very large. But the statistics show but an ordinary average. For example, rice gives, on an average, about 1.5 koku of husked grain per tan, which is equal to about 30 bushels per acre; barley little less than 1.3 koku or 26 bushels per acre; wheat little more than 0.86 koku or 17 bushels per acre, which certainly are not good crops. The figures quoted above may be too low; on the other hand, even very poor soils are sometimes cultivated by industrious farmers year after year successively without fallowing, as already shown. The climate also is not suited to barley and wheat. These facts must lower the average. So that if we take a medium crop at two to three koku per tan for rice (40 to 60 bushels per acre), or even four koku per tan (90 bushels per acre), in very good soil, and two to three koku per tan for barley, we are probably more nearly right as regards the product of intensive farming.

Notwithstanding such intensive farming, land population is too dense, and small farmers can hardly subsist, especially those who hire the land under the burden of heavy rent, and those who live in the colder districts. Immigration, inland and abroad, and employment elsewhere are depended on to obviate the bad conditions, but improvement in agriculture and more extended employment in by-industries are absolutely necessary to these farmers.

7. Recent Progress of Agriculture.—With the downfall of the Shogunate and the opening of the country to foreign intercourse, great changes began to take place everywhere, both in political and in economical spheres. Under the influence of foreign trade and industrial development at home, the farmers lost some by-industries, such as spinning and weaving, and some of their crops declined, as cotton, rape, soybean, ai, hemp, etc., but in many branches there has been great development and progress, as in sericulture and the tea industry, as the government statistics show.

The silk industry was formerly restricted to a few localities, but the export of raw silk has become so extensive that there is now almost no locality without some production of cocoons. So also with the tea industry. Tea was formerly produced in various localities, but had very small market. When, however, it found a foreign market its increase was very rapid, although there seems at present an overproduction, while the silk industry seems to have no limit for its expansion. The following figures will show the progress in these two important industries:

Years.	Cocoons, koku (average per year).	Tea, kwan (average per year).
1886-1895	1,302,845.4	5,596,588.8
1896-1904	2,399,294.2	7,669,592.1

The production of rice has undoubtedly increased very greatly, but the statistics show only very small increase in the acreage of rice culture and in the amount of production, which may be seen from the following table:

Years.	Acreage in average per year, Cho.	Production in husked rice average per yr., Koku.
1886-1895	2,704,064.2	38,244,157.7
1896-1904	2,828,740.1	42,954,300.0

But when we remember that some 20 years ago 2.5 koku per tan was considered a tolerably good harvest, in the same districts less than three koku is not considered a good crop at present, and the harvest of four koku per tan is not rare. And we may conclude the progress is much larger than is shown by the above statistics, for in recent years many good kinds of new crops and new varieties have been introduced, and the quantity of manure used has been exceedingly large, the demand for which could not be satisfied without importing large quantities from abroad each year, amounting to more than 10,000,000 yen.

Efforts have successfully been made to introduce many good breeds of livestock from Europe and America, especially cattle for dairy purposes. Great improvement is noticed in the breeds of fowls, good breeds being largely introduced from abroad.

Farmers are becoming aware of the value and usefulness of science, and under the guidance of experts, directly or indirectly, they are making a gradual but constant improvement, which must of course result in increased production. Governments, central and local, are making constant effort to introduce improvements in agriculture and assist the farmer.

Agricultural education is encouraged. Agricultural instructions are given in the higher primary schools of villages and there are more than 1,000 supplementary schools for agriculture, after the method of the Fortbildungsschool of Germany. Agricultural schools are divided into two classes, higher and lower, almost every prefecture having one or more of the former, and various counties having the latter; special schools, especially for sericulture and veterinary, not being wanting. There are at present three higher agricultural schools, two government establishments, and one private school in Tokyo established by the Agricultural Society of Japan. One of these in Hokkaido is now being promoted into an agricultural college of a new Imperial university which is to be established, while a new higher agricultural school will be established in Kiushiu. There is at present one agricultural college in the Tokyo University. This college has two courses of different grades, one of which is subsidiary in grade to the higher agricultural schools and the other course is intended for the training of teachers of agriculture. Agricultural courses are given in the common and higher normal schools. Local agricultural schools receive aid from the national funds. Agricultural courses of a few weeks are being given in various places of every prefecture. Lectures for farmers are well attended and show excellent results.

There are two sericultural institutes established by the government, one is in Tokyo, the other in Kioto, in which investigations on sericultural matters (in the former also on silk reeling) are made, and higher instruction on this branch of industry is given. Similar institutes, but local and lower in grade, number more than 600.

Experiment stations are many. One central station with its branch stations is supported by government, its work being divided into the following branches: (1) Agriculture proper; (2) Agricultural chemistry; (3) Agronomy; (4) Vegetable pathology; (5) Entomology; (6) Cattle feeding; (7) Tobacco culture; (8) Horticulture; (9) Tea industry. Almost every prefecture has an experiment station, aid being given from the national fund; many countries and villages have trial fields.

Agricultural societies are divided into village societies, county societies and prefecture societies, there being one in every prefecture, in every county, in nearly all villages according to the law relating to agricultural societies, and aid is given from the national fund and often from local governments, counties and villages. There are also many general and special societies aside from those established according to the law relating to agricultural associations.

Prefectures and counties often employ agricultural, dendrological, sericultural and other experts to give free lectures to farmers, and the central and local governments often hold industrial and agricultural exhibitions.

The government is now making a great effort to promote co-operative associations, including a credit corporation. These corporations are all exceedingly important for the small farmers of Japan and they now number 2,455. Besides the law passed in 1900 relating to agricultural and industrial corporations, there exists a law relating to associations for important products, a law relating to livestock breeding associations, and a law relating to

tea industry associations, all of which seek to promote these respective industries on the basis of co-operative principles. Great efforts are also being made to promote sericulture by giving special instruction, and a law has been passed to prevent silkworm diseases by securing to the farmer good and sound eggs.

Among the means to promote the improvement of livestock, large pasture has been established in the Imperial domains where good breeds of horses and cattle are raised. The government has also established two stud farms and nine stallion depots, one cattle-breeding farm, with its branch depot where swine and fowls are kept for breeding purposes. Laws have been passed as follows: for the inspection of stallions (1897); for the prevention of animal plagues (1896); and for the prevention of bovine tuberculosis (1901).

Preventive and destructive means against injurious insects are under the guidance of experts and are gradually coming into use among farmers. A law designed to enforce, when necessary, the means for prevention was passed in 1896.

To prevent fraud in artificial manures, a law was passed providing for the supervision of all commercial fertilizers and each prefecture has a chemical laboratory to analyze the manure whenever requested. Besides credit corporations to provide small capital, the government has established the Industrial Bank of Japan, which is a central and special *credit foncier*, and local agricultural and industrial banks of similar nature. These banks lend capital for agricultural and other industries on mortgage, allowing a low interest on a long term.

Land improvements are now going on very rapidly with the aid of the national and local funds, especially to promote drainage and irrigation in paddy fields and to overcome the small size and irregular form of the land parcels, which has been a great drawback in tilling operations. To this end the law relating to adjustment of farm lands was promulgated in 1899. Finally it may be stated that many agricultural products are feeling the pressure from without, on account of the keen competition, which may result in reduced prices. Some think that sooner or later Japanese agriculture will be conducted on a large scale, but those who know the climate and the contour of the country do not believe that Japanese farming could be organized on the occidental large farming system.

TOKIYOSHI YOKOI,
Professor of Agriculture in the Imperial University, Tokyo.

15. Japan—Internal Improvements; Communications and Transportations. *Posts.*—Letter Post.—Though in an imperfect form, the mail service had long existed in Japan. In the Shogunate dynasty the official letters were regularly carried between the capital and the provinces, and it was then that the private post service was first brought to existence. On the advent of the Imperial Government, it was decided to run the postal service modelled on the western system as an official undertaking, and consequently, in January 1871, the new postal service system was promulgated. Postage stamps were issued at the same time. In the following year, the business was extended almost over the whole Empire, and people were forbidden to engage in the business of the transmission and delivery of letters; the state monopoly of the letter post was now settled firmly. In 1873, the postal fee was made uniform irrespective of distance, and after a little while postcards and wrappers were issued.

In the same year, the Post Exchange Contract was concluded with the United States of America. Up to this time, the foreign mail service could be carried on by the Japanese Government only through the Postal Agencies of Great Britain, the United States and France, which were actually conducting postal business in the open ports of Japan: Yokohama, Kobé and Nagasaki. On 1 Jan. 1875, the United States' post offices established in Japan were closed, and all of the rest of the foreign postal agencies in the country were abolished by 1880. In the year 1876, a Japanese postoffice was opened at Shanghai, China; since then a large number of Japanese postal offices have been set up in China and Korea.

Thus, the service being carried on progressively and effectively, the Government entered into the Universal Postal Union in June 1877, just two years after the formation of the Union. In 1886, the business, together with the telegraph service, came under the control of the Department of Communications, and it was at the same time that the telegraph service, which had been previously under the control of the Department of Public Works, was transferred to postoffices specially established; the object, of course, being to conduct them more effectively and economically.

As to the adminstrative system of the local postoffices, Japan experienced several kinds, but at last in 1893, the problem was settled; the whole country was divided into 18 postal districts, each one having in it one so-called First Class Post Office, which, on the one hand controlled the services at all the postoffices existing in its jurisdiction, and on the other, attended to the matters of ordinary post and telegraph services; and this system has been in use since that time.

As soon as the China-Japan War began (1894), a Field Postal Service was established, dependent upon the orders of the Department of Communications, and the service proved an inestimable boon to the military and naval forces. In October 1900, the present Postal Law was published superseding the Postal Regulations, which had proved inadequate. The principle declaring the postal service to be a government monopoly was set forth with great distinctness by this law, the secrecy of letters was guarded with greater strictness, the reimbursement in case of damage or loss, that had previously been confined to parcels with value declared, was extended in scope and made to include many other kinds of mail matter. At the same time, the letter cards were newly issued, and the system of private cards and the collection of cash system were instituted.

During the recent war with Russia, the field post service was carried on again to a great extent, while all of the letters and money orders intended for Russian prisoners, or despatched by them, were sent free of postal rates.

In 1904, the postal service in Korea, together with the telegraph business in the country, was entrusted to the Japanese Government, and this service is now under the control of the Resident General in Seoul.

Parcel Post.—This service was, in the year of its inception (1892), confined only to the postoffices situated in the principal cities. But it was gradually extended, and since 1900, postoffices that handle ordinary mail have undertaken the parcel service as well. The rates were revised in 1902, and one charge was ordered for the same weight irrespective of distance, except in case of city mails.

Postal Money Orders.—The postal money order system was inaugurated in 1875, about four years later than the general post service. Ten years afterwards, the principle embodied in the system was extended to the telegraph service, and at the same time, the petty money order system was inaugurated. In the year 1900, all of the postoffices were made to deal with this business even on Sundays and other holidays. By this time the foreign postal money order system had been established; and in Japan one is now enabled to send or receive money to or from almost any country in the world. The system of paying money orders at residences, and of transferring them by means of crossing, was provided long ago.

Postal Savings Bank.—This institution was non-existent in Japan until lately. But after half a year's practice in Tokyo, the service was immediately extended throughout the country in December 1875. Each person is now allowed to deposit an amount up to 1,000 yen; provided he keeps a deposit exceeding the regulation limit by the way of purchasing government loan bonds in the custody of the postoffice. The rate of interest is 5.04 per cent. per annum.

The Postal Check System.—This was introduced in April 1906, and proved a great convenience in the monetary transactions.

Telegraphs.—The introduction of the telegraph instrument into Japan took place in 1853, when two sets of the implement were presented by Commodore Perry to the Tokugawa Shogunate. But it was in 1868 that Japan possessed for the first time the service of the telegraph. In 1873, the Telegraph Code and the Telegraph Service Rules were promulgated, placing the service on a regular basis. At the outbreak of the civil war in Kyushu, the service demonstrated with convincing efficacy its usefulness and importance, and after that the progress of the business in Japan was very rapid.

In 1871, the Japanese Government approached the Great Northern Telegraph Company, and induced it to lay cables connecting Nagasaki with Shanghai and Vladivostock, and 12 years afterwards an agreement was entered into between Japan and Korea for laying the Japan-Korea Cable, the work of which was undertaken by the above mentioned company. At that time Japan was still obliged to depend upon the service of foreigners in the work of cable laying, though, in the course of time Japanese experts became fully qualified for it, and now all the work of telegraphic engineering is undertaken by Japanese.

Thus, the telegraph service in Japan being in a state of satisfactory development, Japan joined the International Telegraph Convention in 1879, and in 1884 entered the International League for the Protection of Submarine Cables. The Telegraph Code and the Service Regulations were revised in 1885, and uniform charges were made, except on telegrams sent within a town and those despatched or received in Iki and Tsushima Islands, where, in those days, the messages were sent by the cables of the Great Northern Telegraph Company.

The China-Japan War supplied an unusual occasion for displaying the efficiency of the service. The lines for the use of the army were specially constructed through the interior of Korea, and also new lines were greatly extended in the homeland. The termination of the war and the annexation of Formosa were signalized both by the laying of a cable between it and Japan proper, and the purchase of the cable connecting the island and Fuchow from the Chinese Government.

During the recent war with Russia a great sum was spent in extending the land lines and inland cables, and it is needless to add that the progress of the business since the termination of the war is quite marvellous.

With the opening of the San Francisco-Manilla Cable, and of the Tokyo-Guam Cable in 1906, the transmission of telegrams between Japan and Europe and America is no longer necessarily wired via Shanghai or Vladivostock. Japan has occupied, as far as the telegraph service is concerned, a central position linking together the two hemispheres of the world.

Telephones.—At the time of the introduc-

tion of the telephone into Japan, there was talk of leaving the business to private enterprise, but this idea was given up, and it was decided that this service should be undertaken by the Government. In December 1890, the telephone service was opened in Tokyo and in Yokohama and also between the two cities. At first, people did not appreciate the benefits of the service, and the number of subscribers was extremely limited. However, this state of affairs lasted only for a short time, for when the service was opened in Osaka and in Kobé and between these two towns in 1893, many other cities petitioned the central authorities requesting that a telephone exchange should be opened in their districts.

The service developed step by step parallel with the growth of economical conditions in the country. In 1897, and again in 1906, Telephone Exchange Rules were revised, and in 1899, the long distance service was opened between Tokyo, Yokohama, Osaka, Kioto and other cities.

The progress of the service, since the peace with Russia in 1905, is quite noticeable; but still the telephone business in Japan cannot yet be said to be in a very satisfactory condition when compared with Europe or America.

Shipping and Navigation.—The reason why not only established a regular coasting service, but extended it to Shanghai in the following year. When the Japan Mail Steamship Company ceased to exist, the Government purchased the vessels owned by the company and transferred them to Mitsubishi & Company, who succeeded to the business of the former, altering its name to Mitsubishi Steamship Company. Since then, by the aid of Government subsidy, the routes of the company have been extended to Newchang, Tientsin, Chefoo in China, Vladivostock in Russia, and Fusan and Gensan in Korea. In 1882, the Government established the Kyodo Unyu Kaisha (Union Steamship Company) with a capital of 6,000,000 yen. After a disastrous competition, the Kyodo Unyu Kaisha and Mitsubishi Steamship Company were amalgamated into one company in 1885; the new company being called the Nippon Yusen Kaisha, and it continues to the present time. The Government guaranteed the rate of profit of this company during the first 15 years after its establishment. In 1887 the guaranteeing of profit was altered into granting a certain fixed amount of subsidy. In 1884 the Osaka Shosen Kaisha (Osaka Merchant Shipping Company) was established, and afterwards, receiving the Government subsidy for some years, carried the

a maritime country like Japan remained so long without making any substantial progress in navigation may fairly be attributed to the prohibition by the Tokugawa Government, about 300 years ago, of the construction of ocean-going vessels, in order to cut off intercourse with foreign nations. The effect of this policy upon the spirit of enterprise, so far as navigation is concerned, was not wholly swept away after the Restoration. In 1869 and 1870, the Government made repeated announcements to encourage and to protect maritime undertakings. In consequence, a navigation company named the Kaiso Kaisha was established, being the pioneer in the maritime enterprise with vessels of foreign form of construction in Japan. The Government supported the company, granting a certain number of vessels, and then a regular coasting navigation was established for the first time in Japan. In 1872, the said company was dissolved and a new company, called the Japan Mail Steamship Company, was created in its place.

After the expedition against Formosa in 1874, the Government turned over to Mitsubishi & Company a certain number of foreign-built steamers, and accordingly, that company regular coasting service. Thus at the end of 1893 there were 680 steamers of 176,915 tons and 746 sailing vessels of 48,303 tons, making a total of 1,426 ships registering 225,218 tons.

The war with China in 1894-5 resulted in a great increase of the number of vessels, which were used in opening several new lines. At the same time, the Government began to encourage the foreign regular service by way of granting subsidies. Accordingly, many new lines were opened, as follows: Yokohama-Adelaide, Yokohama-Bombay, Japan-Europe and Hongkong-Seattle of Nippon Yusen Kaisha; Shanghai-Hankow and Hankow-Ichang of Osaka Shosen Kaisha; Shanghai-Suchow, Shanghai-Hangchow and Suchow-Hangchow of Daito Kisen Kaisha; and Niigata-Vladivostock and Hakodate-Korsakovsk of Oie Hichihei; and Hongkong-San Francisco of Toyo Kisen Kaisha.

Besides the protection given to the special routes, the more comprehensive method of encouraging the shipping trade in general was adopted in 1896 by the Law of Encouraging Navigation. According to this law, a bounty at the rate of 25 sen per ton per 1,000 miles covered was granted to Japanese shipowners engaging in the business of transportation of

goods and passengers, with an iron or steel steamer of 1,000 tons gross and having maximum speed of 10 knots per hour, either between various foreign ports or between ports of Japan and those of foreign countries. Henceforth, shipping made rapid progress, so that at the end of 1903 there were 1,570 steamers of 663,220 tons and 3,934 sailing vessels of 328,953 tons, —a four-fold increase during the interval of 10 years.

The Japan-Russia War necessitated a great number of vessels for transport. Foreign vessels were bought, and special permission was given to use foreign vessels in the coasting trade. After the war, the increased bottoms were used in carrying foreign trade more efficiently.

Shipbuilding.—With only imperfect experience and insufficient materials, Japanese shipbuilders could at first build only sailing ships and small steamers, so that Japan had to depend on foreign shipyards, whenever any large steamers were to be built. The Government being eager to encourage home shipbuilding, the Shipbuilding Encouraging Law was promulgated in March, 1896. By this law, a bounty is granted, at the rate of 12 yen per ton gross in case of vessels of not less than 700 but less than 1,000 tons gross, and 20 yen per ton gross in case of and above 1,000 tons gross, to ships of iron or steel, constructed in accordance with the provisions of the Shipbuilding Regulation. Besides, an additional bounty of 5 yen per indicated horse-power is granted in cases where engines are also manufactured. Moreover, the Law of Encouraging Navigation provides that ships built in Japan are entitled to more bounty than those built at foreign shipyards.

By these stimulations, the shipbuilding industry made rapid progress, so that two years later, Japanese shipbuilders succeeded in building a large steamer of 6,000 tons, well qualified for ocean navigation. As the provisions of the Shipbuilding Regulations are mainly in accordance with those of English Lloyds, the ships built under these regulations have the same qualifications as those classified in the Classification Societies. At present, ships of large size and warships of high power can be built at home. We may mention, as showing the remarkable progress of shipbuilding in Japan, that the great battleship *Satsuma* was launched at Yokosuka in 1906, and that two Pacific liners of 13,500 tons are now building at Nagasaki which will be finished in 1908.

Lighthouses.—In the Tariff Conventions of 1866, which were concluded respectively with Great Britain, France, United States of America and Holland, Japan agreed to construct lighthouses and other nautical signals, in order to secure the safety of vessels entering or clearing at the open ports of the Empire. Japan immediately started to construct lighthouses, etc., and at first, English engineers and artisans were engaged, and they remained in the service until 1879. Since that time Japanese have performed the work, and a great sum of money is spent every year in constructing nautical signals along the coasts of the whole country.

Docks.—The first dock in Japan was established on a small scale by the Government at Nagasaki. Afterwards, it was purchased by the Mitsubishi firm, under whose management it has developed into the most important dockyard in the Far East. The Third Dock, being the largest one in the establishment, measures 728 feet in length, and can take a ship of more than 20,000 tons with little difficulty. Another important dockyard, Kawasaki Dockyard, is at Kobé. This was also originally established by the government, but afterwards passed into the possession of the private firm. After the war with China there was an urgent demand for docks, owing to the rapid increase of shipping, and docks were constructed at several places; namely Kobé, Yokohama, Uraga, etc. The Mitsubishi Dockyard, built at Kobé in 1905, a floating dock of 7,000 tons lifting power, which is of sectional pontoon type with continuous wall, and in 1907 built a large floating dock of 12,000 tons lifting power. In the Mitsubishi Dockyard at Nagasaki, an experimental tank is being constructed which, when finished, may claim the honor of being the first experimental tank in the East.

THE NUMBER AND GROSS TONNAGE OF VESSELS

At the end of	Steamers		Sailing vessels		Total	
	No.	Gr. ton	No.	Gr. ton	No.	Gr. ton

Open Ports.—At present, there are 33 ports

open to foreign trade: Yokohama, Kobé, Niigata, Ebisuminato, Osaka, Nagasaki, Hakodate, Shimidzu, Taketoyo, Yokkaichi, Itozaki, Shimonoseki, Moji, Wakamatsu, Hakata, Karatsu, Suminoye, Kuchinotsu, Misumi, Itsuhara, Sasuna, Shikami, Naha, Hamada, Sakai, Miyatsu, Tsuruga, Nanao, Fushiki, Aomori, Otaru, Kujiro and Muroran. Of these, Yokohama Kobé, Nagasaki and Moji are placed under the Harbor Regulation.

The following table shows the number and tonnage of the ships entered and cleared at these four ports in three years.

Railways—Construction Work.—In December 1867 the Tokugawa Government planned a scheme for the introduction of a railway system in Japan. But, unfortunately, the Restoration War broke out soon afterwards and retarded every step of civilization. Shortly after the Restoration, the new Government again took up the matter. At this time, however, it was very difficult to raise the necessary capital for any new enterprise, because both the Government and the people were then very poor owing to the war. It was, therefore, after encountering a hard struggle that the Government succeeded in creating the first railway bureau, on 19 March, 1870, afterwards making the decision to construct a line between Tokyo and Kobé (now the Tokaido Railway line). Meantime, a number of English engineers arrived, and they laid out the work. On 7 May 1872, the first train ran through from Tokyo to Yokohama, and two years later, there was a line open for traffic in the west from Kobé to Osaka, a distance of 20 miles. In 1877, the western line was extended as far as Kioto, and a few years afterwards Otsu Section was also opened to traffic; so that, at the end of 1880 there were some 58 miles of railway in operation in this district. The excavation work of the Yanagase Tunnel, 4,185 feet in length, located between Nagahama and Tsuruga, and one of the longest tunnels in Japan was completed in November 1883, nearly three and a half years having been spent in its construction.

In the same year, the Nippon Railway Company, the pioneer private railway company in Japan, opened its first section from Tokyo to Kumagae, a distance of 30 miles. The company, incorporated with a capital of 20,000,000 yen, which has since been increased to 66,000,000 yen, obtained in 1881 a charter for laying a line between Tokyo and Aomori, a distance of 445 miles. It was a rather bold undertaking at that time, for not only did the people lack experience in the work, but no data to form any reliable estimate on profit and loss could be procured. In view of these circumstances, the Government agreed to guarantee a profit within a certain limit, and gave every possible convenience tending to further the work, and at the middle of 1884 the company had a total mileage of 63 miles from Tokyo to Takasaki. At this time, the Government was also busily engaged in extending the Tokaido Line to Ogaki, which was opened in April of the same year.

In December 1887, the third section of the Nippon Railway Company was completed as far as Sendai, which is situated about 220 miles north from Tokyo. In 1888, the Sanyo Railway Company was organized with a capital of 13,000,000 yen, which was later increased to 36,000,000 yen. This company's route, running from Kobé to Shimonoseki, a distance of 329 miles, enjoys the distinction of being the most picturesque in Japan. In November of the same year, the first section of the route, from Kobé to Himeji, was opened. In the following year, the Kyushu Railway Company, the pioneer on the island of Kyushu, opened its first section from Hakata to Kurume, a distance of 22 miles. This company was incorporated with a capital of 16,500,000 yen, but, as the result of the absorption of several companies, it has since increased its funds to 62,000,000 yen. The company was originally authorized to construct a line from Moji to Yatsushiro, a distance of 143 miles, and soon afterwards it was chartered to extend its line to Nagasaki with several branches. In the meantime, the Government, recognizing the importance of a more complete system of railways, undertook to build the Northern Line. Its route begins at Takasaki and passing through the Usui mountain reaches Naoyetsu, 117 miles. This section was not opened till 1 April 1893, owing to the numerous engineering difficulties. The nature of the work on this route will be realized when it is stated that no fewer than 26 tunnels had to be excavated; a ratio of four per mile. This was, indeed, the first rack railway constructed in Japan, worked by the Abt System. On the other hand, the Government continued to extend its line by the Tokaido way, and in 1887, the eastward line, from Ogaki to Hamamatsu, and the westward line, from Yokohama to Kodzu, were opened. The through connection between Yokohama and Kobé, a distance of 358 miles, was satisfactorily effected, 16 April 1889.

During 1890, various sections of private railways were completed, and the Hokkaido Government Railway extending from Temiya to Horonai, 62 miles in length, was transferred to the Hokkaido Colliery Railway Company, a private enterprise. A few years later, the

		1903		1904		1905

trunk line of the company was extended to Port Muroran with two branches, a total distance of 60 miles; while the Government built some 160 miles in other divisions. At this time, the Kanson Railway, now the Hokkaido Railway, was organized with a capital of 6,000,000 yen, for the purpose of building a line of 158 miles between Hakodate and Otaru, and the line was completed in October 1904. During the three years from 1886 to 1888, railway undertakings were remarkably active, and many small companies were incorporated, but in the year 1889, the failure of the harvest caused a great business depression, and all new projects were suspended. But at the close of 1891, the Kyushu Railway was opened as far as Saga, and the Sanyo Railway to Onomichi, while the Nippon Railway finished its through communication from Tokyo to Aomori.

In June 1892, the Law of Railway Construction was promulgated, prescribing the route along which Government railways were to be built, and those lines that required more rapid construction were set apart to be developed under the First Period Construction Programme. These lines extended altogether over 1,900 miles approximately, and their construction work had to be completed in 12 years from commencement. Under the Second Period Construction Programme the lines omitted from the First Period Construction Programme, were to be completed, extending some 2,525 miles. Toward the end of 1894, the northern section of the Government Ou Railway Line was finished as far as Hirosaki, while the southern section was completed as far as Shinjo. The work on the Central Line also made steady progress, the section from Nagoya to Nakatsu on the western side, and that from Hachioji to Kofu on the eastern side being completed. All these sections were included in the First Period Construction Programme, and now the Government had a total mileage of some 570 miles. Shortly after the China-Japan War, the business boom brought out a large number of railway schemes, no less than 42 companies being formed simultaneously in the western part of the Empire.

At the close of 1898, Japan possessed 3,420 miles of railways, of which 768 miles were under Government control and the rest worked by private companies, numbering 42 in all. At this time, the Government was busily engaged in building the San-in and Kagoshima lines, both prescribed in the First Period Constructing Programme, and the private companies were active. So that in the year 1906, 34 years after the opening of the Tokyo-Yokohama Line, the Government was in possession of some 1,500 miles of railway, while the private companies extended their lines up to 3,270 miles. On 20 May 1906, a grand banquet was held at Nagoya, for the celebration of the completion of 5,000 miles of railway in Japan. The figures of the following table will indicate the growth of the business in 30 years.

It will be seen from the table that the mileage of Japanese railways has been rapidly increased during past years. In 1878, the number of passengers carried was 2,754,426, whereas in 1905 it was augmented to 113,675,403. During the same period, the volume of goods traffic increased to over 21,000,000 tons, while the total receipts increased from 644,459 to 69,033,165 yen. Thus the growth of traffic has been far beyond the most sanguine expectations and it has contributed to advance the activity of railway enterprises in Japan.

The question of the most suitable gauge for Japanese railways has been a matter of much public discussion, but the standard gauge now generally used is 3 feet 6 inches, while for light railway, which is only 63 miles 62 chains in length at present, 2 feet 6 inches gauge is used.

Legislative Measures.—The first railway regulations were published in February 1872, and they were amended in the following May with the general rules relating to the working of railways. Since then they have been followed by many minor regulations until 1887, when the Regulation of Private Railways was promulgated. Five years later the Law of Railway Construction was enacted. In March 1900, two important railway legislative measures were published: the Private Railway Law and the Law Relating to the Working of Railways, which were put in force on October 1 of that year, abrogating all the regulations prior to the enactments. But the railway legislations of far greater importance were the promulgations in March 1906, of the Railway Nationalization Law and the Law for Purchasing the Seoul-Fusan Railway, in Korea. It will be remembered that the first bill for railway nationalization was introduced in the Diet in 1891, but it failed to get the majority. Early in 1899, the bill again appeared, and it again failed. In the following year a modified bill for the purchase of private railways was introduced in the Diet, but it was annihilated by opposition. In the meanwhile, the Japan-Russia War broke out and all new government schemes, except those directly connected with the war, had to be suspended. Soon after the war the Government took up the matter again, and on March 1906, a bill for the state purchase of railways was introduced in the Diet. Tragic contentions were brought up against the bill, but it finally passed in a modified shape. The following 10 extracts will be read with interest:

At the end of the y'r	Line open miles	Cost of construction (thou. yen)	Passengers No.	Goods tons	Total receipts (thou. yen)	Total expen. (thou. yen)	Net earnings (thou. yen)	Rolling Stock.	
								Engines No.	Cars No.
1875	38	.....	2,754,426	.....	644	403	240	32	349
1880	76	.....	5,315,382	.....	1,555	608	947	36	623
1885	267	17,993	4,538,864	429,877	1,761	839	922	66	1,312
1890	1,267	66,576	22,840,630	1,560,206	7,395	3,552	3,842	254	4,604
1895	2,203	107,945	49,251,577	5,331,412	18,338	7,017	11,320	522	9,334
1900	3,736	276,803	113,710,871	14,401,520	45,059	20,893	24,166	1,279	22,753
1905	4,746	411,559	113,675,403	21,530,064	69,033	32,155	36,877	1,717	32,523

1. Railways to be purchased.—All railways construeted for the purpose of general transportation, except those built for communication in limited localities; the following being the names of those to be purchased: Hokkaido Colliery Railway, Hokkaido Railway, Nippon Railway, Ganyetsu Railway, Hokuyetsu Railway, Kobu Railway, Sobu Railway, Boso Railway, Nanao Railway, Kansai Railway, Sangu Railway, Kioto Railway, Nishinari Railway, Hankaku Railway, Sanyo Railway, Tokushima Railway, Kyushu Railway.

2. Time of acquisition.—From time to time during the period between 1906 and 1915.

3. Prices to be paid.—These shall be calculated on the basis of: (a) a figure representing the average rate of profit as against the amount of money disbursed in construction account during six semi-annual business terms, commencing the second half of 1902 and ending the first half of 1905, is to be first of all obtained by actual calculation. This figure is multiplied by the amount of construction disbursement up to the date of purchase. Twenty times the product so obtained is to form the purchase price; (b) an amount of Government Railway Loan Bonds of such face value as to cover the market value of the goods in stock, excepting the goods purchased and not yet paid for. («Profit» mentioned above designates the surplus of the gross earnings over the business expenditures, bonus to staff, and interest on the accounts other than the profit account. The «average ratio of profit» is obtained by doubling the total profits during the six terms mentioned above, and dividing by the total cost of construction during the same periods.)

4. Terms of Purchase.—The price of the railway shall be paid by the Government within five years after the date of purchase with 5 per cent. loan bonds, at face value. And, in addition, 5 per cent. interest on the price of railways shall be paid from the date of purchase pending the delivery of loan bonds.

5. Companies' loans.—All loans spent for construction account to be excluded from the purchase price and to be replaced with the loan bonds valued according to the market price.

6. Companies' rights and obligations.—All rights and obligations, standing at the date of purchase, to be taken over by the Government, except those of additional business. The rights and obligations between the companies and stockholders, the balance of the capital stock, and also the rights and obligations belonging to the income account, reserves, and the miscellaneous account, to be excluded.

7. Companies' additional business.—If the railway company operates any additional business, the Government may purchase the property belonging to that business with the railways.

8. Capital expenditures.—All expenditures for the capital account, except that incurred by the loans, shall be considered as the expenditures for the construction account and good in stock account, and the outlay of loans must always come after the capital expenditures.

9. The companies not having three years business terms or any dividend.—The terms of purchase of railways of such railway companies shall be decided by mutual agreement between the Government and the companies.

10. The appraisers' decision.—Companies are allowed to appeal against the decision of the Government with regard to the price and the rights and obligations of the railways, and in the event of the appraisers' decision being unacceptable, to appeal to the Minister concerned.

Three months after the promulgation of the Law, a railway bureau, called The Temporary Bureau for the Preparation of Railway Nationalization was created, and at the end of the year 1906 the Government was in possession of six railway companies, with a total mileage of about 1,600 miles, which have cost some 250,000,000 yen. At present, therefore there are in Japan 31 railway companies and 1,675 miles of railway lines.

GROWTH OF JAPANESE RAILWAYS.

Years	Number of passengers	Tonnage of goods	Total earnings	Total expenditures
1872	494,570	.....	174,930	113,464

*Includes Formosa Railway.

Colonial Railways.—The Formosa Railway, which was ceded to Japan in 1895 by the Chinese Government, is now 260 miles in length, extending from Kelung in the north to Takau in the south, and thus, through connection of the two important seaports of the island is satisfactorily effected. The railways in Korea were completed from Fusan as far as the Yale River, with a total mileage of 609 miles while in Manchuria there are also 486 miles of railway under Japanese influence, running from Port Arthur to the city of Kwangchengtsz, which promises a great extension in the future. In 1905, Southern Saghalien was ceded to Japan as the result of the Portsmouth treaty, and there is being built in this new dominion some 27 miles of light railway, extending from Korsakov to Vladimirov.

The above table shows the rapid and substantial growth of Japanese railways from 1872 to 1905.

Tramways and Electricity.—Tramways originated in Japan about nine years later than the ordinary railway, when, in the year 1880, a company named Tokio Basha Tetsudo Kaisha laid in

the metropolis a street tramway for passengers. In 1887-9, tramways, on which carriages were generally drawn by horses, were constructed in various parts of Japan. Consequently, the Tramway Act was promulgated in August 1890, in order to encourage and more effectively control the service in the country. Under this Act, any person or company could be authorized to undertake the building of tramways on the public road, with the consent of the Minister of Civil Affairs. Year by year the number of tramways has been increased, and recently, the advantageousness of electricity as motive power being recognized, the change has been made from horse power to electricity.

TRAMWAYS OPEN FOR TRAFFIC

Year	Motive power	Number of tramway Co.'s	Capital (in thousand yen)		Properties of tramway Co.'s (in thous'nd yen)	Length of tramway lines (in ri)	Number of passengers (in thous)	Business Incomes (thousand yen)	Business Expen. (thousand yen)
			Gross	Paid					
1904	Electric	13	34,024	19,732	39,632	92	85,399	2,968	1,483
	Horse	30	1,827	1,654	2,084	225	6,085	402	389
	Men	10	532	430	636	59	302	100	85
	Total	53	36,384	21,817	42,345	377	91,787	3,471	1,959
1902	Electric	6	3,825	2,665	4,100	42	9,372	443	274
	Horse	25	6,377	4,605	7,574	197	26,169	1,134	759
	Men	10	570	450	637	55	218	80	68
	Total	41	10,772	7,720	12,312	294	35,760	1,658	1,102

THE EMPLOYMENT OF ELECTRICITY (AT THE END OF 1906)

For transacting business		For domestic uses		For official uses		Total	
No. of employers	Horse-power	No. of employers	Horse-power	No. of employers	Horse-power	No. of employers	Horse-power
140	199,019	429	63,660	34	2,349	603	265,028

There can be no doubt as to the great convenience for electric enterprises in such a country as Japan, where there are many rapids and waterfalls to supply an abundance of electric power, and electric railway enterprises are now flourishing in almost all the provinces of Japan.

Roads and Bridges.—On account of the singular policy of the Tokugawa Shogunates and the feudal nobles, the public highways in Japan were long neglected. After the Restoration, however, the Imperial Government was eager to repair or construct roads and bridges. Thus, at the time of the latest survey of 1902, there were in Japan over 22,900 miles of road suitable for carts, and more than 227,000 miles of village pathways. Roads are now divided into three classes: National highways, Provincial Highways, and Village Pathways. The two former classes are generally maintained by provinces; the last by villages.

At the early part of the Meiji era, there were only a few wooden bridges, but gradually they have been increased in number, and their structure has been much improved. At the end of the year 1902, Japan possessed 80 iron bridges, over 49,000 stone bridges, and more than 210,000 of other construction.

His Excellency, Isaburo Yamagata,
Minister of Communications, Tokyo.

16. Japan—Banking System. The progress of the banking system in Japan commenced at the enactment of the National Bank Regulations in 1872. The progress was rapid, and at present, 35 years after the enactment, Japan possesses a complete system of ordinary and savings banks; special banks to minister to the development of foreign exchange, agriculture, commerce and industry; clearing houses, and the different associations, information bureaus, brokerage houses, trust companies, etc., to assist the work of the banks.

Even before the Restoration in 1868, there had been in Japan institutions conducting the work of banks. They received deposits, made loans, issued exchange and commercial bills, and conducted exchequer business for feudal lords and shoguns, thus promoting the economic progress of the country. After the Restoration, establishments called exchange companies were organized, at the instance of the government, at several commercial centres. They also conducted a general banking business and issued gold and silver notes. The constitution of these establishments was, however, not perfect enough to entitle them to the name of banks according to the modern understanding. The banking corporation worthy of the name did not exist in Japan until the national banks were established.

After the Restoration in 1868, the Government sent a deputation to inspect the banking system of foreign countries, for the purpose not only of promoting the financial and industrial prosperity of Japan, but of consolidating the Government paper money, which had been issued to an enormous amount. As the result of this inspection tour, the Government promulgated, in November 1872, the National Bank Regulations, drawn up after the model of the American system. According to the Regulations, the National Banks had to pay six-tenths of their capital to the Government in the Gov-

ernment paper money; to receive in exchange the same amount of public loan bonds; to deposit the bonds with the Government and get permission to issue the same amount of bank notes convertible to gold. The First and three other national banks were established in accordance with the Regulations. At the time, however, the Government had to issue inconvertible notes to meet national expenditure, and the result was that there was a difference in value between paper and hard money. Bank notes issued by the banks were returned to the banks instantly, placing them in serious difficulties. About this time the Government gave public loan bonds to the nobility and samurai class to compensate for the loss of their income. In order to increase the utility of these bonds on the one hand and to relieve the banks of their difficulties on the other, the Government encouraged the organization of new banks, and in 1876 made an amendment to the National Bank Regulations. According to the new Regulations, the amount of notes to be issued by the banks was increased to eight-tenths of their capital. The banks had to deposit the same amount of public loan bonds with the Government as security for their bank notes, which were made convertible with coin. As the result of this amendment, the bank notes heretofore convertible to gold became inconvertible, and the banks were able to get more profits than before. This gave an impetus to the organization of banks, the number of which reached 153 at one time.

Moreover, the Government issued a large amount of paper notes in order to meet the expenses relating to the Satsuma rebellion of 1877, with the result that the amount of inconvertible bank notes greatly increased and their value decreased as compared with hard money.

In order to improve the situation, the Government, after 1877, endeavored to discourage the organization of national banks and to decrease the amount of notes. In 1880, it had the Yokohama Specie Bank established as an organ of foreign exchange and of promoting the importation of specie. In 1882, the Bank of Japan was established after the style of the Central Banks in European states. In the next year, the National Bank Regulations were again amended, prohibiting the existence of national banks on the expiration of their respective terms of business. The privilege to issue notes was taken back from those banks and given to the Bank of Japan. By this amendment, the principle of the unification of paper currency was established, and the national banks, hitherto exercising great influence in the money market, were, one by one, converted into private banks, and in 1899 the national banks had ceased to exist.

The progress of private banks was steady after the Restoration, and their number reached 954 in 1884. At the time, however, the national banks still exercised great power in the money market, and as there was little necessity for the Central Government to exercise strict supervision over other banks, the latter were relegated to the control of local governments. Subsequently, the national banks were converted into private banks, due to the amendment of the National Bank Regulations, as already mentioned, and independent of this, there was a tendency for the steady increase of the number of private banks. To cope with the situation, the Government, in 1890, promulgated the Banking Regulations and the Savings Bank Regulations. These laws were not put in force till 1893, to which date the operation of the Commercial Code was postponed.

These laws constituted almost a perfect system of legislation relating to banks, except with regard to the function of making loans of a long term for agriculture and industry. In order to make good this defect, the Government, in 1896, issued the Law of the Hypothec Bank of Japan and Law of the Farmers' and Mechanics' Banks. The former bank was then established in Tokyo and the latter in Tokyo and in each of the other 45 prefectures.

In 1895, Japan came into possession of Formosa, and in order to improve the monetary conditions in that island, the Government, in 1897, promulgated the Law of the Bank of Formosa. The bank was established in 1899 and conducted the issue of convertible notes and general banking business.

As there was no financial organ for the colonization of Hokkaido, the Government enacted in 1899 the Laws of the Colonial Bank of Hokkaido, and the bank was established in the following year.

Meanwhile the number of various industrial companies in Japan kept increasing, and the amount of shares and debentures issued by these companies reached huge figures. In spite of this fact, Japan had few banks which could make sufficient loans on these shares and debentures. This circumstance being considered detrimental to the progress of the nation's industry, the Government, in 1900, promulgated the Law of the Industrial Bank of Japan, and a bank on the basis of this law was established in 1902.

In view of the increasing number of Japanese banks carrying on their business in foreign countries, the Government, in 1905, promulgated a law for the control of such banks, providing that Imperial Ordinances may be issued for the said control according to the conditions prevailing in the country where the banks are engaged in business. In the same year, an Imperial Ordinance was issued in relation to the Dai-ichi Ginko, Ltd., carrying on its business in Korea. By the ordinance, the bank is authorized to issue bank notes in Korea.

The Yokohama Specie Bank obtained the right to issue bank notes in foreign countries in 1901, and has been exercising that right in China. In 1906 an Imperial Ordinance was issued to control the issue of business of the Yokohama Specie Bank.

SPECIAL BANKS.

1. *The Bank of Japan.*—The Bank of Japan is the central bank of the Empire, established in accordance with the Law of the Bank of Japan. In May 1907, it had a registered capital amounting to 30,000,000 yen, fully paid up, and possessed reserves amounting to 20,750,000 yen. Its business consists of discounting or purchasing public loan bonds and commercial

bills, purchase and sale of gold and silver bullion, making loans on security of gold or silver or of bonds guaranteed by the Government, collection of bills, receiving deposits for safety, and making cash accounts for the State treasury.

The bank has the privilege to issue bank notes convertible to gold coins. In principle the bank has to keep the same amount of gold and silver as conversion fund. But at the same time, it is allowed to substitute the specie reserve with sound bonds to the extent of 120,000,000 yen. In the event of the money market demanding a large amount of currency, the bank, subject to permission by the Government, may issue notes in excess over the legal limit. The excess issue must be, of course, backed by security reserves. In this case, a tax of not less than 5 per cent. per annum is imposed on the amount issued over the legal limit. At the end of May 1907, the amount of convertible notes issued stood at 294,202,480 yen, of which the sum of 139,681,012 yen was backed by specie reserve.

The Government exercises the most strict supervision over the bank, being represented by standing inspectors. The governor and vice-governor of the bank are appointed by the Government, and the bank cannot change its regulations (company contract) and take important measures without permission or sanction of the Minister of Finance.

2. *The Yokohama Specie Bank.*—The Yokohama Specie Bank was established in accordance with the Law of the Yokohama Specie Bank, and its principal object is to conduct foreign exchange business. In May 1907, it had a registered capital amounting to 24,000,000 yen, fully paid up, and reserves amounting to 14,784,861 yen. It has branch offices not only in many places in Japan and Kwantung Province, Manchuria, but in London, Lyons, New York, San Francisco, Hawaii, Bombay, Hongkong, and various points in China. The offices in Kwantung Province and China are allowed by the Government to issue notes convertible to silver, against the reserves of the same amount. The kind of the reserves are ordered by the Government. At present, the bank is ordered to keep specie reserves against more than half of the issue amount, and security reserves for the remainder. The Government supervision over the bank is exercised by permanent inspectors, and the appointment of directors, elected at a general meeting of shareholders, is valid only after being sanctioned by the Minister of Finance. On the whole, the bank is supervised by the Government in the same manner as is the Bank of Japan.

3. *The Hypothec Bank of Japan.*—The object of this bank is to promote the improvement and progress of agriculture and industry, and it mostly makes loans on immovable property. In May 1907, it had a registered capital of 10,000,000 yen, paid up to the extent of 3,250,000 yen, and reserves amounting to 1,372,309 yen. In business, it makes loans to be repaid in annual installments covering not more than 50 years, usually on security of immovable property. It may also make fixed loans on immovable property, for a term of not more than five years. Such loans, however, shall not exceed one-tenth of the total amount of loans made for yearly installments. The bank may also make loans without security to public or other sound corporations.

As a means to obtain funds, the bank is allowed to issue debentures up to an amount ten times as large as the sum of its fixed deposits and paid-up capital. As a means of advancing money to the Farmers' and Mechanics' banks, it may take up debentures issued by those banks, make loans on security of right of claim of those banks due to their loans, and appoint those banks to be its agents and make loans on their standing as security. The Government supervises this bank generally in the same manner as it supervises the Bank of Japan.

4. *The Farmers' and Mechanics' Bank.*—This bank has been established in each prefecture, in accordance with the Law of the Farmers' and Mechanics' Banks. It has the same object of business as the Hypothec Bank of Japan, only on a smaller scale. In May 1907, the number of the Farmers' and Mechanics' banks in Japan was 46, having a total registered capital of 28,820,000 yen (28,494,860 yen paid up), and reserves amounting to 4,221,199 yen. Its line of business is, on the whole, the same as that of the Hypothec Bank of Japan. But they are different in that the Farmers' and Mechanics' Bank is allowed to make loans repayable in yearly installments extending over only 30 years, and that the maximum of debentures to be issued is only five times of its paid-up capital. The Government supervision over the bank is similar to that over the Hypothec Bank, except that in this bank the appointment of directors is solely entrusted to election by a general meeting of shareholders.

5. *The Bank of Formosa.*—This is a colonial bank especially organized for the exploitation of Formosa. In May 1907, it had a registered capital amounting to 5,000,000 yen (3,750,000 yen paid up), and reserves amounting to 725,000 yen. It engages in a general banking business and owns the privilege to issue bank notes convertible into gold coin. The issue is conducted in a manner generally similar to that of the Bank of Japan, but the amount of issue is limited to not more than 5,000,000 yen. The method and degree of the Government supervision over this bank is on the whole similar to that over the Bank of Japan.

6. *The Hokkaido Colonial Bank.*—The object of this bank is to supply funds for the work of colonization of Hokkaido. In May 1907, it had a capital amounting to 5,000,000 yen (3,500,000 yen paid up), and reserves amounting to 63,336 yen. Its business consists essentially of making loans for long terms on security of immovable property. It is also allowed to make loans on security of local produce and of shares and debentures; discount bills, take up debentures of the companies whose object is to colonize the island, engage in exchange business and receive deposits fixed or on current account. The bank may issue debentures to the extent of five times its paid-up capital. The Government supervision is conducted in a similar manner to that over the Farmers' and Mechanics' banks.

7. The Industrial Bank of Japan.—This bank can be aptly called a bank of movable property. In May 1907, it had a registered capital amounting to 17,500,000 (17,000,000 yen paid up), and reserves amounting to 512,800 yen. Its business consists in subscribing or taking up public and local loan bonds and debentures, making loans on security of these bonds or shares, or of corporations established in accordance with laws relating to mines, factories and railways; in receiving deposits, safe-keeping and trust business relating to mortgage debentures, etc. The bank can issue debentures aggregating not more than ten times its paid-up capital. The method and extent of the Government supervision over this bank are similar to that over the Hypothec Bank of Japan.

8. *The Dai-Ichi Ginko, Ltd.*—In May 1907, this bank had a registered capital amounting to 10,000,000 yen (7,000,000 yen paid up), and reserves amounting to 2,950,000 yen. In Japan it carries on a general banking business in accordance with the Banking Law. In Korea it deals with public money of Korea and issues notes convertible into Korean currency in accordance with special laws. In connection with the issue business security reserves should not be more than 10,000,000 yen. The specie reserve may include the Bank of Japan notes. In case an issue in excess over the legal limit is necessary this may be done subject to conditions dictated by the Government. The Government supervision over this bank is similar to that over ordinary banks as regards its business at home, but special supervision is exercised over its business in Korea.

ORDINARY BANKS.

By ordinary banks is meant those banks which engage in a general banking business in accordance with the Banking Regulation. Of all banks, these are under the most lenient supervision by the Government.

Those who desire to engage in ordinary banking business, must obtain the sanction of the Minister of Finance. The amount of the capital of an ordinary bank was formerly without any limitation; but since 1901, all banks have been ordered to possess a capital amounting to 50,000 yen at least. The classification, number, and amount of capital of ordinary banks existing in Japan at the end of May, 1907, were as follows:

Kinds of Banks.	Number.	Registered Capital, Yen.
Kabushiki Kaisha	1,465	349,474,475
Gomei Kaisha	68	20,367,850
Goshi Kaisha	105	19,741,474
Kabushi Goshi Kaisha	2	652,000
Individuals	82	5,371,520
Total	1,722	395,607,319

According to investigations made at the end of 1906, paid-up capital totalled 256,523,748 yen and reserves 68,180,543 yen. Of the Kabushiki Kaisha (joint stock companies, ltd.), 198 banks are engaged in the savings bank business.

SAVINGS BANKS.

The Savings Banks receive deposits at the rate of compound interest, and are subject to Government supervision more strict than given to ordinary banks, in the following points: (1) They must be organized as joint stock companies, ltd. (2) They must not amend their company contract without the sanction of the Government. (3) Directors must be under unlimited liabilities. (4) They must reserve one-fourth of savings deposits in the shape of public loan bonds or other sound securities and deposit them with the Government as security for depositors. At first there were restrictions with regard to the sort of investment to be made by the savings banks. But these restrictions were removed in 1895, and instead the four provisions above enumerated were instituted. As a result of the measure, the savings banks now invest their money in a similar way as ordinary banks. The number and amount of registered capital of savings banks at the end of 1906 were 460 and 81,508,450 yen, respectively. According to investigation under the same date, the paid-up capital aggregated 42,811,827 yen and reserves 9,824,390 yen. In addition to these, 198 ordinary banks carry on savings bank business.

CLEARING HOUSES.

Clearing Houses.—The Clearing House in Japan was first established in Osaka in 1879 after the model of similar institutions in Europe and America. Subsequently, it was organized in Tokyo and other places, there being at present six clearing houses in Japan. The one in Tokyo has the following regulations, and those in other places have on the whole similar regulations: (1) Members are limited to those banks which are members of the Tokyo Bankers' Association and which have current account connections with the Bank of Japan. (2) New membership shall be awarded with approval of more than three-fourths of the total number of members, to be decided by open ballot. (3) Members shall deposit security money with the House, and in the event of their failing to repay their debts in the clearance of bills, the account will be settled with the security money. In that case, the defaulter loses his membership. (4) Members may represent non-member banks in clearing bills, provided that a majority of the members approve of the representation. (5) In the case of the above clause, the representing bank shall demand a money security from the represented bank, and use that money for settling accounts in case the latter fails to repay debts due to clearing its bills. In that case the Clearing House shall refuse to entertain the representation of that particular bank. (6) In the event of the payer of bills cleared failing to pay, the name of that payer shall be made public. (7) The Clearing House accounts of members are settled by current account at the Bank of Japan. Number and value of bills cleared at different clearing houses in Japan in 1906 were as follows:

Clearing Houses.	Number of Bills.	Valuation, Yen.
Tokyo	3,101,809	3,500,858,675
Osaka	2,123,266	1,463,860,195
Kyoto	588,067	263,137,614
Yokohama	379,186	912,893,403
Kobe	418,934	713,928,495
Nagoya	331,223	269,381,779
Total	6,942,485	7,124,059,761

YOSHIRO SAKATANI,
Minister of Finance, Japan.

17. Japan—The Japanese Army. In 1868, the first year of Meiji, the Imperial Japanese Government was formed under the present Emperor. It had seven departments, one of which was that of the Navy and Army. While the name of the department has been changed several times, naval and military officers have always formed one branch of the administration. In the year 1868, this department of the Navy and Army had come into the possession of the bureaus of the navy, army, construction, warships, ordnance, horse administration, military school, and military administration. Next year it had the addition of the bureaus of account and courts-martial.

In 1871 military stations were established in Tokyo, Tohoku, Osaka, and Chinzei. At the same time took place the organization of the general staff bureau, naval school, shipbuilding office, and other naval offices.

In 1872 the War Office was separated from the Navy Department and made an independent department. Two years later the number of military stations was increased from four to six and established at Tokyo, Sendai, Nagoya, Osaka, Hiroshima, and Kumamoto. At the time, however, the General Staff still formed a bureau of the War Office.

In 1875 military arsenals were established in Tokyo and Osaka. In 1876 the Artillery Council was organized. In 1878 the General Staff Office was separated from the War Office, there being added the hydrographic and kindred offices, compilation, translation, and survey, together with a library. Two years afterwards a telegraph section was added to the General Staff Office.

In 1881 gendarmerie headquarters were established in Tokyo. In the following year a military staff college was established under the direction of the General Staff Office. In 1883 an Engineering Council was organized.

In 1886 a thorough reorganization of the War Office took place. It now consisted of the Minister's secretariats and bureaus of general affairs, cavalry, artillery, engineering, account, and medical affairs. Towards the end of that year a special fortification department was organized.

In 1888 the military stations were converted into Division Headquarters. At this time, the War Office established the woolen factory now existing at Senju. In 1890 the Imperial Bodyguard Headquarters were organized.

During 1895 there existed, as an outcome of the Chino-Japanese war, a special quarantine department. In June, offices having charge of the construction of telegraphs and lighthouses in Formosa were established and a military office was organized under the direction of the governor-general of Formosa.

In 1896 the number of army divisions in Japan was increased from six to twelve, and Totoku-fu (offices of General Superintendence) were created for the eastern, central, and western sections of Japan.

In 1898 the Gensui-fu (Council of Field-marshals and Fleet Admirals) and the Headquarters of Military Education were organized.

The War Office was reorganized in 1900, with new bureaus, viz., those of general affairs, personnel, military affairs, supply, and justice. The Military Supply Depot was established in 1902.

In 1903 the Artillery and Engineering Councils were abolished. Branches of the Supply Depot were established at Ujina and Osaka. On 28 December of that year the Regulations of the Imperial Military Headquarters in Time of War and of the Military Council were amended.

On 13 Jan. 1904, the Totoku-fu were abolished. On 21 February, shortly after the outbreak of the late war, a bureau of information relating to prisoners of war was established in Tokyo. On 24 April the Tokyo Garrison Headquarters were newly organized. On 23 June, a special military quarantine office was established in Tokyo, and quarantine stations were opened at Ni-no-shima and Dairi in November.

In 1905 a special military Central Exchequer was organized. Shortly after the opening of the war depots for the Russian prisoners of war were established at Matsuyama, Himeji, Fukuchiyama, Shizuoka, Hamadera, Navashino, and other places, the total number of such depots being 29. A military quarantine station was newly established at Wada Point, Kobe, in September.

On 31 July 1906, the Regulations of the Military Department of the Government-General of Kwantung and of the Headquarters of the Military Forces in Korea were enacted. On 6 August, the Regulations of the Homes for Crippled Soldiers were enacted. For the time being one home is established in Tokyo.

NUMBER OF OFFICERS ABOVE THE RANK OF SUB-OFFICER, IN TIME OF PEACE.

(Present on 31 December, each year.)

Years	Active Service.	1st Reserve.	2d Reserve.	Total.
1899	7,994	1,931	994	10,919
1900	8,608	2,400	1,165	12,173
1901	9,093	3,118	1,435	13,646
1902	9,612	3,798	1,709	15,119
1903	10,069	4,243	2,011	16,323

DETAIL FOR 1903.

	Active Service.	1st Reserve.	2d Reserve.	Total.
General	116	30	21	167
Gendarmerie	112	45	42	199
Infantry	4,853	2,069	1,209	8,131
Cavalry	541	126	39	706
Artillery	1,820	335	143	2,298
Sappers	491	124	67	682
Commissariats	288	105	37	430
Comptrollers	717	602	184	1,503
Surgeons	966	706	240	1,912
Veterinaries	158	101	29	288
Band Corps	7	...	...	7
Total	10,069	4,243	2,011	16,323

Military Supply System.—Clothing.—Offices for supplying clothing for the army are controlled by the clothing and provisions section in the Comptroller's Bureau of the War Office. There is also the clothing depot, being a central executive organ. Cloth is manufactured at the Senju woolen factory, belonging to the army. The War Office gives clothing materials and money every year to the army, officers, and schools, and causes them to regulate the supply among themselves. With the material and money, clothes are made for non-commissioned officers, soldiers, and students.

Provisions and Fodder.—The clothing and provisions section of the Comptroller's Bureau of the War Office controls affairs relating to the supply of provisions and fodder to the army. There exists also the provisions and fodder depot as a central executive organ. Provisions and fodder required by the army are procured by the Division Comptrollers' Departments, and those for other official establishments and schools by their respective directors. Military bodies are given fixed amounts of provisions and fodder and of money, as also are schools with dormitories, and are allowed to manage their own supply business. The food is supplied after cooking by the military bodies and schools. The supply of fodder is managed in a similar way.

Factories.—Military Arsenal.—The military arsenal engages in the manufacture and repair of arms required by the army and ammunition required by the navy. It is governed by the military inspector of arms.

There are military arsenals in Tokyo and Osaka. The Tokyo arsenal manufactures rifles, cartridges, and gun-equipment, and governs gunpowder manufactories at Meguro, Itabashi and Iwahana, all near to Tokyo. The Osaka arsenal makes guns, gun-carriages, shot, and accessories, and governs the Ujina gunpowder manufactory and the Moji manufactory of arms. Branches of the arsenals, when deemed necessary, are established at the places where the branch arms depots exist. The Artillery and Engineering School belongs to the Tokyo Military Arsenal.

Senju Woolen Factory.—This factory manufactures cloth required by the army and is governed by the Minister of War. It is managed as a special account.

Clothing Depot.—This depot procures cloth mainly from the Senju woolen factory and makes it into military clothes. The depot also procures sundry goods and cloth from the public and supplies the army.

Provisions and Fodder Depot.—This depot conducts the business relating to provisions and fodder to be used in time of war. The examination of such provisions and fodder is conducted here.

Horse Administration.—The history of the supply of horses to the Japanese Army can be divided into three periods. In the first period (1868-1872) grown horses were acquired from the public and supplied to the army; in the second period (1873-1880) grown horses were purchased from the public and supplied to the army after they had been trained; and in the third period (1881 to the present) young horses have been procured and supplied as military horses after being reared as such. The army has a military horse supply department, under the direction of the Minister of War. This department engages in the purchase, training, supply, and investigation of supply resources of military horses. The department has a head office at Tokyo and seven branch offices in different centres of horse-breeding in Japan. The purchase of horses is conducted by purchase officers who are dispatched from Tokyo to Hokkaido, Akita, Aomori, Iwate, Miyagi, Fukushima, Tochigi, Kagoshima, and other prefectures every year, in the spring and autumn. In order to maintain these horses, all branch offices of the Horse Supply Department have their own pastures, to the extent of about 143,000 acres.

Supply of Personnel.—Officers.—In the early stage of the army, as organized after the Restoration of the Imperial Régime, military officers were appointed from among the officers in the military forces of different clans and from among the people in general. The method of obtaining military officers underwent many changes before the present system was organized. At present officers of infantry, cavalry, artillery, sappers, and commissariat troops are selected from among the following classes after the necessary education with the colors and at the Military College: (1) Graduates from the Central Military Preparatory School. (2) Graduates from a Middle School or from a school of an equal or higher grade, who have passed an examination for the service. (3) One-year volunteers bearing testimonial of the commander of their corps, and who have passed an examination for the service. (4) Non-commissioned officers of all arms in active service, who are of good behavior and recommendable character, who bear testimonials of the commander of their corps, and who have passed an examination for the service. (Graduates from the Central Military Preparatory School are those who have received three years' education at a local military preparatory school and one year and nine months' education at the Central Military Preparatory School. Students of the local military preparatory schools are selected from among boys of 13 to 15 years of age who aspire to be military officers.)

Officers of the Military Comptrollers' Department are obtained from the following classes, after the necessary education with an infantry corps and at the Military Comptrollers' School: (1) Graduates from a middle school, or from a school of an equal or higher grade, who have passed an examination for the service. (2) One-year volunteers who bear testimonials of the commander of their corps and who have passed an examination for the service. (3) Non-commissioned officers in the comptrollers' department in active service, who are of good behavior and recommendable character, who bear testimonials of the commander of their corps and who have passed an examination for the service.

Officers in the hygienic department are obtained from the following classes, after the necessary training with an infantry corps and at a military hospital. (1) Graduates from the Medical College of the Imperial Universities, from the Special Medical Schools, or from the Prefectural Medical Schools with the recognition of the Minister of Education as of an equal or higher grade than middle school, who have applied for the military service and who have been educated at those schools at the request of the army. (2) Graduates from the above schools, or those who have acquired equal qualifications at foreign schools, who apply for service. (3) Graduates from the Military Surgeons' School. (4) Those one-year volunteers who bear a license as medical practitioners or pharmaceutists, and who apply for service.

(The Military Surgeons' School admits by selection the owners of the license as medical practitioners or pharmaceutists, who are between 20 and 30 years of age and who apply for service.)

Officers of the veterinary department are obtained from among the following classes, after the necessary education with a mounted corps: (1) Graduates from the veterinary departments of the College of Agriculture of the Imperial University or of the Government Special Industrial School (Jitsugyo Gemmon Gakko), who have applied for service and were educated at those schools at the request of the army. (2) Graduates from the above schools, or those who have obtained equal qualifications at a foreign school, who apply for service. (3) One-year volunteers who possess the license of veterinary surgeon, and who apply for service.

Officers of military bands are promoted from among those who have served in the military band for three years or more and whose merits are recognized.

Non-commissioned Officers.—In the early stage of the modern Japanese army, non-commissioned officers were recruited in the same manner as officers. Under the present system, non-commissioned officers of gendarmerie are recruited as follows: (1) First-class privates of gendarmerie in active service who have been in the gendarmerie service for more than two years and whose behavior is good and character recommendable. (2) Non-commissioned officers of infantry, cavalry, artillery, sappers, and commissariat troops (excepting various artisan corps), who have been in active service for more than six years after joining the colors, who are of good behavior and of recommendable character; who have applied for admission into the gendarmerie department, and have passed the necessary examination and who still have a margin of age for active service to the extent of more than one year. (3) Gendarmerie corporals or sergeants in reserve, who are of good behavior and recommendable character and who apply for active service within one year after the expiration of their term for active service. (4) Reserve corporal or sergeant of infantry, cavalry, artillery, sappers, or commissariat troops, who have been in active service for more than six years, who are of good behavior and recommendable character, and who, applying for the position of non-commissioned officer of gendarmerie, have passed an examination for the service.

Reserves of non-commissioned officers of infantry, cavalry, artillery, sappers, and commissariat troops are as follows: (1) Soldiers of all arms in active service who apply for renewed service as non-commissioned officers, and those troops in the Tsushima Garrison who apply for permission to be with the colors until their term for active service expires and who are fit for such service. (2) Reserve first-class privates who while with the colors have discharged the duties of corporal and who apply for the position of non-commissioned officer within one year after the expiration of their term for active service. (3) Reserve first-class privates, who possess a certificate showing capability to discharge the duties of a non-commissioned officer and who apply for such position in less than one year after the expiration of term for active service. (4) Reserve sergeants or corporals who apply for active service in less than one year after the expiration of their term for active service.

Non-commissioned officers of artillery are obtained from among those persons who are not in the reserve of the navy or army, or first year privates of all arms, who have passed an examination for the service and gone through the necessary education at the artillery and engineering school.

Non-commissioned officers of horseshoe-makers are drafted from horseshoe-makers in the second or third years of active service in cavalry, artillery or commissariat troops, who apply for renewed service and who are fit. They are then given nine months' education at the veterinary school, in order to become chief horseshoe-makers.

Non-commissioned officers in the hygienic department are obtained from the following groups of men: (1) Ambulance hands or soldiers of any arm in active service, who apply for renewed service as non-commissioned officers in the hygienic department, or men in the Tsushima garrison who desire to remain with the colors until the expiration of their term of active service, and who are fit for the position of non-commissioned officers. (2) Ambulance men in reserve, who while in active service have been chief nurses, and who apply for the position of non-commissioned officers in active service in less than one year after the expiration of their term of active service. (3) Ambulance men in reserve who possess a certificate qualifying them for the position of non-commissioned officers and who apply for active service within one year after the expiration of their term for active service. (4) Second and third class chief nurses in reserve who apply to enter active service within one year after the expiration of their term for active service.

Non-commissioned officers in the comptrollers' department are taken from the following: (1) Non-commissioned officers attached to corps of all arms who apply to be such officers in the comptrollers' department, and first-class privates who have been in active service for two years or more after joining the colors and who have applied for renewed service as non-commissioned officers in the comptrollers' department and obtained the necessary knowledge for such position. (2) Reserve first-class privates of all arms, who while in the active service have acted as accountants, and who apply for the position of non-commissioned officer in active service within one year after the expiration of their term of active service. (3) Reserve non-commissioned officers or first-class privates of all arms who possess a certificate showing their fitness to be non-commissioned officers in the comptrollers' department, and who apply for such position in active service within one year after the expiration of their term for active service. (4) Second or third class accountants in reserve, who apply to enter active service within one year after the expiration of their term of active service.

Non-commissioned officers in military bands

are drafted from bandsmen who have been in active service for more than two years and who are sufficiently accomplished to be non-commissioned officers.

Privates.—In the early period of the Meiji Era, soldiers were recruited from all clans according to the amount of revenue of their lord. In 1873 the Conscription Law was promulgated, and all men in the country were entered in the army list on their reaching the age of twenty. This laid the foundation of the present Japanese Army. The law was amended several times, but its spirit remained the same. The present system provides: (1) All Japanese male subjects between 17 and 40 years of age are responsible for military service. (2) The army is classified into regulars, second-reserves, recruits, and national army. (3) The regular service is divided into active and first reserve services. The active service is for three years beginning with the 20th year of age. The first reserve service is for four years and four months, for those who have finished the active service. (4) The second reserve service is for 10 years, and enlists those who have finished the regular service. (5) Recruit service is for 12 years and four months and enlists a required number of the surplus men over the required number of regulars each year. (6) The national army service is divided into first and second national army services. The first national army includes the second reserves and trained recruits who have finished their term of service. The second national army is constituted by those who are enlisted in neither of the above services.

Men are drafted independent of the Conscription Law as follows: (1) First-class privates of gendarmerie are obtained from among soldiers of other branches of the army by their application. (2) Bandsmen are obtained from graduates from the Military Bandsmen's School. The total of men at the conscription age in 1902 was 512,801. They are classified according to the Conscription Law as follows:

Classification.	No. of Men.	Per-centage.
Conscripts—Enlisted in active service: 1st recruits; 2d recruits	194,495	37.93
Conscription postponed	79,348	15.45
Freed from conscription	186,971	36.66
Freed from military service	34,218	6.67
Others	17 769	3.46
Total	512,801	

Military Education.—Military education in Japan is given in the following schools: (1) Military Staff College; three years' course, admits about 50 students a year. (2) Military College of Artillery and Engineering; three years' course, admits 120 students a year. (3) Military College; 18 months' course, admits 450 students a year. This is a cadets' school. (4) Military Toyama Schools; soldiers are taught tactics, shooting, fencing, and gymnastics, in a two to seven months' course; number of students varies from year to year. (5) Central Military Preparatory School; two years' course, admits 300 students a year. (6) Local Military Preparatory Schools; exist in Sendai, Nagoya, Osaka, Hiroshima, and Kumamoto; three years' course, admits 50 students a year. (7) Military Cavalry Practice School; 11 months' course to be given to cavalrymen; number of students varies. (8) Military Field Artillery Practice School; two and three months' course, number of students varies. (9) Military Siege Artillery Practice School; course two months to one year. (10) Telegraph Educational Battalion; courses, one year and 18 months. (11) Military Comptrollers' School; accountant cadets and accountant officers are taught here; the course for the former is one year nine months, and that for the latter one year. (12) Military Surgeons' School; course for officers covers four months at the most and that for cadets one year. (13) Military Veterinary School; course three to nine months. (14) Military Artillery and Engineering School; trains non-commissioned officers; courses, one and two years. (15) Military Bandsmen's School; attached to the Toyama School and trains bandsmen.

Court Martial.—In 1871, when the military stations were established and regular troops enlisted for the first time in Japan, a naval and military criminal code was enacted. In the following year the War Office was established and a military law court came into existence. The present military penal code was promulgated in 1883 and amended in 1888.

In the Japanese military law court or court-martial, the provisions not only of the military penal code but of the ordinary Criminal Law and other penal regulations are applied.

There exist two sorts of courts-martial; one is the Higher Court-martial, and the other is the Division Court-martial, the latter existing in each division. The Higher Court-martial exists in Tokyo and delivers judgment in offences committed by generals, and conducts the re-examination of cases examined by the Division Court-martial. Trial by courts-martial is not open to the public. Neither debate nor prosecution is allowed. Counsel and appeal are prohibited.

Military justice is conducted by procurators, secretaries, and judges, and presided over by the Minister of War in the case of the Higher Court-martial, and by the Commander of Division in the case of Division Court-martial. Secretaries are civil officials and execute duties resembling those of preliminary judge in the ordinary law courts. Judgment is given by five judges, all of whom are military officers. Secretaries may participate in trial but have no voice in making decision. Procurators are also outside the court-martial, strictly speaking. Judgment becomes valid by sanction by the Commander of Division or of the Emperor, according to the official status of the offender.

Besides those above mentioned, courts-martial are established in Formosa, and in field armies and forts in time of war. They are similarly constituted on the whole as the Division Court-martial. With the progress of the military organization and general litigation system in Japan, the courts-martial will be gradually improved.

Military Prisons.—The organization of military prisons was enacted in 1876 for the first time. It was amended several times, the latest amendment taking place in 1894. Military prisons exist in those places where exists a court-martial, and are governed by the officers who

preside over the court-martial. The staff of a military prison consists of a director, clerks, chief jailor, and jailors. In military prisons are imprisoned small offenders who are in active service or military officials still retaining their official positions, and defendants in criminal cases. The prison building is divided into three sections, rooms for defendants, cells for convicts, and detention house. The military prison is so conducted as to execute penalties in a most appropriate way against military offenders, that is with a view to the maintenance of the military spirit and discipline.

Sanitation.—In 1868, the first year of Meiji, a naval and military department was established in the Imperial Government, and in October, the same year, a soldiers' provisionary hospital was founded in Tokyo. This forms the beginning of the hospital system of the Japanese Army. In February 1870, another military hospital was established in Osaka. At the time military surgeons were engaged in the treatment of patients as well as in teaching subordinate physicians. These hospitals gave medicine not only to soldiers, but to the general public. In 1871 a Bureau of Naval and Military Surgeons was organized in the War Office, and was ordered to control all affairs relating to medicine for the army in the whole empire. At the same time regulations relating to the organization of military hospitals were published. The bureau of surgeons, above mentioned, was placed under the direction of a surgeon of the rank of major-general. In those days surgeons were appointed by periodical examination from among ordinary physicians.

In 1872, military hospitals were established at each military station. The organization of the hygienic administration in the army underwent various modifications afterwards. The present regulations of military hospitals were promulgated in February 1898.

According to the present system, military hospitals exist at all places where is stationed a military garrison. These hospitals not only give medical treatment to soldiers, but engage in storing and supplying medicines and medical instruments and in teaching non-commissioned officers and men of the hygienic department. According to their size and importance, the hospitals are divided into five classes. These hospitals are so constructed as to be able to take in as patients about 3.5 per cent. of the total troops stationed at the place where the hospital exists.

The personnel of the hospital includes a director, surgeons, pharmaceutists, accountants, chief nurse, and nurses. The director of a military hospital is appointed from among surgeons of the rank of captain to colonel, inclusive. He is controlled by the chief surgeon of the division to which he belongs in the execution of his medical duties.

Veterinary Department.—At the beginning of the modern Japanese Army, veterinary affairs were conducted by the Bureau of Surgeons, and a regulation for providing cavalry, artillery, and other corps requiring horses, with veterinaries, was enacted. At the time veterinaries were drafted from the general public. In 1873, an independent department of veterinaries was established, and the rank of veterinary officers fixed. In the following year, non-commissioned officers and men of the veterinary department were appointed. At first these non-commissioned officers and men were taken from graduates from the military veterinary school. But subsequently this school was ordered to devote itself to the supply of officers, and men of lower ranks were taken from among conscripts. At present this school gives training to horse-shoe-makers. The course in the school for officers is about five months, that for non-commissioned officers three months, and that for candidates for non-commissioned officers nine months.

M. Terauchi,
Minister of War, Tokyo.

18. Japan—The Navy. Naval affairs had been fairly well developed in Japan until the isolation policy of the Tokugawa Shogunate in 1635 prohibited the building of ocean-going vessels under pain of capital punishment.

A few ancient naval undertakings which are noteworthy in Japanese history are: The expedition of the Empress Jingo to Sankan (ancient Korea) in 200 A.D.; the fighting in the Inland Sea of Japan between the clans Gen and Hei in 1186; the Chinese attempt to invade Japan and the arrival of Kublai's armada on the coast of Kiushu and the annihilation of it in 1280; the encounters between the Japanese and Korean fleets on the southern coast of Korea on the occasion of Taiko's (Hideyoshi's) invasion of that peninsula in 1592-1598. In the beginning of the 17th century the predatory visit of Japanese pirate junks to the coast of South China is notable and it was about that time also that Japanese junks sailed, for commercial purpose, to China, the Philippines, Java, Siam and India. The ocean-going vessels of Japan at that period numbered over 200.

It may perhaps be worth while to recall how warships of Western style were introduced into Japan.

In 1838 the Mito clan, obtaining some necessary information from a Dutchman (the Dutch were the only foreign traders who were allowed to come to Nagasaki until after the commercial treaty was made with the United States of America) built the first ship on a foreign model ever constructed in Japan. Although this ship was completed and named *Hitachi-maru* it was never allowed to be used.

After the visit of American men-of-war in 1853, the Tokugawa Shogunate permitted the building of large ships, and at the same time ordered from Holland, through their trading agents, one steam corvette, one sailing corvette, with auxiliary steamers of different sizes; but these vessels did not arrive in Japan, owing to the trouble existing in Europe at that time.

In 1854 a two-masted ship, the *Howo-maru* (length 130 feet, beam 30 feet) was built at Uraga, on an English model; and at about the same time two more were built, one at Yedo (Tokyo), the other at Satsuma, both of which were planned on European models.

At the time of the Crimean war a Russian sloop was wrecked on the coast of Japan, and permission was given that Japanese workmen might be employed in repairing the vessel; this

gave an opportunity to obtain some practical working knowledge of Western naval architecture.

In 1855 His Majesty the King of Holland presented a steam corvette to the Tokugawa Shogun, which was named the *Kanko-kan*. At this time the Japanese ensign Himomaru (the sun or a red ball in a white ground) was introduced, and has been used as the national flag ever since.

Subsequently the naval school was established at Nagasaki by the Tokugawa Shogunate, and instruction in naval matters was given there by Dutch naval officers. The students for admission to this school were appointed by the Shogunate, and also selected by the different clans. Another naval school was organized at Yedo with *Kanko-maru* as a training ship, and employed both Dutch and English officers as instructors. Some new ships were built at Nagasaki, and two ships were bought abroad, one of which named the *Kanrin-maru* afterwards (1860) made a cruise to San Francisco manned by Japanese officers and crew under Captain Katsu (late Count Katsu).

In 1857 Her Majesty Queen Victoria presented a steam yacht to the Tokugawa Shogun, and it was named the *Hanrio-kan*.

In this way the navy of the Tokugawa Shogunate was slowly gathered together and organized, and in 1867 nine men-of-war and 36 auxiliary vessels were on the list (besides the ships belonging to the different clans).

Then came the War of Restoration (1867), and most of the ships of the Tokugawa Shogunate, except the Iron-clad *Kotetsu* (old «Stonewall Jackson»), led by Admiral Yenomoto (the rebel chief), fled to Yezo Island (Hokkaido) and fought a battle at Hakodate which resulted in the total destruction of the rebel fleet, which, however, had lost some of their best ships before the battle.

After the War of Restoration the clans in possession of the warships presented them to His Majesty's Government, and the Imperial Navy was formed and organized in 1867-1870. The ships in 1872 were 20 in number, the aggregate tonnage being 12,390 tons.

The Imperial Navy had experienced a few engagements before the war with China in 1894-1895, such as the Formosan Expedition of 1874; the bombardment and capture of Yeisojo in Korea by H. I. M. S. *Unyo* in 1875; the Satsuma Rebellion in 1877.

At the time of the war between Japan and China in 1894, the Japanese naval force consisted of 1 small iron-clad of 3,777 tons displacement; 3 coast-defence cruisers (Itsukushima class) of 4,278 tons; 1 second class cruiser (*Yoshino*) of 4,216 tons; 4 protected cruisers of between 2,230 and 3,700 tons; 11 corvette and gunboats of between 1,000 and 2,000 tons; and 25 torpedo boats. The aggregate tonnage of the above was 59,006 tons.*

The most noted engagements of the China-Japan War were: The opening engagement off Asan, Korea; the battle of the Yalu; the torpedo-boat attack at Wei-hai-wei; the occupation of the Pescadores, Takao and Ampin.

After the China-Japan War the Japanese Navy commenced the building of battleships and cruisers under the new scheme to increase its strength, and at the outbreak of the war between Japan and Russia in 1904, the Japanese force consisted of 6 battleships of 13,000-15,000 tons; 8 armored cruisers of 7,700-10,000 tons; 14 protected cruisers of 3,000-4,800 tons; 10 coast-defence ships of 7,000 tons and under; 19 gunboats, etc., of 2,000 tons and under; 19 torpedo-boat destroyers and 87 torpedo boats. The aggregate tonnage of the above was about 270,000 tons.

At the end of the Russo-Japan War, the loss sustained by Japan was as follows: 2 battleships; 2 protected cruisers; 2 coast-defence ships; 4 gun vessels, etc; 2 torpedo-boat destroyers; and 9 torpedo boats. The captured Russian men-of-war, etc., augmented the Japanese Navy as follows: 6 battleships of 9,600-13,500 tons; 1 armored cruiser of 7,700 tons; 2 protected cruisers of 6,600 tons; 2 coast-defence ships of 4,900 tons: 2 torpedo gunboats of 400 tons; and 3 torpedo-boat destroyers.

The Naval Administration.—At first, after the Restoration, the Imperial Army and Navy were controlled by one department; but in 1872, in the process of organization, they were made separate and independent departments of the Government.

The management and control of the Imperial Navy is carried out under the direction of the Minister of Marine, who is appointed from the flag officers of the active list. Being a member of the Cabinet, he is directly responsible to the Emperor for all actions of the Ministry of Marine. He acts in naval matters concerning the movement of ships, schemes of mobilization, national defence and naval intelligence, in consultation with the chief of the Naval General Staff.

The Naval General Staff Department is independent of the Ministry of Marine, its chief being under the direct control of H. I. M. the Emperor.

There are five Bureaus in the Ministry of Marine: Military Affairs, Personnel, Medical, General Account Provision and Clothing, and Justice.

There are also four departments under command of the Minister of Marine: The Department of Materiel (naval construction, engineering, ordnance and torpedoes, general supply and stores), the Department of Naval Education, the Department of Works and Buildings, and the Department of Hydrography.

Naval Station and Dock Yards.—The coast of the Empire is divided into four naval districts, and the headquarters of each is placed at the chief naval port of that district, and is called Chinjufu (naval station). Headquarters of the first naval district are at Yokosuka; the second at Kure, the third at Sasebo, the fourth at Maizuru. Port Arthur was added as another Chinjufu after the Russo-Japan War. There are also three secondary naval stations: Takeshiki (Tsushima Island); Bako (Pescadores Islands); O-minato (Bay of Awomori).

Each Chinjufu is commanded by an Admiral,

*The Chinese naval force at the same period was 81 ships, 77,389 tons, and 25 torpedo boats, 1,042 tons; but at the conclusion of the war most of the Chinese men-of-war and torpedo boats were either destroyed or surrendered and only the Nanyang and Kanton fleets, insignificant in power, were saved.

who is Commander-in-Chief, and the following official functions are under his control: The Personal Staff, consisting of the Chief of Staff, Adjutants, Aid-de-camp, Inspector of Signal Stations, Recruiting Officers, etc.; the Arsenal (dockyards, ordnance and torpedo factory and depot, general supply stores); the Accountant Department (including works and buildings, provision and clothing stores); the Hospital; the Naval Barrack; the Torpedo Division; the Steam Reserve; Port Office; Court Martial.

The Secondary Naval Stations are organized on a smaller scale and have the means of small repairs for torpedo craft, etc.

The arsenals and their present capacity is as follows: Kure—able to build armored and unarmored ships, engines and guns of any size; to furnish armor plates, torpedoes and ammunition. Yokosuka—able to build armored and unarmored ships and engines of any size; and make all kinds of repairs to ships and armaments. Sasebo and Maizuru—able to build ships of moderate size and make all kinds of repairs to ships and armaments. Tokyo—the manufacture of small stores for ordnance and torpedoes, and some special articles. (The arsenal at Tokyo does not belong to any naval station.)

Personnel.—For the fiscal year ending 1907 the number of officers and men voted for the Imperial Navy were as follows: Officers, 3,088; Warrant officers, 976; Petty officers and men, 34,701. Officers and men in reserves in 1907 numbered: Officers of N. R., 322; Warrant officers, 143; Petty officers and men, 13,978.

The officers of the Imperial Navy are divided into two classes, the executive and non-executive officers. The executive naval officers are Admirals, Captains, Commanders, Lieutenant-Commanders, Lieutenants, Sub-lieutenants, Midshipmen, Naval Cadets, Gunners and Boatswains. The non-executive naval officers are Engineer Officers (Engineer-Admiral, Engineer-Captain, Engineer-Commander, etc.); Medical Officers; Paymasters; Naval Constructors; Ordnance Engineers; Hydrographical Engineers; Carpenters; Bandmasters and Warranted Writers.

Executive Officers.—In the Imperial Japanese Navy the naval cadets are appointed by competitive examination, which is open to the sons of all Japanese subjects. The entrance examination is held, at present, in 13 of the principal towns of the country, under the supervision of the superintendent of the Naval College. The number of cadetships available for the year having been previously gazetted by the Minister of Marine, applications are made to the superintendent of the Naval College through the local authorities within the specified limit of time. A candidate must not be under 16 or over 20 years of age. A candidate is examined in the following subjects: Japanese composition, mathematics, English, Chinese, geography, history, physics, chemistry and drawing; also, if the candidate desires, in French, German or Russian. Successful candidates become naval cadets and join the Naval College at Yetajima, on the Inland Sea near the Kure naval station. The traveling money to the college is paid, and at the college everything is provided by the Government.

The cadets remain in the Naval College three years, and are instructed in seamanship, navigation, higher mathematics, English, physics, chemistry, gunnery and torpedoes, steam engineering, etc.

After having passed the final examination successfully they are appointed to the sea-going training-ships as midshipmen. At the end of eight months' cruising the midshipmen are examined in what they have learned on board, and then transferred to a commissioned ship, generally appointed from among the ships of the squadron, and after four months, if favorably recommended by the captain of the ship, are commissioned as Sub-lieutenants.

Promotion of naval officers is entirely by selection, and the list of candidates deserving that honor is decided upon by the Board of Admirals, which meets once a year. This Board is composed of eight or nine members, but when sitting to decide the list of promotions, all the Commanders-in-Chief of naval stations and the squadrons, with the senior officers of the different branches, such as engineers and medical corps, etc., are summoned, and the Minister of Marine takes the chair. Officers of the following rank who have been on duty for the specified number of years are eligible for nomination: Sub-lieutenants, 1 year; Lieutenants, junior grade, 2 years; Lieutenants, 5 years; Commanders, 2 years; Captains, junior grade, 2 years; Captains, 2 years; Rear-Admirals, 3 years.

Naval officers are placed on the retired list on account of age, ill-health or disability. The age-limit of the several ranks is as follows: Admirals at the age of 68; Vice-Admirals at the age of 63; Rear-Admirals at the age of 58; Captains at the age of 53; Captains, junior grade, at the age of 48; Commanders at the age of 45; Lieutenants at the age of 43; Lieutenants, junior grade, at the age of 38; Sub-lieutenants at the age of 38; Chief Gunners and Boatswains at the age of 51; Gunners and Boatswains at the age of 48.

All officers are retired five years after being placed on the reserve list.

Engineer Officers.—The appointment of engineer students is effected in the same manner as the appointment of naval cadets. The student joining the Naval College of Engineering remains three years and four months, going through a course of advanced mathematics, physics, chemistry, theory of the steam engine, etc. They also receive practical training in the engineering workshops of the Yokosuka dockyard, receiving instruction in iron shipbuilding, the working of marine engines and boilers, the practical use of the various instruments used in the engine-room, as well as in the construction and working of electric light, torpedo and gun machinery. The student successfully passing the final examination becomes an Engineer Sub-lieutenant, and is appointed to a sea-going training-ship, where he receives the practical training necessary for a man-of-war.

After eight months' training on board, the students are examined and commissioned as Engineer Sub-lieutenants, gaining the succeeding steps of promotion, as in the case of executive officers.

Medical Officers.—Candidates for the medical

branch of the navy are required to pass a medical examination before being allowed to go up for the competitive examinations. The latter include medicine, surgery, science, and modern languages. Successful candidates become probationary Assistant Surgeons of the navy, and have to join the Navy Medical College for instruction. They remain there not less than one year, and if they pass the examination at the college successfully, are appointed to the hospitals of the different naval stations. After a certain period of time, if recommended, they are commissioned as Assistant Surgeons; succeeding steps of promotion are by selection. The successive grades of rank are Assistant-Surgeon, Surgeon, Staff and Fleet Surgeon, Surgeon-Inspector, and Surgeon-General. Surgeons are also appointed from among the graduates of the Imperial Universities without the examination of science.

Paymasters.— Probationary assistant paymasters are selected by competitive examination after having successfully passed the required medical examinations. Candidates must not be under 20 or over 28 years of age. Successful candidates are appointed probationary assistant paymasters, and sent to the Paymaster Training School to receive a course of instruction there for eight months. At the end of that time they are, after examination, appointed to different commissioned ships to receive practical experience, and after four months of that training, if favorably recommended, become Assistant Paymasters, gaining succeeding steps of promotion by selection. Ranking is as follows: Assistant Paymasters, Paymasters, Chief, Staff, and Fleet Paymasters, Paymaster-Inspectors, and Paymaster-Generals.

Naval Constructors.—Every year a certain number of the naval architecture students from the Imperial University can make application to become students of the navy. The expenses of the successful candidates are paid by the navy, and on being graduated they are appointed Assistant Naval Constructors. Promotions to Naval Constructor, Chief Inspector and Inspector-General of Naval Construction are gained by selection.

Ordnance Engineers.—Ordnance Engineers are appointed in the same manner as Naval Constructors. Naval officers and engineers can also enter this branch by special appointment if desired.

Hydrographical Engineers.—Students in this branch are taught in the Hydrographical Office the theory and practice of surveys, etc., and, passing a successful examination, are appointed assistants. Assistants can acquire rank as high as that of Captain. As this branch of the service can be performed by naval officers, the continuance of this department in the future is doubtful.

Warrant Officers.—The executive warrant officers are gunners and boatswains, gunners and torpedo-gunners having to have their qualification of gunnery or torpedo instructions before promotion. The non-executive branches holding relative ranks are engine-room artificers, bandmasters, carpenters, writers, and nurses. They are all selected from the petty officers of their respective bodies, having served at least two years at sea. A warrant officer of more than ordinary ability can, after six years of service, be promoted to be chief warrant officer which ranks with Sub-lieutenant, and chief warrant officers of long and meritorious service receive the rank of Lieutenant when placed on the reserve list.

Petty Officers and Men.—The Petty officers and the men of the navy are divided in the same method as the warrant officers. Petty officers, with the exception of the writers, are all appointed from the men. There are three ranks in every branch—viz.: The chief or first, second, and third class petty officers. The men are enlisted in two classes, the volunteers and the conscripts; the first serve for eight years, the second for four. Both classes are allowed to renew their enlistment for terms of three years until the petty officers reach the age of 45, and the men that of 40 years of age. Men appointed to be petty officers must serve six years from the day of appointment. The age of enlistment for volunteers is as follows: Seamen and Stokers, 17 to 21 years; Carpenters' Crew, Nurses, Blacksmiths, etc., 17 to 26 years; Bandsmen, 16 to 19 years. The age of conscripts must be over 20.

Examinations for the promotion of petty officers and men are held twice every year, and they are eligible for the examination if they have served at sea as follows: Petty Officers—First class or chief petty officers, one and a half years as second class petty officers; second class, one year as third class petty officers; third class, one year as leading seamen. Men—Petty officers, leading seamen or first class men, able seamen or second class men, and ordinary or third class men, are examined in April and October. Boys are examined in May and November. Boys are trained for four months in the naval barracks at each naval station, and then sent to the sea-going training-ships for two months at least before being distributed among the ships of the squadron, etc. From among able seamen and upwards to first class petty officers inclusive, a certain number of men are selected and examined to become seamen gunners and torpedo men, and the successful candidates are trained respectively at the gunnery and torpedo-training stations at Yokosuka.

There are three different courses of instruction for seamen gunners, torpedo men, torpedo instructors, etc.: (1) A course for seamen gunners; (2) a course for gunnery instructors; (3) recapitulatory, or short course. Stokers, carpenters' crews, and blacksmiths are given the same instruction as seamen, and are trained in the artificers' training station according to their standing as seamen. Further details of the instruction of other branches of petty officers and men are unnecessary, it being similar in principle to that given for the seamen class.

The Naval Academy.—Advanced instruction for naval officers and engineers is given at the Naval Academy situated at Tokyo. It is conducted by a Rear-Admiral superintendent and several instructors and officers of different ranks, as well as by a staff of professors. The courses of instruction for officer students are divided as follows: (1) Officers' long course, two years; (2) officers' short course, one year; (3) optional course, one year (nearly); (4) engineers' long course, two years; (5) engineers' short course, one year.

Officer students are nominated by the Commander-in-Chief of naval stations and squadrons, and by officers having similar authority, according to a notice given once a year by the Minister of Marine. A candidate for a long course must have had experience of sea duty for three years, be in good health, possess good judgment and a fair knowledge of his profession, and have a good record. Officer students for the optional course are not nominated, but make application, stating the subjects to be studied, and permission is granted them by the Minister of Marine if he sees no objection. Officer students of this class include Captains, Commanders, and Lieutenants.

The principal subjects taught at the academy for officers are: (1) Strategy; (2) Naval Tactics; (3) Military Tactics; (4) History of War; (5) Ordnance and Machinery, including gunnery, torpedoes, naval architecture, steam engines, hydraulic and electric machinery; (6) Navigation, Meteorology, Coast Survey, etc; (7) Fortification; (8) Land Survey; (9) Navy and Military Administration; (10) International Law.

Preparatory subjects are advanced mathematics, dynamics, physics, applied dynamics.

Optional subjects are criminal law of the navy, modern languages, photography.

The subjects for engineer officers are, first part: (1) Steam engines; (2) Practical Engineering; (3) Designing of Engines and Machinery; (4) Naval Architecture; (5) Construction of Ordnance.

Second Part. (1) Theory of Steam Engineering; (2) Kinematics of Machinery; (3) Strength of Material; (4) Resistance and Propulsion; (5) Hydrodynamics and Hydraulic Machinery; (6) Electricity and Electric Machinery and Apparatus.

Preparatory subjects are Mathematics, Dynamics, Physics, Chemistry, Metallurgy.

Optional subjects are Criminal Law of the Navy, Modern Languages, Photography.

Officers choosing the optional course may select any of the subjects enumerated above, but the selection thereof must be made at the time of application.

Naval Expenditure.—The expenditure for The Imperial Navy is divided into two classes: Ordinary expenditure and extraordinary expenditure. The ordinary expenditure is for the maintenance of the navy and the extraordinary expenditure for construction and new establishments.

The following figures will give some idea of the increase in expenditures of the Imperial Navy since 1870, compared with the tonnage of the ships:

Fiscal year	Expenditures.		Tonnage
	Ordinary, yen.	Extraordinary, yen.	
1870.....	886,856	.....	13,767
1880.....	2,817,912	291,890	25,727
1890.....	5,412,491	4,089,201	61,763
1900.....	19,484,952	24,494,374	255,497
1901.....	21,063,345	15,262,843	258,077
1902.....	21,530,237	14,587,619	263,077
1903.....	8,132,720	12,480,498	298,222
1904.....	12,332,139	11,079,801	280,524
1905.....	28,914,073	11,693,495	367,894
1906.....	33,414,695	49,067,524	426,234

The special expenditures of the Japan-China War and the Russo-Japan War were as follows: Japan-China War (1894-1895), 35,955,-137 yen; Russo-Japan War (1904-1905), 239,-578,251 yen.

Besides the ordinary and extraordinary expenditure, the navy has special funds for shipbuilding and ordnance materials, which are divided among the dockyards and arsenals as follows: Shipbuilding Material Fund.—Yokosuka, 1,060,000 yen; Kure, 860,000 yen; Sasebo, 860,000 yen. It is intended to increase this fund to 6,500,000 yen in aggregate ($3,237,000). Ordnance Fund.—Kure, 805,000 yen; Tokyo, 240,000 yen; Yokosuka, 142,000 yen; Sasebo, 135,000 yen; Shimose powder factory, 45,000 yen. This sum is to be increased to 3,000,000 yen in aggregate ($1,494,000).

Conclusion.—The strength of the Imperial Japanese Navy will be maintained in the following manner: In 1899 an Act was passed supplying 30,000,000 yen as a fund for the reconstruction of ships and torpedo boats. This sum of money was placed in deposit at the Treasury, and increases by compound interest. This interest (saving always the 30,000,000 original) can, at the discretion of the Minister of Marine, and making it clear in the Budget, be expended on reconstruction works. In addition to this, from 1904 on, the fund is added to per annum according to the following proportions: For protected ships, 3.9 per cent.; for unprotected ships, 5.4 per cent.; for torpedo boats, 6.15 per cent. of the value (first cost) of a warship or torpedo boat.

Ships and torpedo boats which have been constructed for the following periods are removed from the list, and no funds are raised for them; protected ships, 25 years; unprotected ships, 18 years; torpedo boats, 15 years.

VICE-ADMIRAL SAITO,
Minister of Marine, Tokyo.

19. Japan—Russo-Japanese War. *Causes of the War.*—The Russo-Japanese War was caused by the conflict of interests between the two nations owing to the pursuance by Russia of a policy of expansion in the Far East.

Commencing the colonization of Siberia from the latter part of the 16th century, Russia steadily advanced towards the East, until after about a century she succeeded in the subjugation of nearly the whole of that vast region. She then advanced into Manchuria, with the result that China objected to her action and the Nertchinsk Treaty, by which the boundary line between the two countries was fixed, was concluded on 27 Aug. 1689. By virtue of this treaty, Russia had to withdraw from the Amur region, which she had occupied, and was checked from seeking an outlet on the Pacific coast for about a century and a half. This did not mean, however, that Russia abandoned her eastern policy, and with the appointment of Muravieff to the governorship of Eastern Siberia in 1847, she began to move towards the southeast, and by way of the Amur at last reached the Sea of Okotsk. On 16 May 1854, she concluded the Treaty of Aigun with China, by which she annexed the district to the north of the Amur. Two years after, when China was invaded by the allied troops of Great Britain and France, General Ignatieff, the then Russian Ambassador at Pe-

RELIEF MAP OF THE FIELD OF RUSSO-JAPANESE WAR.

FROM A MAP PREPARED BY THE INTELLIGENCE BUREAU OF THE WAR DEPARTMENT OF JAPAN

king, took the opportunity to win the good will of the Chinese Government by intervening between China and her enemies. In return for this service, the Treaty of Peking was signed on 2 Nov. 1860, by which Russia took possession of the district east of the Usuri, and thus for the first time in her history expanded her dominion to the coast washed by the Sea of Japan. She now founded the city of Vladivostock, which she made the basis for carrying out her long-cherished Far Eastern policy.

But as the long distance between St. Petersburg and Vladivostock proved impeditive in many ways to the successful realization of her scheme, Russia determined to connect the two cities by rail. Thus the construction of the Siberian railway was commenced in May 1891 and finished about ten years later. Russia now found herself in possession of a powerful instrument in realizing her policy, but she was not satisfied, for being ice-bound in winter Vladivostock was not suited to her commercial and strategical purposes. Russia, therefore, wished to get an ice-free port somewhere in the south and waited for an opportunity to attain that object.

In 1894 the Japan-China war broke out and in the following year, by the Treaty of Shimonoseki, China agreed to cede to Japan the Liaotung peninsula. Seeing in this a great obstacle to the pursuance of her policy, Russia, backed by Germany and France, coerced Japan to return the Liaotung peninsula to its original owner, which act of Russia was viewed by the Japanese people with anything but gratitude.

In 1896 Russia signed a secret treaty, the celebrated Cassini Treaty, with China, by which she obtained the privilege of constructing railways in Manchuria. She founded the Eastern Chinese Railway Company, and immediately set herself to the work of building railways in that region. In December 1897, she took another decided step forward. She occupied Port Arthur and Talien, the very places from which she had ousted Japan, obtained the formal lease of the two ports from China on March 27 of the following year, and immediately began to equip them with armaments.

In 1900 the Boxer rising took place in China, which was quelled by the allied troops of the Western Powers and Japan. Russia, which had now completed her two lines of railway in Manchuria, seized the opportunity to send out a large force to that region on the pretext of guarding the railway, and after the Boxer disturbances were over refused to withdraw her troops. Thus she not only continued the practical occupation of Manchuria, but, gradually increasing pressure on Korea by encroaching on the Yalu as well as by diplomacy in Seoul, menaced most seriously the independence of that kingdom. As a matter of fact, Russia's ambition on Korea was not a new thing. After the conclusion of the Japan-China War, M. Waeber, the then Russian Minister at Seoul, left nothing undone to extend Russia's influence in the Korean court by utilizing the anti-Japanese faction. Subsequently, M. Speyer, who succeeded M. Waeber as the representative of Russia in Korea, attempted to get practical control over the financial and military power of that country. This attempt, however, was frustrated owing to a strong protest made by Japan and Great Britain. During the years following the Japan-China War, no less than three agreements had been arrived at between Russia and Japan, and at last it looked as if Russia was going to slacken her pace. As soon, however, as her plans were matured in Manchuria, her activities again began to show themselves in Korea, in many cases completely ignoring the agreements above referred to.

The attitude of the Japanese Government toward this state of affairs is best expressed by the following quotations from Baron Komura's dispatch to the late Japanese Minister in St. Petersburg. He says: «The unconditional and permanent occupation of Manchuria by Russia would create a state of things prejudicial to the security and interest of Japan. The principle of equal opportunity would thereby be annulled and the territorial integrity of China impaired. There is, however, a still more serious consideration for the Japanese Government. That is to say, if Russia was established on the flank of Korea, it would be a constant menace to the separate existence of that empire, or at least make Russia the dominant power in Korea. Korea is an important outpost in Japan's line of defence, and Japan consequently considers her independence absolutely essential to her own repose and safety. Moreover, the political as well as commercial and industrial interests and influence which Japan possesses in Korea are paramount over those of other powers. These interests and influences, having regard to her own security, Japan cannot consent to surrender to, or share with, another power.»

The Japanese Government, however, was eager for peace and made overtures to the Russian Government in July 1903 to come to a friendly agreement concerning the settlement of the Manchurian and Korean problems. Having obtained the consent of the Russian Government, a memorandum was drafted which would form the basis of agreement.

The main points in the memorandum were (1) that Russia and Japan should both respect the independence and territorial integrity of China and Korea and maintain the principle of equal opportunity toward all nations; (2) that the two nations should reciprocally recognize Japan's preponderating interests in Korea and Russia's special interests in railway enterprises in Manchuria, and that each had right to take such measures as was necessary for the protection of their respective interests; (3) that each nation was free to send troops to protect the interests mentioned above; (4) that Russia should recognize the exclusive right of Japan to advise and assist Korea in the interest of civil and military reform. Against this memorandum Russia sent on 3 October a counter proposal demanding that Japan recognize Manchuria to be outside her sphere of interest and forego her exclusive right to assist Korea in making military reform, and that Japan and Russia should mutually engage not to use Korea for strategical purposes, as well as to consider that part of Korea lying to the north of the 39th parallel as a neutral zone.

Besides, Russia quietly suppressed in this counter note the important clause providing for equal opportunity for the commerce and indus-

try of all nations. On the receipt of this counter note the Japanese Government, after several conferences with Baron Rosen, the then Russian Minister in Tokyo, proposed a fresh memorandum containing the «irreducible minimum,» which was accordingly communicated to the Russian Government on the last day of October. In this new memorandum Japan made several important concessions, (1) Japan would engage not to undertake on the coasts of Korea any military works capable of menacing the freedom of navigation in the Korean Straits; (2) she would agree to the proposal of Russia to create a neutral zone, but that said zone to be created at the Korean—Manchurian frontier and to extend 50 kilometres on each side; (3) that Russia and Japan should mutually declare that Korea was beyond the sphere of the «special» interest of Russia and Manchuria of Japan.

To this note Russia replied only on 11 December. In this new counter note Russia was entirely silent on the subject of Manchuria, and regarding Korea repeated the restrictions proposed in September, including the restriction of Japan's giving advice and assistance on military matters. On 21 December Japan made her last attempt to come to terms with Russia, and M. Kurino, the then Japanese Minister to St. Petersburg, was instructed to present a *note verbale* to the Russian foreign minister. In this *note verbale* the Russian Government was requested to reconsider her contention that Japan had no right to have a voice in the affairs of Manchuria and that Japanese assistance to Korea be limited to civil affairs only; besides Japan finally requested Russia to give up the idea of creating a neutral zone out of the Korean territory north of the 39th parallel. To this Russia gave reply which reached Tokyo on 6 Jan. 1904, again insisting that Japan should recognize Manchuria as beyond her sphere of influence; that Japan should agree to the Russian proposal of creating a neutral zone in North Korea; that Japan should be accorded full right to the privileges according to the existing treaties, but no right to establish settlements; and no mention was made of China's territorial integrity in Manchuria.

Against this the Japanese Government made another proposal on 13 January making further concessions, such as giving up the claim to special interest in Manchuria, provided Russia agreed to grant full privilege for the enjoyment of treaty rights acquired from the Chinese Government besides giving up her claim to special interests in Korea. But to this last proposal Russia kept postponing reply, while reports of Russian military preparation on the Yalu side of Manchuria kept coming.

On 1 February the Governor of Vladivostock warned the Japanese commercial agent there to prepare for withdrawing his compatriots. Under these circumstances it seemed doubtful to Japan whether the Russian Government was really sincere and wished an amicable agreement. The Japanese government felt that it had made all possible concessions in the interest of peace, and on 5 Feb. 1904 sent a note informing the Russian Government of the severance of friendly relations between the two countries. On 10 February Minister Kurino withdrew from St. Petersburg, while Baron Rosen, the then Russian Minister at Tokyo, left the Japanese capital on the following day.

Opening of Hostilities.—No sooner was Russia informed of the severance of friendly relations than Japan prepared for hostilities. In order to assume the offensive attitude, it was necessary for Japan to hold the command of the sea. With that object in view, the naval authorities organized a combined fleet consisting of four divisions.

Vice-Admiral Togo, who shortly before had been appointed commander-in-chief of the combined squadrons, left Sasebo on board his flagship *Mikasa* on 6 February with the entire fleet. Russia's Pacific squadron consisted at that time of 57 vessels, whose aggregate tonnage was about 190,000 tons, while Japan possessed 76 warships with an aggregate tonnage of about 270,000. The main strength of the Russian fleet was then concentrated at Port Arthur, only two vessels being stationed at Chemulpho and three others at Vladivostock. The main strength of the Japanese fleet went to attack the enemy's squadron at Port Arthur. It was found that most of the Russian warships were at anchor on roadstead outside the harbor of Port Arthur. During the night of 8 February, 18 Japanese destroyers approached those warships and by torpedoing greatly damaged the *Retvizan* and two other vessels. On the following day, the fleet again opened fire on the Russian ships, and after an indecisive engagement, withdrew to its base in the Korean sea. Previous to this, the Fourth Division of the fleet, commanded by Rear-Admiral Uryu, went to Chemulpho and by summoning out the Russian gunboat *Corcets* and the cruiser *Varyeg* engaged them in battle in the neighborhood of the island of Phalmi on the 9th and greatly damaged them. After 35 minutes' action the Russian ships were compelled to return to Chemulpho, where shortly after the two ships blew up.

By these two naval actions Japan secured the supremacy of the sea, so that henceforth her troops could be sent free of danger to any place in Korea and Manchuria. On the 10th the war was formally declared by the Emperors of both powers and on the 12th Japan established military and naval headquarters in the Imperial Palace at Tokyo.

Operations of the Manchurian Armies.—Under the escort of a squadron commanded by Rear-Admiral Uryu, the advance-guards of the Japanese army, which consisted of four battalions, landed at Chemulpho on 8 February, and passing through Seoul rapidly advanced northwards and occupied Phyng-yang, which is a town of the greatest strategical importance between Seoul and Wiju, a town on the left bank of the Yalu. By that time some Russian troops had been advancing southward, and made their appearance on 28 February at a point about five miles north of Tsi-sing-man, one of the gates of Phyng-yang. A skirmish with the Japanese outposts took place, in which the Russians were repulsed. This was the first land engagement of the war. The Japanese troops, now greatly augmented by contingents which constantly arrived, marched northward, and having occupied

Wiju on 3 April concentrated on the left bank of the Yalu. These constituted the First Army, being made up of three divisions, with General Kuroki as the commander-in-chief. The Russians, who had occupied the right bank of the river, concentrated their main strength at Kiuliencheng, and tried to prevent the Japanese from crossing the river. In face of incessant and heavy firing of the enemy, however, the troops succeeded in constructing a bridge across the river and by means of this bridge carried out the general attack of the enemy's position at Kiuliencheng on 1 May. Severe fighting, lasting for more than two hours, took place, resulting in the complete victory of the attackers. The Russians, who were greatly outnumbered, fled, hotly pursued by the Japanese, who captured Feng-hwancheng on 6 May and continued to advance in the direction of Liaoyang. Hsihoyen, to the east of Liaoyang, was the key to the defence of that city. The Russians had stationed three brigades there and defended the place with the greatest tenacity. But Japanese troops belonging to the Twelfth Division made a most fierce attack and compelled the Russians to evacuate the place on 18 July. Thus by the beginning of August the Japanese were already menacing Liaoyang. Previous to this, the Independent Tenth Division, commanded by Lieut.-General Kawamura, which had the mission of connecting different armies assigned to it, landed at Takushan on 19 May, and coöperating with a detachment of the First Army occupied Sinyen on 8 June. By this time the organization of the Fourth Army was completed, with General Nozu as commander. It landed at Nauchienao and joined the Tenth Division at Sinyen. The combined army now advanced by way of Fenshuiling, and after occupying Tohmucheng, turned northward and pressed on toward Liaoyang.

The Second Army, led by General Oku, landed in Liaotung peninsula at Yentaao on 5 May, being charged with the task of bringing pressure on the rear of Port Arthur. About the middle of the peninsula, there is a narrow isthmus, on which a high hill called Nan-Shan stands, and at its foot is a town called Kinchow. It is a place of the greatest strategical importance, constituting the first barrier to Port Arthur. General Stoessel, commander of the Port Arthur garrison, resolved to retain it at all cost, so that he might respond to the advance of the relief army from the north on the one hand and defend Talien on the other. For several weeks past he had spared no pains to fortify the hill by digging trenches, mounting heavy cannon, laying subterranean mines and wire entanglements and adopting every other method of defence known to military science. Against this strongly defended hill, General Oku hurled three divisions on 26 May, and with the coöperation of three Japanese warships, which fired on the enemy from the sea, succeeded in dislodging the Russians from their position after a fierce battle. In this way, Port Arthur was completely isolated. The Russians in the direction of Liaoyang thought to recover the hill in order to restore communication between the south and north. With that object in view, they concentrated their strength to the north of Wafangtien. The Japanese turned to the north to meet them and fought a battle at Tehlitz on 16 June, inflicting a crushing defeat on the enemy. The Japanese then pressed on Kaiping and after three days' fighting occupied the town on 9 July. Subsequently they marched further north and by taking possession of Haicheng and Niuchwang on 3 August, menaced Liaoyang.

Thus, the First, Second and Fourth Japanese Armies won victory after victory, and now marched on Liaoyang from three sides; while the Third Army under General Nogi took the place of the Second Army in pressing the siege of Port Arthur.

The Siege of Port Arthur.—Soon after Russia leased Port Arthur from China, she commenced to convert it into one of the strongest fortresses in the world. She built there many forts and mounted on them guns of various calibres, quick-firing guns, machine guns and heavy cannon. Between each fort, trenches or tunnels were built for communication, and in front of the forts covered trenches, wire entanglements, subterranean mines, abatises and other means of defence were prepared. In fact, Port Arthur was armed to the teeth with every description of the latest and most powerful of weapons and defended by every means which human ingenuity could devise, while a great army and a powerful fleet, commanded by General Stoessel and Admiral Stark respectively, were awaiting the attack of the Japanese. There is little wonder that in the course of the Russo-Japanese War, the Japanese found Port Arthur the hardest nut they had to crack.

Beginning with the attack made on 8 February, the Japanese fleet repeatedly essayed its strength against Port Arthur. On 13 February, in face of a great snowstorm, it attempted a torpedo attack, but without much avail. It then attempted to block the entrance to the harbor by sinking steamers there. The first attempt was made on 24 February, when four steamers were sunk at the entrance. Later three more similar attempts were made, in which the Japanese were partly successful. One remarkable fact in connection with those daring blocking attempts was that officers and men vied with each other to take part in the task, which meant almost certain death. As a matter of fact, more than 2,000 officers and men volunteered to serve in the third attempt. On 13 April, several Russian warships suddenly emerged out of the harbor and appeared to be attempting to escape, but being met by the Japanese fleet with heavy firing steamed back to the harbor.

It was at this time that the Russian flagship *Petropavlovsk*, striking one of the mechanical mines which had been laid by the Japanese the previous night, exploded and sank. Vice-Admiral Makaroff, who had succeeded Admiral Stark as commander-in-chief of the Russian fleet some time before, was on board the *Petropavlovsk*, and was drowned with more than 600 of her officers and crew. The Japanese, however, were not free of similar disasters. On 12 May the despatch-boat *Miyako* struck a Russian mine and sank while engaged in clearing the Talien harbor of mines. Three days after, the cruiser *Yoshino* sank off Port Arthur in consequence of a collision during a thick fog with the cruiser *Kasuga*. On the same day, the

battleships *Hatsuse* and *Yashima,* two of the most powerful ships of the Japanese navy, were destroyed, having struck the enemy's mines; and to add to these misfortunes, the gunboat *Oshima* and the destroyer *Akatsuki* were also lost. In spite of these repeated disasters the Japanese commanders continued to harass the enemy with greater vigor than before. On 26 May, when the town of Kinchow was taken, thus isolating Port Arthur, Vice-Admiral Togo declared blockade over the coast of Liaotung between Pitszwo and Pulantien, and while keeping up a vigilant watch over those vessels which attempted to smuggle provisions and ammunition to Port Arthur, greatly assisted the land force in harassing the enemy. On 10 August the whole of the enemy's fleet attempted to escape from Port Arthur. The Japanese fleet met them about 30 miles off Port Arthur and in a fierce battle which ensued inflicted heavy damage. For instance, the Russian flagship *Cesarevitch* was greatly injured and Rear-Admiral Vithoft was killed. Other Russian ships also sustained severe damage and steamed back to the harbor of Port Arthur, except four which made good their escape to Kiaochow and elsewhere. After this great naval engagement, the Russian fleet lay concealed in the harbor and never again attempted to escape.

On 6 June, General Nogi landed at Liaotung peninsula at the head of the Third Army, and starting from Kinchow, which had been occupied by the Second Army, advanced southward, pressing the rear of Port Arthur by the beginning of August. The Russian garrison in that fortress was now apparently doomed. On 16 August a *parlementaire* was sent by the Japanese army to the commander of the fortress communicating him of the Imperial wishes with regard to the disposal of non-combatants and also counselling his surrender. On the following day, the enemy replied to the communication, refusing either to deliver the non-combatants or to surrender. So the Japanese army opened a general attack on the fortress on the 19th. A bloody fight followed, which lasted till the 23d. The Russians held their positions with great tenacity and courage, and the Japanese were only able to capture the East and West Forts of Panlungshan at great cost. The attack on the North Fort of Tungkeikwanshan proved most costly, the losses sustained by the Japanese being extraordinarily heavy. Under these circumstances, the Japanese concluded that Port Arthur could not be taken by storm, and resolved to carry on a long siege.

Japanese Naval Operations in the Direction of Vladivostock and Saghalien.—At the beginning of the war, the Russians had three warships at Vladivostock and were ready to meet the Japanese on the sea by the coöperation of the Vladivostock squadron and the Port Arthur squadron. On 6 March, Vice-Admiral Kamimura, commander of the Second Squadron, led seven warships to a bombardment of Vladivostock. The enemy's ships, however, did not venture out and give battle. On 25 April they unsuspectedly made their appearance off Gensan, Korea, and attacked and sank the *Kinshumaru*, a Japanese transport. On 15 June they again sank another transport, the *Hidachi-maru,* and on 30 June some of their torpedo boats raided Gensan. Despite these frequent appearances, they successfully eluded the Japanese warships, until on 14 August they were caught by the Kamimura squadron off Ulsan, Korea, while they were steaming southward. In the engagement which followed, the *Rurik,* one of the Russian cruisers, was sunk and two others were heavily damaged. The Vladivostock squadron then became entirely inactive.

The Russian cruiser *Novik,* which had escaped to Kiaochow from Port Arthur after the naval engagement on 10 August, was requested by the German authorities there to leave the port. In consequence, she left Kiaochow and for some time her whereabouts was unknown. It was later found that she was proceeding towards Vladivostock by a roundabout way on the Pacific. The Japanese cruisers *Tsushima* and *Chitose* at once gave chase and, overtaking her at Korsakoff, in Saghalien, completely disabled her.

The Battles of Liaoyang and of the Shaho.—The first goal of Japan's Manchurian armies was Liaoyang. As the different armies approached it there arose the necessity of establishing headquarters, which should control and direct their movements. Thus, on 24 June, the headquarters of the Manchurian armies were created with Marshal Oyama as its head and General Kodama as chief of the staff. They left Tokyo for the front on 6 July. In the meantime, General Kuropatkin, commander-in-chief of the Russian armies in Manchuria, had his headquarters between Liaoyang and Mukden, and was trying to check the advance of the Japanese armies. At the beginning of August, Japan's First Army was at Yushulingtsz and Yangtzling, the Second at Haicheng and the Fourth at Tohmucheng. Marshal Oyama made the First Army the left wing, the Fourth Army the centre and the Second Army the right wing, and ordered a general advance on Liaoyang, so that by about 23 or 24 August the Japanese armies found themselves in the vicinity of Liaoyang. Confronting them, the enemy had Lieut.-General Stackelberg with three army corps opposed to the Second and Fourth Japanese armies, Lieut.-General Ivanoff with two army corps opposed to the First Army, and General Kuropatkin with all the reserve forces stationed outside Liaoyang, besides providing a flying column to meet a flanking attack. On 25 August the Japanese right wing opened fire on the Russians, and steadily defeating them pushed forward until on 1 and 2 September it occupied positions behind Liaoyang. In the meantime, the Japanese Central Army and left wing also operated against the enemy. They dislodged him from his positions at Anshantien and Sheushampao one after another, and hotly pursuing pressed on Liaoyang. It was originally the plan of the Russians to rendezvous their retreating troops at Liaoyang, but due to the hot pursuit of the Japanese armies much confusion occurred among the Russians, and a great army, probably 250,000 strong, fled northward. By 4 September the Japanese armies completed the occupation of Liaoyang. The Japanese armies in this fight probably numbering 200,000. In this engagement the Japanese casualties were roughly estimated at 18,000, and those of Russia at more than 25,000.

The news of the Russian defeat at Liaoyang caused consternation at St. Petersburg, and at a conference held before the Throne loud were the voices condemning General Kuropatkin. The result was that General Gripenberg, who had always been on bad terms with Kuropatkin, was appointed commander of the Second Russian Army. Moreover, Kuropatkin was constantly urged to go to the relief of Port Arthur. In these circumstances, Kuropatkin decided to take the offensive with the view of wiping out the disgrace he had sustained at Liaoyang. He led a great army southward and the battle of the Shaho ensued.

On that occasion, the Russians marched against the Japanese positions by three different roads. On 9 October, General Stackelberg, at the head of two army corps, attacked the Japanese right wing. This was the beginning of the great battle, which continued to be fiercely fought in all directions until the 15th, there being some minor engagements till the 17th. Everywhere the Japanese were victorious and the Russians fell back in the direction of Mukden by taking three roads to the east of the railway.

After the battle of the Shaho, the Japanese Manchurian armies remained inactive for some time, taking no step other than checking the advance of the enemy in the direction of the Shaho. Their intention was to wait for the fall of Port Arthur and join General Nogi's army to themselves, so that they might advance northward *en masse* and inflict a crushing defeat on the enemy.

The Fall of Port Arthur.—Since the first general attack made on 19 August, the investing army of Port Arthur made altogether four general attacks on the fortress before 26 November. But every time the Russians offered a stubborn resistance, causing great losses to the Japanese. There is a hill known as the 203-metre hill at the northwestern extremity of the line of fortifications behind Port Arthur. It is the highest hill at the back of the fortress and from its summit the whole view of the harbor and town can be obtained. For this reason, the hill is the key to the fate of the fortress. On the occasion of the second general attack, the First Division attacked it with all its might for four consecutive days and nights, but failed to take possession of it after having lost heavily in its fighting strength. From 27 November, the investing army again made another attempt to capture it, concentrating all the fires of its artillery and hurling column after column against it. A most fierce and bloody hand-to-hand fighting resulted, and at last during the night of the 30th a detachment of Japanese succeeded in carrying the hill. On the following day, however, the Russians returned to a counter-attack in great force and innumerable were the casualties on both sides. So heavy indeed were the losses that the sides of the hill were literally covered with the killed and wounded, and in order to recover them the *parlementaries* from the opposing forces met and arranged for a partial armistice.

After the killed and wounded were removed, fighting was resumed with redoubled fury. It was only on 5 December that the Japanese succeeded in repulsing all the counter-attacks of the Russians and completing the occupation of the 203-metre hill.

When the 203-metre hill fell into the hands of the Japanese the fate of Port Arthur was practically sealed. Establishing a watchtower and mounting heavy cannon on its summit, the Japanese army bombarded the enemy's warships in the harbor day after day, which, without having any shelter to protect them, were easily hit and sunk one after another. The *Sevastopol* and some other vessels, which had escaped beyond the range of cannon, were attacked with torpedoes and completely disabled, and by 11 December the Russian Pacific squadron was annihilated. Then the Tungkeikwanshan Fort was taken by the Japanese on the 16th, the Erhlungshan Fort on the 28th and the Sungshushan Fort on the 31st.

By this time, the Russian garrison found itself in the last extremity of distress. Its store of food and ammunition was almost exhausted, it had no place to take in the wounded and sick, and its combatants were nearly worn out, due to unceasing fighting, with scarcely enough strength left to take up arms. In these circumstances, General Stoessel saw no other way but to surrender. On 1 Jan. 1905, he sent a *parlementaire* to the Japanese army in order to negotiate terms of surrender. General Nogi, commander of the investing army, accepted the request, and commissioned Major-General Ijichi, chief of his staff, to meet and discuss the terms of surrender with the Russian commissioner on the following day at Sinshiying. At this meeting the terms of surrender were agreed upon and signed by both commissioners. After all the fortifications and other military equipments had been duly delivered by the Russians into the hands of the Japanese, on 5 January General Stoessel came out of the fortress and met General Nogi. Previous to this, the Emperor of Japan, on hearing of the capitulation of the Port Arthur garrison, magnanimously desired that, in appreciation of General Stoessel's arduous services for the sake of his fatherland, he should be accorded all the honors of war. In consequence, General Stoessel and 536 officers were allowed to wear arms and return to Russia under obligation not to take part again in the present war. General Vock and a number of officers, however, refused to be released on parole, and were consequently sent to Japan as prisoners of war. Altogether 40,243 officers and rank and file were made prisoners of war.

Thus Port Arthur fell, and in consequence the blockade over the coast of Liaotung by the Japanese navy was discontinued, and a Naval Admiralty was established at Port Arthur with Vice-Admiral Shibayama as commander, and on 15 January General Nogi made the formal entry into the fortress.

The Battles of Heikautai and of Mukden.—The Russian defeat at Liaoyang and the fall of Port Arthur made a great impression on European Russia. Russia, which had enjoyed the fame of being a great military power, must inflict at least one defeat on the Japanese in order to save her face. It was at this time that General Kuropatkin saw that the strength of the right wing of the Japanese Manchurian armies, which were stationed in the direction

of Heikautai, was comparatively weak. Here was a chance to score a victory. So General Kuropatkin ordered General Gripenberg to cross the Hunho and commence forward operations against the right wing on 23 Jan. 1905. Lieut-General Tachimi, who was commanding the Japanese troops at Heikautai, confronted him and the battle was opened on the 26th. It was fought for three consecutive days and nights, and yet the fortune of war remained undecided. On the 29th, all the Japanese regiments, determining either to drive off the Russians once for all or be annihilated in the attempt, made a most fierce attack, and despite great losses caused by machine-guns, pushed forward and on the following morning at last succeeded in compelling the enemy to retreat.

After the defeat at Liaoyang, the Russians had been gradually concentrating their strength at Mukden, where they assiduously prepared defence-works and attempted to check the advance of the Japanese toward the north. In the meantime, the Japanese army was also greatly augmented, due to the joining of the Third Army after the capitulation of Port Arthur and that of the Yalu Army under the command of General Kawamura. Marshal Oyama now saw the opportune moment had arrived to take Mukden, and ordered a general advance on the enemy's lines centering on Mukden. His general plan was: the Central, Left and Right Armies were to essay a frontal attack on the enemy by disposing themselves between Penhsiku in the east and the left bank of the Hunho in the west; the Third Army was to be in the left of the left wing, and the Yalu Army in the right of the right wing, so that the one might be between the right bank of the Hunho and its left bank and strike at Mukden from the northwestern direction by taking a roundabout way, while the other might work in conjunction with the right wing from the direction of Hsiencheng, attack the enemy in the direction of Hsingcheng and capture at one blow both Mukden and Fushun. This plan was faithfully and excellently carried out. The memorable battle was opened 19 February. The extreme right wing of the Japanese armies pushed northward after occupying Chinghocheng, pressed on the left bank of the Hunho and, occupying the entire neighborhood of Fushun by 10 March, drove off the enemy in that region northward. The Russian casualties in this direction were not less than 20,000, while those of the Japanese were only some 3,800. As for the extreme left wing, it commenced operations on 27 February, and advancing from the west toward the northwest emerged in the rear of the enemy, and while the Japanese Central, Left and Right Armies were still confronting the Russians along the Shaho, was menacing Mukden itself with the railway line between it and the city. These prompt actions of the Japanese two extreme wings greatly contributed to victory, for the Russians, already hard pressed in front, were thrown into utter confusion, finding themselves attacked from the rear. By 11 March, the Russians in the direction of the Shaho retreated to the right bank of the Hunho in disorder, and either by being hotly pursued or being surrounded, lost heavily. So great was the Russians' defeat indeed that in the direction of the Shaho their casualties were over 90,000. On the 15th Marshal Oyama made the formal entry into Mukden, and the office of the Tartar-General of the city was made the seat of his headquarters. The Battle of Mukden was probably one of the greatest battles since history began, its battle line having extended to more than 125 miles, while the armies confronting each other numbering probably 450,000 on the Russian side and 350,000 on the Japanese side. After that battle the Japanese armies continued the pursuit of the retiring Russians, and Tiehling, Kaiyuan, Changtu and other places fell into their hands one after another.

The Battle of the Japan Sea.—When Port Arthur was completely isolated, Russia organized a second Pacific squadron with the purpose of relieving it. Led by Vice-Admiral Rojestvensky, it left Libau for the Far East on 16 Oct. 1904. The squadron was divided into two divisions, one of which voyaged round Africa, while the other passed through the Suez Canal. They joined again at Madagascar on the day on which Port Arthur capitulated. In April 1905, it stopped at different ports in French Annam, one after another, and on 5 May was joined by a third Pacific squadron commanded by Rear-Admiral Nebogatoff. As Port Arthur had already fallen, the Russian fleet steamed northward with the purpose of entering Vladivostock. Admiral Togo, commander-in-chief of the Japanese fleet, anticipated that the enemy's fleet would attempt the passage of the Straits of Tsushima, and calmly waited for its coming, having concentrated all his naval strength at the base of operations. At 5 A. M. on 27 May, he received a wireless telegram saying that the enemy's fleet was sighted. He at once issued orders to different detachments of warships to sally forth and meet the enemy according to a prearranged plan. At 2 P. M. on the same day, the opposing fleets confronted each other to the north of Okinoshima Island. Admiral Togo hoisted on the masthead of his flagship, *Mikasa*, a signal saying: «The fate of the Empire depends on the issue of this battle. All are expected to do their best.» At 2.08 P. M. the enemy opened fire, but the Japanese fleet refrained from responding until the range became less than 6,000 metres. Then it opened fire. It was both fierce and effective, and in a short time, beginning with the *Oslabya*, which led the enemy's fleet, and the flagship, *Kniaz Suvaroff*, most of the Russian warships were either sunk or disabled, and when darkness set in the Japanese destroyers and torpedo-boats made daring attacks on the still remaining vessels of the enemy. On the following day, the Japanese fleet succeeded in intercepting five Russian vessels, which were trying to escape northward. Rear-Admiral Nebogatoff, who commanded this detachment of the Russian fleet, saw the utter futility of resistance and surrendered. As for Vice-Admiral Rojestvensky, he was found on board a captured destroyer in a seriously wounded condition and made a prisoner of war. Of the 38 vessels which had attempted the passage of the Straits of Tsushima, 20 were sunk and five were captured by the Japanese, and only four cruisers and a few destroyers and transports made good their escape. Thus it is no exaggeration to

say that the Second and Third Russian Pacific Squadrons were practically annihiliated. In contrast to this overwhelming loss sustained by Russia, the Japanese losses consisted of only three torpedo-boats.

Thus Russia lost on land Liaoyang, Port Arthur and Mukden, while on sea the First, Second and Third Pacific Squadrons. The issue of the war was now clearly decided.

The North Korean Army.—For some time after the outbreak of the war, Japan stationed only small garrisons at different places in Korea, but in view of frequent raids made by the Russians into the northern province of Hamgyong, headquarters of the Japanese troops in the peninsula were established at Seoul in the summer of 1905, with Lieut.-General Miyoshi as commander-in-chief. The North Korean Army thus organized for the first time occupied the important town of Kyong-syong on 20 June and steadily advancing northward cleared the Pu-ryong and Pu-peuk districts of the enemy by 24 July, and occupying Kyong-heung, a town on the frontier of much strategical importance, was in a position to menace Vladivostock.

The Subjugation of Saghalien.—Not long after the battle of the Japan Sea a Saghalien expeditionary army was organized with military and naval contingents under the command of Lieut-General Haraguchi. On 4 July 1905, a squadron commanded by Vice-Admiral Kataoka left Otaru escorting a number of transports with troops on board. On 8 July the Japanese occupied Korsakoff without difficulty and advancing further north occupied Alexandrovski on the 24th, and on the 30th Lieut-General Haraguchi proclaimed military administration over the whole island. On the same day the Russian Military Governor of the island asked for an armistice, and on the following day the Japanese and Russian commissioners met to discuss the terms of surrender. The Russians agreed to Japan's terms, and 3,270 officers and men surrendered. In this way Saghalien was completely subjugated in three weeks.

Since the outbreak of the war, Japan had won every battle on land and sea. Especially the great victories of the battles of Mukden and of the Japan Sea placed her in a most favorable condition as to the ultimate issue of the war. It was at this time that President Roosevelt of the United States urged the two combatants to lay down their arms. After duly considering different aspects of the situation, the Japanese Government concluded that it was wise to listen to the friendly advice of President Roosevelt. On 3 July 1905, Baron Jutaro Komura, Minister for Foreign Affairs, and Mr. Kogoro Takahira, Japanese Minister at Washington, were appointed plenipotentiaries for negotiating the terms of peace with Russian plenipotentiaries, (M. Witte and Baron Rosen). The peace conferences, which were held at Portsmouth, U. S. A., 29 August, arrived at a satisfactory conclusion and the Treaty was signed by the plenipotentiaries of both parties on 5 September. See PORTSMOUTH, TREATY OF.

TOKIWO YOKOI.

20. Japan — Retrospect and Prospect. Japan has never known a foreign invasion. In the middle ages a formidable armada was sent by the famous Kublai Khan to subdue the country, but it was successfully repulsed with the help of a timely gale. Hence the Japanese naturally entertain a deep sense of pride, are strongly inclined to uphold the independence and dignity of their country, highly respect the traditions of their forefathers and in all ways endeavor to maintain their national characteristics. Such is the ideal which they have always cherished and the spirit with which they are animated. But there is another trait—the people are ready to recognize anything good in other nations and do not hesitate to accept foreign ideas and adapt them to the advantage of their own country. This is shown by the introduction of the Chinese civilization in ancient times and by the importation of the Western civilization in our own day.

During the 7th, 8th and 9th centuries, A. D., Japan had much intercourse with China. In those days China was the most enlightened country in the East, and it was then that Japan introduced the Chinese civilization. It was then also that the Korean civilization was introduced, which, however, was nothing but a branch of the Chinese civilization. Thus we can say that Japan in her civilization is indebted in no small degree to China and Korea, but the time came when there was a fear that the nation had gone almost too far in imitating things Chinese,—making itself too subservient to them. Thereupon, at the instance of the famous scholar and statesman, Michizane Sugawara, Japan's official intercourse with China was terminated. The phrase «Japanese soul and Chinese intelligence» is said to have originated with him. The fact that the national intercourse was given up in order to save the nation from temporary evils is not, as the proverb says, unlike the killing of a bull by trying to straighten his horns. It is, therefore, impossible to give absolute approval to the above measures, but they are historical facts. Not long after this, the country was plunged into a state of continued civil disturbance, followed by the ascendency of militarism. With this, the civilization imported from the Continent showed a decline, military simplicity taking the place o. ornamentarism in manners and customs as well as in all kinds of institutions. The good single feature we acquired during these days in the formation of the national character was the development of the Bushido. The attempted invasion of the Mongolian armada, above referred to, was an event which took place in the latter part of the 13th century and its cause was the refusal of the Japanese to recognize the extension of the supremacy of the ruler of the Chinese Empire over their country. Such being the case, intercourse with China, which had been suspended previously, naturally continued in the same way after the war. But it was not rare that Chinese priests as individuals visited Japan, and some of them were even naturalized, while some Japanese priests also went over to China where they pursued their ecclesiastical studies. This state of things continued to the time of the Ashikaga Shogunate, when even commercial ships, under the direction of feudal lords in the western provinces, went over to China for trade.

Towards the end of the Shogunate many trading vessels of Europe—Spanish, Portuguese Dutch, and later on English,—began to visit Japan for trade. At this time also many Christian missionaries came to Japan. Foreign trade made fair development and the missionaries were well received by the natives. Owing to indiscretion on the part of the missionaries, however, the time came when the native authorities thought it necessary to keep them at arm's length. About the same time the Korean complication took place, and a large army under the direction of Hideyoshi crossed the sea to the peninsula and occupied it. As, however, China espoused the cause of Korea and sent large reinforcements, the Japanese troops encountered much difficulty in overcoming them, and moreover the sudden death of Hideyoshi made it disadvantageous to continue the war. Besides, previous to this Korean expedition the country had long been disturbed by domestic wars. For these reasons the nation now needed a rest, and the statesmen of the time saw the necessity of doing their best to bring about peace and work for the progress of the country. Hence the Tokugawa Shogunate, succeeding Hideyoshi, decided upon the policy of the entire seclusion of the country from the rest of the world. Then, not only was the prohibition of residence of the Western missionaries enforced more rigidly than ever, but the visits of the Western and Chinese trading ships were also stopped, with a few exceptions. At the same time Japanese were prohibited from leaving the country with the object of carrying on trade, and the building of large ships was also forbidden. This condition of affairs lasted till the advent of Commodore Perry.

This policy of seclusion had its advantages and disadvantages. During this time the country enjoyed a long spell of peace, and all kinds of art, industry, and intellectual pursuits in native style made progress in an unprecedented degree. But at the same time the Japanese lost all chance of developing themselves in a cosmopolitan way by shutting their eyes to outside progress. The arrival of Commodore Perry was the occasion that awakened the people to the reality of the situation. Since then the nation, from necessity, under the leadership of men of foresight, has discovered that the old style of civilization was not enough to preserve an independent existence inherited from their ancestors. Intercourse was therefore opened with Occidental countries and a new appetite was created for learning and a new desire awakened to utilize everything good in Europe and America. It is also no doubt true that the recent history of the two European military campaigns in China, and the latter's defeat on each occasion, provided a lesson for the Japanese, who thereby obtained an additional impulse to adopt the new attitude.

It must be noted that this principle of opening the country, which became a fixed national policy with the inauguration of the new Imperial Government, experienced many difficulties for the 14 years following the advent of Commodore Perry on the coast of Uraga. An anti-foreign movement was a very powerful factor. It is true that this movement was largely due to a real sentiment against foreigners, but it would be a mistake to attribute all the actions of the people connected with the movement to a sense of hatred against Occidentals. Among those joining the movement were men who did so on the ground that it was a disgrace to the country to have been forced to conclude treaties at the dictation of foreigners; men who would like to first effect the consolidation of the country and then to propose from their own side the conclusion of treaties. Moreover, at that time another important movement, which aimed at the restoration of the Imperial authority, had already been mooted. This came to exercise a sharp influence concurrently with the confusion produced by the pressure from outside. There was then at Kyoto the Imperial Court, which was nominally the Supreme Government, and the Shogun's Government at Yedo, which actually governed the country, so that the country was under a sort of dual Government. Besides, the different provinces had their own feudal lords, who practically enjoyed autonomy. Thus there was no uniformity of administration. From the domestic point of view it was desired by those loyal to the Imperial Court to do away with the power of the Shogun and simultaneously augment that of the Emperor. From the point of view of Japan's international relations, it was necessary to improve the condition of the country and bring about uniformity of administration and other things, if she wished to open intercourse and maintain an equal footing with foreign Powers. Such being the case, there was much political dissension in the country, often resulting in conflicts of arms among the Japanese themselves and in attacks on foreigners and their ships. One thing, however, was certain; it was impossible to stick to the old condition of seclusion, and therefore with the inauguration of the new Government the principle of opening the country was definitely settled by the universal acquiescence of the people at large.

The history of Japan during the last 40 years may be said to be that of the unification of all sorts of domestic affairs and the introduction of western civilization. With the restoration of the Imperial authority 40 years ago, dual government was replaced by a unified Government under the Emperor. But as the different provinces still had their feudal lords, there was no real uniformity in military affairs, administration, education, judicial matters, economic and financial affairs, etc. It was necessary to effect a radical change in all these matters. The most difficult task was the abolition of the feudal system, but thanks to the wisdom of the Emperor and the sagacity of his Counsellors, as well as to the loyalty and patriotism of the feudal lords and their retainers, it was achieved without much difficulty not many years after the Restoration. Subsequently, all kinds of reforms, which were necessary for the unification of all departments of Government, were carried out with success one after another. In doing all this Japan's teacher was the Occident, because it was seen that it was necessary and advantageous to cast off the old notions and to introduce the new ideas from the West.

One of the five items in the oath which the Emperor took on the occasion of his ascension

to the Throne was to seek wisdom from all parts of the world. The policy above described was nothing more than the carrying out and extension of that Imperial oath. Moreover, one chief aim of the new Government was to do away with arbitrary ruling, and to govern the country by the assistance of the people, making the latter feel a common interest in the Government in order to maintain and promote the general welfare of the whole community. In other words, the object was to allow the people to share in state affairs. This was also the principle enunciated in another of the five Imperial oaths. And at last, in the year 1889, the Imperial Constitution was proclaimed, and the country made a Constitutional Monarchy. The Constitution was not suddenly granted at the urgent desire of the people, but was in truth the result of the Imperial oath, the different edicts subsequently issued, and the reforms carried out according to the principles under which the nation was now being governed.

Regarding foreign affairs the revision of the treaties was one of the most difficult tasks of the new government. The treaties which had been concluded with the Western Powers were not made, as we have already seen, *at the instance of Japan*, and therefore the chief provisions were not reciprocal, especially so with regard to jurisdiction and tariffs. Concerning jurisdiction, all foreigners enjoyed extra-territoriality both in civil and criminal cases. In reference of the tariff Japanese customs houses were subject to conventional tariff by virtue of the treaties. If we look back at the condition of the civilized countries of the West at the time when these treaties were concluded, such terms might not have been unreasonable from their point of view. But there was no reason why the Japanese people should permanently subject themselves to these one-sided obligations. Because, not only from mere sentimental reasons, but from the practical point of view, extra-territoriality had caused much inconvenience and abuse, and the restriction of the tariff crippled the good management of the country's finance. Further, as Japan had a right by the provisions of the treaties to demand their revision, she often attempted to effect such revision, but was unable to obtain the consent of the Powers. In consequence of this, several difficulties arose in domestic politics. At last, however, the consent of the Powers was obtained, and in the year 1894 the revised treaties were successively signed between the parties concerned. By this revision extra-territoriality was totally abolished and tariff autonomy was restored to Japan, excepting on some points regarding which conventional tariffs still remain effective for some years to come. Japan was now on an equal footing with the Occidental countries, and for this result she has reason to be grateful to Great Britain and America.

The past history of Japan's foreign relations is not without important events, the greatest being the China war and the recent war with Russia. These were not sought by Japan, but fortunately from the beginning the Japanese contentions secured the sympathy of all countries, and at last, as the result of the late war, Japan obtained the honor of being classed among the great Powers of the world. At the same time Japan increasingly feels the heaviness of her responsibility. Japan's military reform was executed mainly for defensive purposes and not from any desire of expansion. But the Army and Navy, reformed, helped Japan not only to secure victory in recent wars but to make her, beyond all her expectations, better known to the world.

I am not a prophet and therefore I cannot say anything for certain about Japan's future, but this much I can say: Japan will continue to feel more and more the seriousness of her responsibility, which has been made so great, and not inconsistently with this determination she will endeavor to contribute towards the maintenance of peace and the promotion of the general welfare of the world at large. Along with this, she will continue at home the progressive administration which was inaugurated with the establishment of the new Government, and will introduce reforms in places where there is still room for such. Thus she will continue to follow the common path of the world's civilization and share the benefits of its fruits with other countries.

MARQUIS ITO.

Japan'ning, the art of varnishing in colors. The article to be japanned is first brushed over with two or three coats of seed-lac varnish to form the priming. It is then covered with varnish, previously mixed with a pigment of the tint desired. This is called the ground color; and if the subject is to exhibit a design, the objects are painted upon it in colors mixed with varnish, and used in the same manner as for oil-painting. The whole is then covered with additional coats of transparent varnish, dried and polished. See LACQUERING; VARNISH.

Japheth, jā'fĕth, the second of the three sons of Noah, Gen. x. 1. His descendants peopled Europe and northern Asia. The Armenians, Medes, Greeks, Thracians, etc., were of the stock of Japheth. In Arabian legend he is said to have had 11 sons, each of which was the founder of a nation. Some philologists designate the Indo-Germanic languages by the term Japhetic, thus identifying his progeny with the Aryans; and the patriarch is said by others to be represented by the Japetus of Greek mythology, whose wife was Asia, and bore him a son Prometheus, the founder of civilization.

Jarves, jär'vĕs, **James Jackson,** American art writer: b. Boston, Mass., 20 Aug. 1818; d. Tarasp, Switzerland, 28 June 1888. In 1838, he sailed for the Sandwich Islands, and resided for several years in Honolulu, where he published the first newspaper ever printed there, the *Polynesian*. Before returning to the United States he traveled in California, Mexico, and Central America, and subsequently published a 'History of the Hawaiian or Sandwich Islands' (1843); 'Scenes and Scenery of the Sandwich Islands' (1844); and 'Scenes and Scenery in California' (1844). He afterward resided in Europe, and engaged in making a collection of old masters which eventually became the property of Yale University. For his services to Italian art he was made a chevalier of the Crown of Italy. His later works include: 'Parisian Sights and French Principles' (1855–6); 'Art Hints' (1855); 'Italian Sights and Papal Principles' (1856); 'Kiana, a Tradition of Hawaii' (1857); 'Confessions of an Inquirer' (1857); 'The Art Idea'; 'The Old Masters of Italy' (1861); 'Glimpses at the Art of Japan' (1876); 'Italian Rambles' (1884).

Jarvis, John Wesley, American painter: b. South Shields, England, 1780; d. 1840. John Wesley was his uncle and sent him in his fifth year to Philadelphia, where his father, a seafaring man, had settled. Jarvis had but little regular art training, but was encouraged by Malbone. He had a studio in New York and painted portraits of statesmen, preachers and soldiers, some of which are in the City Hall, New York, and in the collection of the New York Historical Society.

Jasher, jā'shẽr, Book of, a lost book of the Hebrew Scriptures, twice mentioned in the Bible (Josh. x. 13, and 2 Sam. i. 18), and about which various conjectures have been made. It was most probably a national song-book of post-Solomonic age, whose contents were partly secular, partly religious. From the mention of the book in Joshua and 2 Samuel it has been inferred that the book of Joshua could not have been written before the time of David's lamentation. But this assumes that the book of Jasher was all written at once, an assumption which in our ignorance regarding it we are not at liberty to make; for the book of Jasher may have been written at different times. The theory of Dr. Donaldson as to its scope and contents, in conformity with which he proceeded to reconstruct it from the fragments which he thought he could trace throughout the several books of the Old Testament, has met with little favor either from English or Continental scholars. See Donaldson, 'Fragmenta Archetypa Carminum Hebraicorum in Masorethico Veteris Testamenti Textu passim tessellata.'

Jasmin, Jacques, zhäk zhäs-măn (Provençal, JAQUOU JANSMIN), Provençal poet: b. Agen 6 March 1798; d. there 4 Oct. 1864. In his 'Mous Soubenis' (My Recollections) he gives a humorous description of the humility of his origin and of the poverty of his kindred. All his poems and songs are written in the patois of the peasantry on the banks of the Garonne, supposed in its purest state to be identical with the old Provençal, the language of the troubadours. His poetry deserved and acquired more than a local celebrity, and was warmly welcomed not only in Southern France, but throughout the whole of Europe. He was elected a member of the academies of Agen and Bordeaux; the city of Toulouse awarded him a gold laurel; and in 1846 he was created a Knight of the Legion of Honor. The poetry of Jasmin is distinguished by beauty and power, and though his genius inclined him to gaiety rather than to pathos, yet perhaps his most striking and successful passages are those in which he addresses himself to the feelings. His principal works are: 'The Charivari', (1825), a mock-heroic poem; 'Lou Tres de May' (1830), an ode; 'The Blind Girl of Castel Cuillé' (1836), his masterpiece in poetry, which has been translated by Longfellow; 'The Curl-papers of Jasmin' (1835); 'Françouneto' (1842); 'The Two Twin Brothers' (1846); 'Maltro L'Innoucento' (1847); and 'La Semmano d'un Fil' (1849). Consult Rabain, 'Jasmin, sa vie et ses oeuvres' (1867); Montrond, 'Jasmin, poète d'Agen' (1875); Andrien, 'Vie de Jasmin' (1882); Smiles, 'Barber, Poet, Philanthropist' (1892).

Jas'mine, or **Jessamine,** a genus (*Jasminum*) of beautiful plants of the olive family, including many cultivated species and varieties. Most of these are shrubs with long twining branches bearing usually compound leaves and panicles of fragrant white or yellow flowers. They are natives principally of the East Indies. The common jasmine (*J. officinale*) has become naturalized in the south of Europe, where it grows eight or ten feet tall, and is practically an evergreen. The oil of jasmine is obtained from *J. officinale* and *J. grandiflorum*, but it is usually imitated or adulterated. *J. sambac* also furnishes an oil in the East; and a very common greenhouse species is *J. humile*.

Several shrubs are called jasmines which are only loosely related to the true jasmine. Thus the red jasmine of the West Indies (*Plumeria rubra*), the source of the perfume frangipanni, is of the oleander family; the Chile jasmine, *Mandevillea suavolens*, is another fragrant species of the same family, widely cultivated, and others might be mentioned. Two of these outside "jasmines" are familiar in the United States, one of which is a native. The Cape jasmine

(*Gardenia florida*) is a Chinese (not South African) shrub of the madder family, which found its way to England and America about the middle of the 18th century; it is cultivated everywhere in greenhouses, in a double-flowered variety; and it grows out of doors along the southern seaboard, it being the special pride of Charleston, S. C., after one of whose citizens the genus *Gardenia* was named by Linnæus.

The native species is the Carolina or yellow jasmine (*Gelsemium sempervirens*), an exceedingly odorous climbing plant of the family *Loganiaceæ*, common throughout the South Atlantic States. It is a vine, whose blossoms grow in axillary racemes of from one to six vivid yellow tubular flowers; and "evening trumpet-flower" is a common name. "Early laden, indeed, is the warm air of spring with its delicious perfume. . . . Through woods and thickets it wends its way vigorously and gleams as brightly as does later the Cherokee rose. It is one of the joys of the season." The roots are regarded by the country people as possessed of medical virtues.

Ja'son, in Greek legend, the son of Æson, king of Iolcos in Thessaly, a hero of ancient Greece, celebrated for his share in the Argonautic expedition, before which he had distinguished himself in the Calydonian hunt. He belonged to the family of the Æolidæ at Iolcos, and his instructor was the centaur Chiron, who educated most of the heroes of that time. (For his adventures in the Argonautic expedition see ARGONAUTS.) On his return to Iolcos with Medea as his wife he avenged the murder of his parents and his brother by putting Pelias to death. But he was unable to retain possession of the throne, and was obliged to resign it to Acastus, son of Pelias, and flee with his wife to Corinth. Here they passed ten years, till Jason, wearied of Medea, fell in love with Glauce (Creusa, according to some accounts), daughter of Creon, king of Corinth, married her, and put away Medea and her children. Medea, having revenged herself on her hated rival, fled from the wrath of Jason in her car drawn by winged dragons, the gift of Helios, to Ægeus, king of Athens, after she had put to death Mermerus and Pheres, her sons by Jason. According to some, Jason killed himself from grief; but others relate that, after passing a miserable wandering life, he came to his death by accident. Others say that he was reconciled to Medea, and returned with her to Colchis, where he ruled many years.

Jas'per, William, American soldier: b. South Carolina about 1750; d. Savannah, Ga., 9 Oct. 1779. At the commencement of the revolutionary war he enlisted in the 2d South Carolina regiment, in which he became a sergeant. Subsequently, in the attack upon Fort Moultrie by a British fleet, he distinguished himself by leaping through an embrasure to the ground, under a shower of cannon balls, and recovering the flag of South Carolina, which had been shot off. Governor Rutledge presented him with his own sword, and offered him a lieutenant's commission; this, however, Jasper declined, saying: "I am not fit to keep officers' company; I am but a sergeant." His commander gave him a roving commission to scour the country with a few men, and surprise and capture the enemy's outposts. His achievements in this capacity seem to belong to romance rather than history, and in boldness equal any recorded in the revolutionary annals of the southern States. Prominent among them was the rescue by himself and a single comrade of some American captives from a party of British soldiers, whom he overpowered and made prisoners. At the assault upon Savannah he received his death wound while fastening to the parapet the standard which had been presented to his regiment. His hold, however, never relaxed, and he bore the colors to a place of safety before he died. A county of Georgia and a square in Savannah have been named after him.

Jasper, Ind., town, county-seat of Dubois County; on the Patoka River, and on a branch of the Louisville, E. & St. L. railroad; about 47 miles northeast of Evansville. Jasper is situated in an agricultural region. The chief manufacturing establishments are saw-mills, lumbering and planing-mills, flour-mills, a furniture factory, and a brick-yard. Pop. (1900) 1,863.

Jasper, an impure quartz, less hard than flint or even than common quartz, but which gives fire with steel. It is entirely opaque, or sometimes feebly translucent at the edges, and presents almost every variety of color. It is found in metamorphic rocks, and often occurs in very large masses. It admits of an elegant polish, and is used for vases, seals, snuff-boxes, etc. There are several varieties, as red, brown, blackish, bluish, Egyptian. Ribbon or agate jasper is jasper in layers.

Jassy, yäs'sē, Rumania, the former capital of Moldavia; on the Bahluiu River. The churches and educational institutions are quite noted; the industrial enterprises are few; but the commerce is extensive and important. The chief exports are petroleum, grain, meat, and salt; the chief imports are coal and clothing. It was in Jassy, in 1821, that Alexander Ypsilanti really began the work for Greek independence. About one-half the population are Jews. Pop. (1902) 80,500.

Jastrow, jăs'trō, **Joseph,** American psychologist: b. Warsaw, Poland, 30 Jan. 1863. He was a son of Rabbi Jastrow (q.v.) and came to America in childhood. He was graduated from the University of Pennsylvania in 1882 and has been since 1888 professor of psychology at the University of Wisconsin. He became president of the American Psychological Association in 1900. He has published 'Time-Relations of Mental Phenomena' (1890); 'Epitomes of Three Sciences' (1890); 'Fact and Fable in Psychology' (1900); 'Modern Psychology.'

Jastrow, Marcus M., American rabbi and lexicographer: b. Rogasen, Posen, 1829; d. Germantown, Philadelphia, 13 Oct. 1903. After the usual rabbinic and academic studies he graduated from the University of Halle in 1854, became a barber in Berlin, and then rabbi at Warsaw. After five years he was obliged to leave by reason of his political opinions, after being subjected to arrest. He was called to the Congregation Rodef Sholen, Philadelphia, in 1866, with which he was connected until his death, within recent years as rabbi *emeritus*. Besides some monographs and contributions to the press, he is best known for his 'Dictionary of the Targumim, the Talmud Babli and Yerushalmi, and the Midrashic Literature,' which is nearing

completion (1903) and is a monument of untiring erudition and broad scholarship.

Jastrow, Morris, Jr., American Orientalist: b. Warsaw, Poland, 13 Aug. 1861. He was a son of the preceding, and coming to Philadelphia with his parents in early childhood, he was trained in the schools of that city, graduated from its university in 1881, and from the University of Leipsic 1884. He has been for many years professor of Semitic languages and librarian of the University of Pennsylvania. He was originally trained for the Jewish ministry, studying for some time at the Jewish Seminary of Breslau, Germany, and was appointed assistant to his father's synagogue, Philadelphia, which position he voluntarily resigned. His published works are: 'Religion of the Assyrians and Babylonians' (1898); 'Two Grammatical Treatises of Abu Zakariyya Hayyug' (1897); 'A Fragment of the Babylonian Dibbarra Epic' (1891); 'The Study of Religion' (1901). He has edited 'Selected Essays of James Darmesteter' (1895). He is a frequent contributor to learned periodicals and to various encyclopædias.

Jatropha, jăt'rō-fạ, a genus of euphorbiaceous plants of the tribe *Crotoneæ,* tropical and chiefly American. They are of interest principally for their medicinal properties, which reside mostly in the seeds. These, in the case of *Jatropha curcas,* are called Barbados or physic nuts,—the last in allusion to their purgative power. The so-called jatropha-oil is extracted from the seeds of the coral-plant (*J. multifida*) and of the East Indian *J. glauca,* and is used externally as a stimulant. A common species in the southern United States is the spurge-nettle or tread-softly (*J. stimulosa*). Compare MANIHOT.

Jats, jâts, the most numerous of the agricultural population of the Panjab, India, numbering about four and a half millions. They are by many identified with the *Getæ;* and some of the best authorities accept the theory that they are descended from Scythian invaders of India in prehistoric times. Some scholars believe them cognate with the Gypsies (q.v.).

Jaundice, jän'- or jân'dĭs, a morbid condition arising from the circulation of bile in the blood, with consequent staining of the tissues and a peculiar train of symptoms resulting from the poisoning. The tint of the skin and certain mucous membranes varies from a light yellow to a brownish or saffron hue. Staining of the conjunctiva is first observed, and is most intense. Jaundice, with reference to its origin, may be either obstructive or toxic. The term obstructive means causing a hindrance to the outflow of the bile from the gall-ducts into the intestine, with its consequent absorption into the hepatic vein and general circulation. Not only is the skin stained, but all the secretions as well, the urine becoming dark brown. As no bile is thrown into the intestine, the stools become clay-colored and usually hard. There is frequently distressing cutaneous itching, and other skin-maladies are not uncommon. The blood partially loses its power of coagulation, and the vessels are apt to allow the escape of blood into the tissues, giving rise to purpuric spots. The pulse is usually slow, and the patient somewhat melancholic. In bad cases death may follow a period of convulsions, delirium or coma. The cause of this obstruction may be anything occluding the lumen of the ducts from within, as catarrh of the membrane of the intestine, where the bile-ducts open, or catarrh anywhere along the course of the ducts; stones or thickened bile may block up some part of the tubes, or they may be occluded from pressure on the outside by tumors, constricting bands, or shrinking of the liver-substance. (See LIVER, DISEASES OF THE.) The toxic form of jaundice is due to the circulation of poisons in the blood which break down the red cells or, more rarely, destroy the liver cells. The jaundice in this form is not so intense, and the other symptoms caused by the poison are of more importance. Many of the infectious diseases, such as influenza, typhoid fever, yellow fever, pneumonia, pyæmia, and acute atrophy of the liver, cause this form. Mineral poisons, particularly phosphorus, act in the same way. Jaundice in the new-born is so common as to be considered a natural condition, and usually lasts but a few days. It is evident from the many conditions that may give rise to jaundice that it must be considered as a symptom, and treatment should be directed to aiding the bodily functions until the exact cause can be determined.

Jaurés, Jean Leon, zhŏń lā-ôń zhō-rā, French Socialist: b. Castres 1859. He taught at Albi and Toulouse, and in 1885 entered politics and was elected to the Chamber of Deputies from Tarn; at this time he was a moderate Republican. In 1889 he failed of re-election, and returned to Toulouse, where he was active in the establishing of a college of medicine. Becoming a Socialist, he defended the strikers at Carmaux, and in 1893 was again elected to the Chamber, where he became one of the leaders of the Socialists. He failed of re-election in 1898, but was again elected in 1902. When the Socialist Millerand accepted a position in the cabinet, Jaurés defended his action, thus opposing Guesde and the *Parti Ouvrier,* but sought at the same time to reconcile the factions. He also took an important part in obtaining a revision of the Dreyfus case. He still holds a position of leadership and influence in the Socialist party of France, and is one of the best orators in the chamber of deputies. He has published 'Studies in Socialism' (1906).

Java, jä'vạ (native, *Siti-Java* or *Yava,* land of millet), an island of Dutch East India; situated between lat. 5° 52′ (Saint Nicholas Point), and 8° 50′ (South Cape) S.; and lon. 105° 13′ and 114° 39′ E. The island is bounded on the north by the Java Sea, on the east by Bali Strait, which separates Java from Bali Island, on the south by the Indian Ocean, and on the west by Sunda Strait which separates the island from Sumatra. It extends east and west, declining 15° toward the south. It is about 660 miles long, from 40 to 125 miles wide, and the area, including Madura Island, off the east coast, is about 50,554 square miles. The Indian Ocean, which beats with great force along the south coast, has prevented the formation, on that side, of such alluvial plains as extend along the north coast. From the same cause the south coast is generally unsafe for shipping, while the north affords excellent anchorage at almost all times and places. The south presents a continuous front of crags and rocks, forming the outer edge of an extremely mountainous country; the north is flat and low, and covered in

many places with mangrove swamps. The chief harbors on the north are those of Surabaya and Batavia; on the south that of Chilatjap, formed by the small island Kambangan.

Topography and Hydrography.— The whole configuration of the island has been transformed by volcanic action. There are at least 50 volcanoes in Java, of which half are active. In the western end of the island they are grouped in a mass and attain a height of 10,000 feet, but in the eastern portion, though more scattered, they are generally higher, one, Semeru, 12,044 feet, being the highest in the island. Among the chief are Salak (7,266), near Batavia, now extinct; Gedé (9,720); Tjirmaj (10,075); Marbabu (10,670); Raun (10,820); Slamar (11,250). Papandayang, in the southwest, destroyed about 3,000 persons in 1772. In 1822 great damage was done by the eruption of Galungung, one of the volcanoes in the western part of the island. In 1686, about 10,000 lives were lost by the eruption of Ringgihit, once over 12,000 feet high, but now a low mountain. The eruption of Kloet (q.v.), in 1901, was most disastrous. The eruption of Krakatoa (q.v.) in 1883, was one of the horrors of modern times.

The island is subject to earthquakes, usually not severe. Three earthquakes are known to have preceded and 19 accompanied volcanic eruptions. In 1867 occurred a most destructive earthquake. A low range of non-volcanic hills, about 3,000 feet high, extends along the south coast. The crater of an extinct volcano called Guwa Upas, or the Vale of Poison, about one half mile round, is held in horror by the natives. It is said that every living creature that enters it drops dead, and the soil is covered with the carcasses of deer, birds, and even the bones of men, killed by the carbonic acid gas which lies in the bottom of the valley; but its terrors have been much exaggerated. "In another crater in this land of wonders," says Sir Charles Lyell, "the sulphureous exhalations have killed tigers, birds, and innumerable insects; and the soft parts of these animals, such as the fibres, muscles, hair, etc., are very well preserved, while the bones are corroded and entirely destroyed." Numerous rivers flow from the north and south sides of the mountains, carrying fertility with them, and affording supplies to innumerable artificial water-courses used in irrigation. These streams are generally rapid, shallow, and so encumbered with sandbanks as not to be navigable; so that only two rivers, the Solo and the river of Surabaya, are navigable for large boats; the others are only suitable for proas or canoes of the lighest draught, or for floating down timber from the mountains. The Tji Tarun and the Tji Manuk are navigable a part of the year.

Climate.— Java is considered fairly healthy, but proper care must be taken to avoid the excessive heat of midday and the night air from the marshes. The temperature of the plains and valleys is during the day from 85° to 94° F., and during the night from 73° to 80°. At an elevation of 6,000 feet the thermometer descends to 60°, while the tops of the highest peaks are often covered with ice but no snow falls. The breezes from the water modify the temperature. There are two seasons; the dry from April to October, and the rainy season from October to April. During the rainy season there is an almost continuous rainfall except for a short time in the morning. The annual rainfall is about 80 inches. The island is not subject to storms which injure life or property, but near the high mountains there are frequently thunder storms.

Geology.— Java is formed mainly of tertiary, though partly of post-tertiary strata; but by volcanic action the arrangement has been much disturbed. Rocks containing fossil invertebrates are common, but the fossils of vertebrates have not been discovered. There are no metallic veins of sufficient length or depth to be profitable for mining; the Bantam coal-mines, in the northwestern part of the island, yield only lignite; sulphur, naphtha, and asphalt are found in several places, and small quantities of salt saltpeter, and magnese. Limestone and marble are in the southern part. Its minerals are not considered of sufficient value to be classed among its natural wealth-producing resources.

Vegetation.— With a temperature ranging from 94° to the freezing-point, a volcanic soil plenteously watered naturally and artificially, it is not surprising that Java should be of astonishing fertility; the range of its vegetation naturally follows that of its temperature, from the palms of the tropics to the mosses of the temperate zone. The coast is fringed with cocoanut trees; behind them the ground rises gently to the foot of the mountain chain, and is completely cultivated. Vast fields of rice, artificially watered, distributed amphitheatrewise on the flanks of the hills, yield often three harvests annually. In the same altitude are found the cotton plant, the mangoes, sugar-cane, indigo, palm-trees, and other tropical vegetation. Higher up than the rice-fields the bases of the mountains are covered with vast forests of the fig-tree tribe of different species, remarkable for their great height and vigorous growth. Tea, coffee, fruits, cinchona, sandalwood, mahogany, camphor, bamboo, rattan, and many other forms of vegetation are found in this altitude of from 2,000 to 4,000 feet. These are followed still higher up by the plane-like liquidambars, with their erect stems covered with parasites, also rattans and *Rubiaceæ*, the latter of numerous species, some of them exhaling a very fœtid odor. Along the upper limits of the liquidambars about 4,000 feet above the sea, lofty trees are still plentiful; here may be seen *Podocarpus cupressus*, with its lofty straight stem, a tree allied to the yew, and furnishing the best timber in Java; the Dammar pine, rhododendrons, laurels of numerous species, chestnuts, oaks, and several others, magnolias, myrtles, tobacco, maize, potatoes, and other vegetation common to the temperate zones. About 7,000 feet high the vegetation changes its aspect, and mosses appear, which, with heaths, are the principal plants found on the loftier elevations. Before leaving the natural vegetation the famed poison-tree, the chettik or upas (*Antiaris toxicaria*), may be named as a noted Javanese plant. The vast forests likewise claim notice; they are 791 in number, and cover a very extensive surface in 13 of the provinces, and consist mainly of teak. To prevent the waste which was going on, the government has placed them under superintendence,

and draws from them a large amount of revenue.

Animals.— Including domestic and marine animals 100 kinds of mammalia inhabit Java. In the west part the one-horned rhinoceros is not uncommon; and in the higher districts the royal tiger, panther, and tiger-cat keep the inhabitants in constant alarm by their depredations. The babiroussa and two kinds of wild hog form the large game of the island. There are only two species of the ape kind, but they people the forests in countless numbers. Two kinds of lemurs inspire the inhabitants with superstitious fear by their mysterious nocturnal habits: and this island may be esteemed the native seat of the largest bats, some of which measure five feet across the wings. They may be seen suspended from the branches in hundreds during the day, and at night they devastate the orchards and gardens. Two civets are common, and supply a perfume of which the Javanese are passionately fond; the wild ox abounds in the woods; and the buffalo is the only animal used in agricultural labor. The horses are small, but vigorous, and, as in India, are not used for agricultural purposes. Two species of wild dogs and six species of deer are found here. Among the domestic animals are the buffalo, ox, horse, goat and sheep. The ornithology of Java is rich and varied, both in genera and in species. About 300 species of land birds have been found on the island, among them the peacock, partridge, quail, 10 different species of pigeon, 11 species of heron, two of cuckoo, the woodpeckers, the black and crimson oriole, the hornbill, eagle, owl, the brilliant looking, and appropriately named minaret flycatcher, the "swift" (q.v.), and the minor bird so apt in learning to mimic human speech is common. Almost all the known generic groups of rapacious birds are found here in great numbers, and gallinaceous fowls are plentiful. A variety of reptiles are found on the island, among them the python. Insects cover the grounds and plants in countless numbers; but few are distinguished for brilliancy or variety of color, or are remarkable in form. Fish are plentiful in the rivers and along the coast; but those of the rivers are of inferior quality for food. Excellent oysters are abundant on the north coast, and prawns, from which a condiment called trasi is prepared and considered delicious by the natives. Crocodiles from 20 to 30 feet in length inhabit the water courses.

In 1895 there were in Java in all about 2,643,000 buffalos; 2,572,000 oxen and cows; and 485,500 horses.

Occupations and Productions.— The Javanese are almost entirely occupied in agriculture. There is a small class of fishermen on the north coast, and a few artisans in the towns, but the great bulk of the people live directly or indirectly by the cultivation of the land, in which they have made greater progress than any other Asiatic nation except the Chinese and Japanese. The chief crop is rice, of which with the aid of irrigation, industriously and almost universally applied, two crops are raised in a year. Lands that cannot be irrigated are used for growing pulses, oil-giving plants, cotton, sugar-cane, and tobacco; and on the mountain slopes, at an elevation of 2,000 or 3,000 feet, coffee is cultivated. "In the most fertile parts of Java," says Crawfurd, "and these from the neighborhood of the high mountains are usually also the most picturesque, the scenery is at once agreeable and magnificent, and certainly for grandeur and beauty excels all that I have seen even in Italy, that country which in summer bears the nearest resemblance to Java. In such situations we have mountains 10,000 feet high, cultivated to half their height, the valleys below having all the appearance of a well watered garden, in which the fruit trees are so abundant as to conceal the closely packed villages." The mechanic arts among the Javanese are not so far advanced as their agriculture. About 30 crafts are practised among them, of which the principal are those of the blacksmith or cutler, the carpenter, the sheath maker, the coppersmith, the goldsmith, and the potter. Bricks and tiles are largely made. The carpenters are skilful in house and boat-building. They make vessels of all sizes from 50 tons down to fishing canoes, and under European superintendence build large ships. The ordinary dwellings of the people are built of a rough frame of timber, thatched with grass or palm leaves, and with walls and partitions of split bamboo. The Javanese excel all other nations of the Malay archipelago in the working of metals. They are especially skilful in the manufacture of the national weapon, the kris or dagger, which is worn by every man and boy above 14 years as part of his ordinary costume, and by many ladies of high rank. They make also excellent gongs of brass, and these with other musical instruments of the same metal have long been exported to the neighboring countries. The only native textile material woven by the Javanese is cotton, of which they make only a stout durable calico, and this is purely a domestic manufacture, carried on exclusively by the women. From raw silk imported from China, the silkworm not being reared in Java, a coarse cloth is woven by the women. Paper of the nature of the ancient papyrus is a manufacture peculiar to the Javanese.

The greater part of the agricultural lands of Java is claimed by the Government of the Netherlands and the private estates are principally in the residencies in the western part of the island. The government or the private landowners can enforce one day's gratuitous work out of seven, and in some cases more, from all the laborers on their estates. In 1882 the greater part of the enforced gratuitous labor for the government was abolished in return for the payment of one guilder (40 cents) per head yearly. In 1900 the natives had under cultivation 7,073,036 acres. Prior to 1891, the government raised sugar; but since 1891 the sugar is all raised on private properties and on lands hired by the natives, or on lands held on emphyteutic tenure from the government. In 1900 the number of sugar estates was 191 and in 1901 the yield of sugar was 766,238 tons. The yield of cinchona for 1900 was 1,415 tons; of tobacco, 5,435 tons; of tea, 1,659 tons; of indigo, 180 tons.

Trade and Commerce.—The trade of Java is now large, and what was once a burdensome colony has become one of the principal sources of wealth to Holland. The great bulk of the

foreign trade is carried on through the ports of Batavia, Samarang, and Surabaya. The principal exports are sugar, coffee, cinchona, indigo, nutmegs, mace, cloves, cinnamon, pepper, tea, rice, cocoa, tapioca, cochineal, cubebs, arrack, tobacco, hides, india rubber, and tin. The exports, in 1900, of sugar, and coffee, nearly all of which was sent to Holland, amounted to nearly $55,000,000. A large amount of rice is sent to Borneo and China. The principal imports are cotton yarns and cloth, machinery, iron, coal, and woolen goods.

Education.— The Europeans and the natives have separate schools with a slight difference in their methods of government. Ample provisions are made by the government for the education of the natives. There are public and private schools, about 20 schools for girls only, and one normal school for the training of teachers for the natives, and two for the training of teachers for the schools for Europeans and those assimilated with them. There is an agricultural college, a museum, and a fine botanical garden at Buitenzorg, and a gymnasium at Batavia. In science the people have made little progress, possessing only a rude notion of astronomy and a slight knowledge of arithmetic. Their architecture at present day hardly deserves the name, though the country abounds with remarkable remains of temples built many centuries ago by the ancestors of the present inhabitants. Of the other fine arts, music is the one in which they have made the greatest progress. They are passionately fond of it, and have generally good taste. Their melodies are wild, plaintive, and interesting, and more pleasing to the European ear than any other Asiatic music. They have wind and string instruments, but their best and most common instruments are drums and gongs.

Religion.— All religious denominations are allowed perfect freedom in Java. The Javanese are Mohammedans, which faith was established by Arab conquerors in the 15th century and has almost displaced Brahminism and Buddhism, the ancient religions of the country. In 1896, in Java and Madura, there were 19,193 native Christians. In 1900 there were about 100 missionaries working among the natives.

Banking.— The "Java Bank," established in 1828, has a capital of $2,400,000 and a reserve of about $480,000. The government of the Netherlands has control over the administration. Two fifths of the amount of credits, notes, and assignats must be covered by bullion or specie. In March 1901, the notes in circulation amounted to $22,534,000, and the bank operations to $18,637,200. There are postal savings-banks and other savings-banks have been established. The legal coins are the same as those of Netherlands.

Weights and Measures.— The legal weights and measures are the same as those of Netherlands (q.v.).

Ethnology.— The native population of Java comprises two distinct nations, the Sundese and the Javanese. The Sundese occupy the western end of the island, and are greatly inferior in number to the Javanese, and less advanced in civilization. They speak a distinct language. Both nations are of the Malayan race. They are generally about two inches shorter than the men of the Mongolian and Caucasian races, with round faces, wide mouths, high cheek bones, short and small noses, and small, black, deep-seated eyes. The complexion is brown with a shade of yellow, and is never black. The hair of the head is thick, black, lank, and harsh, and is either scanty or altogether wanting on other parts of the body. A few short, straggling hairs compose the beard. The people are not active, and make but poor runners or wrestlers. They are described as a peaceable, docile, sober, simple, and industrious people. Mr. Crawfurd, author of 'A Descriptive Dictionary of the Indian Islands,' who lived several years in Java, says: "From my own experience of them, I have no difficulty in pronouncing them the most straightforward and truthful Asiatic people that I have met. The practice of running amuck, so frequent with the other cultivated nations of the archipelago, is of very rare occurrence with them." They are patient, enduring, and easily led when convinced that the orders given are not contrary to the ancient laws and customs of the country, which are held in religious reverence. They are very susceptible of affronts, which they are not slow to avenge with the kris, which is invariably worn, and they are frequently likewise armed with the sabre or pike. The mass of the Javanese take only one wife, but people of quality and wealth take advantage of the latitude allowed by the Koran, and practise polygamy. All, without distinction, are passionately fond of gaming, more especially of cock-fighting.

Population.— Java is one of the most densely peopled countries of the world. The population in 1900 was 28,745,698. The population of the principal towns in Java, January 1900, was:

	Europeans	Natives	Chinese	Arabs	Other Orientals	Total
Surabaya...	8,906	121,886	13,035	2,791	326	146,944
Batavia....	8,893	77,700	26,817	2,245	232	115,887
Samarang..	4,800	70,426	12,372	724	964	89,286

The whole population of Java is legally divided into Europeans and persons assimilated with them, and natives and persons assimilated with them. The Europeans and those assimilated with them are generally living under the laws which prevail in Netherlands, while the natives and those assimilated with them observe the customs and laws of India. The division of the population into the two classes mentioned is in accordance with the code which specifies the limits and conditions for legislation in Dutch East India. The governor-general, together with the council, has power to make individual exceptions to the general rule.

Government and Revenue.— The most important feature of Javanese society is the village, which forms a complete body politic, with considerable powers of self-government. Its officers are elected by the people, and are charged with the collection of the taxes and the maintenance of public order. The general government of the island is entrusted to a governor-general, appointed by the king of Holland. He is commander-in-chief of the army and navy, and possesses nearly absolute power. Justice is administered to the European inhabitants by a supreme court at Batavia, and by three provincial courts at Batavia, Samarang, and Surabaya. There are besides these other courts for the Asiatic population. In 1832 Gen. Johannes Graaf Van den Bosch introduced into Java a system of government known as the

'culture system.' In principal, it was based upon the officially superintended labor of the natives, directed so as to produce not only a sufficiency of food for themselves, but a large revenue for Netherlands. This obligatory labor was applied to the culture of coffee, sugar, indigo, pepper, tea, tobacco, and some other products; but at present the labor of the natives is required only for the culture of coffee which is marketed by the Government. By the terms of a bill which passed the legislature of the Netherlands in 1870, the obligatory cultivation of the sugar-cane is now totally abolished.

Java, including the island of Madura, comprises 17 residencies, each governed by a resident, assisted by assistant residents, and other officials. Before receiving government appointments, these officials must first have had examinations. The resident and his assistants, together with a number of native officials, exercise almost absolute control over the province in charge. The native officials are remunerated for their services by salaries or by a per cent on the amount of taxes collected. No law can be enacted or enforced by any governor-general which will conflict with the "Regulations for the Government of Netherlands India," laws passed in 1854 by the king and states-general of Netherlands.

The revenues are derived from the government monopolies of railroads, salt, opium, and from the sale of government products obtained under the "culture system." Other revenues are obtained from taxes on houses and estates, sale of government lands, custom duties, licenses, personal tax, and from a number of indirect taxes. The greatest expenditures are for the general administration, about one third, and for the army and navy another third.

Defense.— The army and navy of Java form a part of the defense of the whole Netherlands India. The army is colonial, and the regular army of Netherlands is not allowed on duty in any part of Dutch East India. The commissioned officers are Europeans, except a few prominent natives to whom honorary offices have been given. One half the non-commissioned officers must also be Europeans. There is a school attached to every battalion, and a military academy on the island of Java, at Meester Cornelis, a place near Batavia.

History.— Ancient Javanese history is written in the still existing magnificent remains of temples and other public buildings, which are plentifully scattered over the island. These attest that the worship of Brahma and Buddha once prevailed in the island under the Hindu empire of Modjopahit, the dismemberment of which was consummated by the Arabs 1478 A.D., by the destruction of a vast capital of that name. Islamism had previously supplanted the rival worships, and had driven their last adherents into the neighboring island of Bali. The island then fell under the dominion of numerous petty chiefs, and was found in that state by the Portuguese, the first European settlers on the island, who arrived in 1511. They were followed in 1595 by the Dutch, who soon eclipsed them. Though their views were at first directed wholly to commerce, the Dutch merchants, like the British East India Company, soon found it necessary to assume the position of a governing power, and treated accordingly with the native princes, with whom they were frequently at war. In 1811 Java was taken from the Dutch by the British, who, however, restored it after the Peace of 1816, since which time it has remained in their hands. Up till 1825 various portions of the island were still under native princes, who paid tribute to Holland; but in that year a revolt took place, which resulted in the whole island falling under the Dutch sway; although two provinces have been left, but only nominally, under the government of Javanese princes—Surakarta and Jokjokarta. Both princes have a court, nobles, ministers, etc., but are the mere instruments of the Dutch government, by whom they are allowed handsome pensions. Since the close of this war the island has been rapidly increasing in population and prosperity. On 20 Sept. 1859 the Dutch legislature totally abolished slavery in Java. The natives never had slaves, and there never were but a few thousand on the island.

Language and Literature.— It is not certain whether the name of Java be connected with the Sanskrit Javana and Yavana, both of which, beside being related to Ἰωνία as names of Greece, also signify (especially the latter) Bactria, Arabia, and other foreign countries, and, moreover, swift, horse, etc.; or whether its etymon be of a different origin. As regards the affinities of the Javanese language, Roorda considers it as a branch of the Malay. Crawfurd derives it from the vernacular of the aborigines, to whom he attributes the primitive culture of the Malayan islands. Domeny de Rienzi supposes it to have arisen from the language of the Bugis of Celebes, by an admixture of Malay and Sanskrit. Humboldt connects it, both as to words and grammar, with the Tagala, the most developed Malayan tongue of the Philippine Islands, as well as with other Malay idioms and with Sanskrit. Others see in it a type of the unmixed tribes of Oceania. It certainly shows all these affinities, and contains also some Arabic elements. The Javanese is the most cultivated of all Polynesian languages, owing to the very early intercourse of the island with the continent of India, whose Aryan as well as Dravidan influence is attested by the presence of Malabaric words along with those from the Sanskrit, not only in Javanese, but also in the idioms of Sumatra, Madagascar, etc. Both religious and political revolutions have served to modify the condition of the languages. There are four dialects, according to Raffles, on the three islands which form the linguistic group in question, namely: (1) The tongue of the mountaineers of Sunda, in the western part of Java, east of Tagal, probably vernacular through this whole region before the introduction of Mohammedanism, now spoken by about one tenth of the population of the island; it contains many Malay and some Sanskrit words, stands in the same relation to the principal language as the Welsh does to the English, and is best spoken at Bantam, sluggishly at Bogor and Chianjore, and verging to the Javanese at Cheribon. (2) The Javanese proper, east of the last named city, extending through the rest of the island, especially along its north shore; its words are long at Tagal, shorter at Samarang, full, short, and strong at the courts of Sura-

karta in the centre, and Jokjokarta in the south; it approaches the Madurese at Surabaya, and the Balian at Banyu-Vangi. (3) The dialect of Madura and Sumanap, which has many Sunda words, with more of Malay, and with peculiar endings. (4) That of Bali, little different from the general Javanese. This island preserves the ancient letters as well as Brahminism, both expelled from Java in the 15th century. A sort of jargon, analogous to the *lingua franca,* is spoken at Batavia, being a medley of Dutch, Portuguese, Javanese, and Malay. Along with the preceding there are also peculiar styles or idioms of speech, varying in accordance with social position and age, as the *madhjo* (intermediate), between equals; the *bása* or *bohoso-ngoko* (language popular), to inferiors; the *bása-kramo* (language superior), urbane, court idiom, about three fourths of it Sanskrit, used by poets as the speech of gods, heroes, and ghosts. As to locality, there are also two vernacular idioms, namely, the *bása-dalam* of the interior, and the *bása-luar,* spoken along the shores. The Kavi (learned, wise, poet) is the ancient sacred language of Java, and consists of about six parts of Sanskrit, less altered than in the Pali, to four of Javano-Malay. It owes its origin to Brahminic immigration, about the beginning of our era. It is to the Javanese what Sanskrit is to the Hindostanee, and Pali to the Indo-Chinese languages. Declining in the 14th century, it took refuge in Bali, and was imperfectly known by the Panambahan at Sumanap at the time when Raffles was in Java. Passages in the Kavi are sometimes quoted on peculiar occasions, as for instance in fables and dramas; the term itself is employed as a title of works, etc., such as *Sekar-kavi,* flowers of poetry, whence *Sckarini,* a Kavi metre; *Rama-kavi,* the Javanese Ramayana; *Kavindhra,* principal singer or poet (named *ma-kathā,* narrator, in Tagala). A few specimens of words may show the relation of the Javanese to the common Malay, where the difference, if not specially noted, is sometimes more in the accent than otherwise: *langit,* heaven; *tanah,* earth (Mal. also *benua,* region); *ayer* (Jav. also *banyu*), water; *laut* (Jav. *lahut*), sea; *dhina,* (Mal. *hāri*), day; *bengi* (Mal. *mālam*), night; *vūlan* (Mal. *būlan*), moon; *terang* (Mal. *trang*), light; *mati,* to die; *lulat* (Mal. *kāsih*), to love; *dara,* virgin; *dhēva* (Mal. *tuhan*), god, lord; *mangan* (Mal. *mākan, santap*), to eat; *bāpa, pak* (Mal. *pā,* politely *ayah*), father; *ma, bok* (Mal. *mā, amā,* politely *ibu, bonda*), mother, etc. Compounds and derivatives abound, but the latter are more frequently formed by suffixes than by prefixes, in which the Tagala is very rich. There are many contractions into *tr, ngl, ngr,* with the dropping of short vowels, together with the alteration of the initial sound (similarly to the Celtic), and other variations which obscure the etymic origin, thus: Sans. *nātha,* master, lord, becomes *tata,* order, to reign; Jav. *neda,* to eat, *teda,* food; *nulis,* to write, *tulis,* scripture; *nitik,* to prove, *titik,* proof. The prefix *n* denotes verbs, *t* substantives; other changes are: *nyatur,* to tell, *chatur,* tale; *nyerrat,* to write, *serrat,* writing, etc. The doubling of the first syllable makes verbs, as *tutulung,* to help, from *tulung,* aid; *gagriya,* to dwell, from *griya,* house. The insertion of *in* is the sign of the passive voice. Substantives are also made by prefixing *pem* (*pen, pe*), denoting an agent; thus: *pem-pekto,* carrier, from *pekto,* to carry; *pen-dahar,* eater, etc.; by prefixing *ka,* a sign of the past participle; *ka-bekto,* Lat. *allatum;* by suffixing *n* (*en, an*): *bakt-en,* the carrying, *dahar-an,* Lat. *cibus;* and by both prefix and suffix: *ka-dahar-an,* an eatable. Articles, gender, and the dual number are wanting. In the plural, cases are denoted by particles, and also by reduplication, as in the Japanese. The genitive relation is shown by the precedence of the noun or by inserting *ing.* The other relations of case are indicated by means of verbs. The adjective is unchanged after the substantive. Pronominal forms are fewer than in Malay: *kita,* we in Malay, means I in Javanese. The numerals are: (1) *sidshi,* (2) *loro,* (3) *telu,* (4) *papat,* (5) *limo,* (6) *nem,* (7) *pitu,* (8) *volu,* (9) *songngo,* (10) *sepuluh,* (11) *savelas,* (12) *volas,* etc. Ordinals are formed by prefixing *ping* or *kaping.* The figures of numbers are modified letters. The person, number, tense, mood, and voice of verbs are indicated by certain particles. Many verbs and nouns are expressed by the same word, others are distinguished as stated above. The suffixes of the imperative are *o, ono, en, enno.* The following are examples of a verb in various forms: *ningngalli,* to see; passive, *dhipun, tingngalli, katingallan,* etc.; *kula, tingngalli,* I have seen; *badē kula tingngalli,* I shall see; *tinningngallam,* to see one another; *sampeyan tingngalli,* see; *kula tingngallana,* that I may see, etc. The construction is as follows:

Rama kahula kang vonten ing surga, vasta andika dadi Father our who art in heaven, name thy be *elapienno.* hallowed.

As regards the shape and employment of letters, the graphic system is derived from the Devanagari, but not as regards their order, which is as follows: *'ha, na, tcha, ra, ka, ḍa, ṭa, sa, va, la, pa, da, dja, ya, yya, ma, ga, ba, ṭa, ng'a.* These 20 *Akshara* (letters) are consonants with an adherent *a* in the general language, or *o* at the courts of princes, which, when not suppressed, gives to the syllabarium the epithet of *lagana.* As many *Pasangan* (consonants) are vowelless, three of them are annexed, the others subscribed to other letters. This peculiar succession of letters must have originated prior to that of the organic scheme of the Devanagari, and it is explained by its signifying: "There were two messengers, disputing, equally courageous, till both died." The *Akshara-Buddha,* being ancient, differ in form from the later *Aksharagede.* Some Kavi letters are almost like those of the Sanskrit, while the more recent resemble the square Pali. The vowels are called *Sandang'an* (connection), namely, *a, i, u, ē, ĕ* (almost French *muet*), *o,* either used as initials or (except *a*) attached to the consonants instead of the inherent *a.* The diacritic signs are analogous to those of the Devanagari. There are also characters for the quasi-vowels *le* and *re.* The writing runs from left to right, each letter being connected with the others in words, and these following one another without any space left between them. Tradition assigns the introduction of writing as well as of Brahminism

and political institutions to Aji Saya Baya. Palæography finds a rich harvest in Java, its subjects being distributed in four classes: (1) inscriptions in ancient Devanagari near the ruins of Brambanan and Sinagasari; (2) those in square Kavi letters, from which the cursive are derived, mostly on stone and metal; (3) those in a dialect resembling the language of Sunda; (4) the *Chandra-Sangkala* (light of royal times or dates), which consist in selecting such words, symbolic of numbers, as may also express a fact that is to be recorded. Thus, for instance, the date of the destruction of Majapahit, a fact most important in Javanese history, is thus inscribed (1400, reading from right to left):

Sirna (0) *ilang* (0) *kertāning* (4) *bumi* (1)
Lost and gone (is) (the) work, (pride of the) earth (land.)

The date of certain long graves at Gresik, near the tomb of the princess of Chermai (1313), is thus written:

Kāya (3) *vulan* (1) *pūtri* (3) *iku* (1).
Like (to the) moon princess (that) was.

The literature, which is in Kavi, dates from about the commencement of our era, and is rich, especially in legends concerning cosmogony. The subjects of the works are mostly either of a mythical or ethical character. Prominent among the former are: the *Kānda* (Sans. *Khandata*, fragment, section) *Pepakem* (book), or *Sejarah* (history); *Manek-Maya*, a mythical genesis, in which Buddhism predominates; *Vivaha-Kavi* (matrimonial poem), about a *Rasaksa* (evil spirit) who courts a *Vidaduri* (nymph); *Rama-Kavi*, the Javanese *Ramayana; Parikespit*, "Arjuna's Grandson;" *Mintaraga*, a poem on Arjuna in the Indra mountain. This kind of composition comes down to the time of Aji Saya Baya. Of the ethical order are the *Niti Sastra Kavi*, in the purest style, of about the 13th century; and *Srūti*, which already alludes to Islam. But the *Brata Yudha* ("Holy War") is an epos mostly on the deeds of Arjuna; being an episode of the Mahabharata, in 712 stanzas, with varying rhymes. The *Sastra Menava* is a Javanese imitation of the ordinances of the Indian Menu. Indeed, most of the Kavi works are such imitations. Whether mere versions of Sanskrit works have been made or still exist is not precisely known; but there are many Javanese versions from the Kavi. Javanese literature abounds in romantic compositions, mostly of elegiac form. Among these, the adventures of the popular hero Pandji are most prominent. Dramas, and especially puppet shows, called *vayang* (shadows), and with figures of either leather or wood personating heroes, are popular.

Java Fowls. See POULTRY.

Java Sea, a body of water with Borneo on the north, Celebes on the east, the island of Java on the south, and Sumatra on the west. It borders on a number of other islands, all small. The direct route from Singapore to Australia is through Java Sea; and it is crossed by two approved routes to China, one by Pitt's Passage and the other through the Straits of Macassar.

Java Sparrow, a species of Oriental weaver-bird (*Munia oryzivora*), called rice-bird or paddy-bird by the British in India and China, where it has become naturalized from its original home in Java. It has a poor song but is kept in cages for its beauty and liveliness, and is sold by bird-dealers all over the world. Its colors are slate-blue and black, with conspicuous white cheeks and a swollen rosy bill.

Javary, zhä-vä-rē', a river which has its rise in the northwestern part of Bolivia, flows northwest, then north and northeast into the Amazon River. The greater part of its course of 350 miles, it forms the boundary line between Brazil and Peru. It is navigable from the mouth to the Anahuacas Mountains. By treaty between the governments of Brazil and Bolivia, the source of the Javary is the demarkation of the boundary line between the countries.

Jav'elin, a short and light spear thrown from the hand, and in ancient warfare used by both horse and foot soldiers. The *pilum* of the Romans was a weapon of this description, and was used either to throw or to thrust with. The shaft was 4½ feet long, and the barbed iron head was of equal length, but as it extended half way up the shaft, the whole length of the weapon was nearly 7 feet. The shaft, made of some tough wood, often cornel, was an inch in diameter. The use of the javelin was not confined to the Roman legionaries, for many barbarous tribes, and especially the Goths, employed this weapon in their military operations.

Jaws, Anatomy of the. The upper jaw is formed by the union of the two superior maxillæ; these bones each form part of the cheek, the outer wall of the nasal cavity, the hard palate, and the lower part of the eye-socket. The lower jaw is formed of one bone, the inferior maxilla, which presents a horseshoe-shaped body, and vertical plates of bone ascending from the body posteriorly. The top of these vertical plates is widened into a knob-like end for articulation with the skull.

Dislocation of the jaw may take place during excessive laughter or yawning. The articular knob slips forward and the jaw is held open. Reposition is accomplished by placing the thumbs on the back teeth and making forcible downward and slightly backward pressure until the bone is felt to snap into place.

Fracture of the upper jaw is uncommon except when the face is crushed in. Usually in fracture it is the body of the lower jaw near the front that is broken. Besides the usual signs of fracture (q.v.) the attitude may be character-

istic; the patient is unable to shut the jaw; and the difference in the line of the teeth may show clearly. Repair of the fracture is facilitated by fastening the upper jaw with a sling-bandage carried around the head, and keeping it so fastened until union is established. During this time the patient is forced to eat liquid foods almost entirely.

Jay, John, American statesman and jurist: b. New York 12 Dec. 1745; d. Bedford, Westchester County, N. Y., 17 May 1829. His father was a wealthy merchant of Huguenot stock, and his mother a daughter of Jacobus Van Cortlandt. His father,— early discovering, to use his own words, that Jay was of "a very grave disposition, and took to learning exceedingly well"— sent him to a school in New Rochelle something like Dotheboys Hall in 'Nicholas Nickleby.' Three years at school were followed by study under a tutor until he entered King's College at 14. He was graduated in 1764, the subject of his oration being the blessings of peace, of which he was to have still keener appreciation. Two weeks later, on payment of £200, he entered the office of Benjamin Kissam, a prominent lawyer of New York, as an apprentice bound to serve five years, the last two years to be devoted to the study of the law. Admitted to the bar in 1768, he soon attained prominence in the profession, forming a partnership with Robert R. Livingston, afterward chancellor of the state, and secretary of foreign affairs. In 1773 he began his public career, as secretary to the Royal Commission to determine the boundary between New York and Canada; and for the following 28 years his public services were constant, varied and of supreme importance to the country so fortunate in being his birthplace. All his duties in the many fields covered by him during his splendidly successful life were performed in a manner indefatigable, zealous and faithful, and with marked ability.

Bound by no ancestral ties to England, and having married in 1774 a daughter of the famous Whig, and Revolutionary Governor of New Jersey, William Livingston, many would suppose that in the conflict impending between the colonies and mother country, Jay's voice, like those of James Otis and Samuel Adams, would have been from the first "still for war." But he was constitutionally so calm and conservative that he was unwilling to be too precipitate in determining upon a change in the mode of government. When, however, the colonists decided that their only safety lay in separation, Jay was found to be as staunch and aggressive a patriot as any, and represented the citizens of New York on the committee to settle the question arising out of the Boston Port Bill. Jay drafted the suggestion of that committee that "a Congress of Deputies from the Colonies in general" be convoked — in fact, the convocation of the Continental Congress. He was a member of that congress, and met with it in Philadelphia on 5 Sept. 1774. Congress at once appointed a committee to "state the rights of the colonies in general," of which Jay was made a member. This committee designated him to draft an address to the people of Great Britain, which was so satisfactory that it was at once reported to Congress, and adopted by it. Jefferson, without knowing who was the author, pronounced it "a production certainly of the finest pen in America."

Jay was also sent to the 2d Continental Congress, but in the interim devoted himself to shaping the public mind in the direction of obedience to Congress and in hostility to enforcement of Parliamentary taxation. When the 2d Congress convened, the signal shot — "heard round the world" — had been fired at Lexington, and Congress, realizing that a condition of war existed, deputed Jay to draft an address to the people of Canada, which was prepared and adopted, and circulated in that country. He also wrote an address to the people of Jamaica and Ireland by request of Congress, but the second petition to the King that he prevailed upon Congress to make was written by Dickinson. Other important and effective work by him in that general direction might be cited, but I shall be content with the assertion I deem supported by the facts, that as a creator and molder of public opinion at that particular juncture Jay stands unrivalled; and all this was in the main accomplished through the wise use of his pen, the efficacy of which was strongly presented by John Adams when he wrote regarding it to Jefferson, "I never bestowed much attention to any of those addresses, which were all but repetitions of the same things; the same facts and arguments; dress and ornaments rather than body, soul or substance. I was in great error, no doubt, and am ashamed to confess it, for these things were necessary to give popularity to the cause, both at home and abroad." Jay's contribution to the debates in Congress, like all his public work, showed that he followed in all things and upon all questions the path illuminated by the light of his well balanced judgment, and his conscience, thinking not of personal popularity, but simply of the right. He served actively upon the committee that carried on negotiations with foreign powers friendly to America and inimical to England. Indeed, during the year 1775 he was a member of so many committees, each having different and important objects, that it is difficult to understand how he was able to accomplish so much important and laborious work.

If it be asked why so good a patriot as Jay was not a signer of the Declaration of Independence, the answer is, that in 1776, while a member of the Continental Congress, Jay was also elected to the New York Provincial Congress, and the Continental Congress having directed the colonies to each adopt a government, Jay, on the call of his colony, proceeded to New York to take part in the formation of the local government, where he was forced to remain while the Declaration of Independence was being signed. During 1777, and while the war was going on in the vicinity of New York, the Provincial Congress, then styled the Convention of the Representatives of the State of New York, was laboring with exceeding difficulty, the members, as is recorded, performing "all the various and arduous duties of legislators, soldiers, negotiators, committees of safety and ways and means, judges, juries, fathers and guardians of their own families, flying before the enemy, and then protectors of a beloved commonwealth." Yet amid all this turmoil and unrest a constitution was drafted by Jay which was, in the main, adopted as drafted, and was published upon 22 April 1777, by being read in front of

the court-house in Kingston. A committee was at once appointed, Jay being a member, to organize a new government; and a council of safety was created to act until the legislature should meet. Robert R. Livingston was appointed chancellor and Jay chief justice, and the judicial department of government was temporarily organized.

Jay was urged to be a candidate for governor at the first election under the Constitution, but declined. General Clinton was elected over his opponent, General Schuyler, and took the oath of office, it is said, while "clothed in the uniform of the service, standing on the top of a barrel in front of the Court-House in Kingston." On 9 September following, Chief Justice Jay delivered an address to the grand jury at Kingston, which is to be found in the first volume of his correspondence and public papers. The address is a much prized document of revolutionary times, and was, undoubtedly, intended to reach and affect a much larger constituency than the grand jury to whom it was delivered. Of course, in those unsettled days, with the struggle between the old and the new countries raging, but little litigation of importance came before the supreme court, so that during Jay's chief justiceship the work of the court was mainly confined to criminal trials, and the court never sat in banc. During 1778 he was active in the Council of Revision, of which he was a member ex-officio. The legislature in 1779 appointed Jay to Congress without requiring him to vacate the office of chief justice, it being resolved that owing to serious questions between certain States "a special case" obtained under the Constitution. Shortly afterward Congress elected him its president. Later in the year, however, he resigned the office of chief justice, designing, he said, to recoup his failing fortunes. But his desires in that direction were not to be gratified. More than 20 years elapsed before the public he had served so well would submit to be deprived of his services.

In October, 1779, Jay resigned the presidency of Congress to accept the office of minister to Spain. His instructions in part were to secure if possible a commercial treaty with Spain similar to that existing with France, to acquire a port in Spanish dominion on the Mississippi, and to negotiate a loan of $5,000,000. That his mission was not entirely successful, and was personally disagreeable, was due to the fact that Spain disliked the new nation because it occupied lands formerly held by Spain, and it was apprehended that with increasing strength it might reach out and take more — fears that we know now were not groundless. While minister to Spain, Jay was appointed, with Franklin, Jefferson, Adams, and Laurens, commissioner for a general peace. Their instructions rested on the mistaken theory that France would aid in procuring for us the best possible terms. In June, 1782, Jay joined Franklin, then minister to France, in Paris, and promptly but cautiously entered upon an investigation which disclosed that France had other interests to serve than those of the United States. Possessed of the situation, he boldly entered upon negotiations with England's representative without even consulting his only colleague in Paris, whom he regarded as necessarily embarrassed by his position as minister to France, and his instructions. With firmness, and yet with great tact, he conducted the negotiations alone until joined by Adams, who enthusiastically approved of his action, and so advised Mr. Franklin, who, after consultation, agreed that the negotiations should be concluded without consulting the French court. The result of these most interesting negotiations with England was a treaty by which the United States gained more than Congress had ever ventured to propose. And Jay's part in this great triumph of diplomacy is well summed up in a letter written by his fellow commissioner John Adams to Jonathan Jackson, "a man and his office were never better united than Mr. Jay and the commission for peace. Had he been detained at Madrid, as I was in Holland, and all left to Franklin, as was wished, all would have been lost." When he returned New York gave him the freedom of the city in a gold box, and he found that he had been appointed by Congress secretary of foreign affairs. This office he filled with his usual ability, settling international questions, and advocating the building of a navy, and the organization of a federal government under a constitution. His papers in the 'Federalist' evidence both his activity and forcefulness in this direction, and his influence contributed in no small degree in bringing New York to the support of the Federal Constitution.

It is said that after the first election of Washington to the presidency he offered Jay the choice of any office in the government, and that he chose that of chief justice of the Supreme Court of the United States, which he justly regarded as the most exalted position next to the presidency; but be that as it may, Washington appointed him to that position, and in his letter to Jay, advising him of the nomination, said, "I not only acted in conformity with my best judgment, but I trust I did a grateful thing to the good citizens of these United States." The opportunity to contribute largely toward the development of the law in this country did not come to him, however. Had it, his success in other fields and his well poised mind assure us that Washington's judgment would have been triumphantly vindicated. Only a few causes came before the court during his incumbency, and the record of those, with a single exception, are preserved only in the minutes of the clerk, but his every step was in the right direction, whether taken while holding a circuit or sitting in banc with associates, and had effect in shaping the foreign policy of the United States as well as in establishing the dignity and independence of the Federal judiciary. He continued to hold the office until he resigned in 1795; but in the meantime and in 1792 the Federalists supported him unsuccessfully as against Governor Clinton for the governorship of New York, and in 1794 President Washington urged him to go to Great Britain as special envoy to settle differences growing out of the failure of that country to keep the obligations of the Treaty of 1784; differences which had aroused a strong war spirit all over the land. It was easy to foresee, as Jay forsaw, that the outcome of the situation would in all probability be unpopular with the people, but he did not hesitate to meet the responsibility that Washington believed he could meet better than any other man, partially because of the reputation he had established in England while negotiating the Treaty of Peace of 1784. A treaty

Copyright by C. E. Anderson, Sec'y, 1901.

JOHN JAY,

CHIEF JUSTICE OF THE UNITED STATES SUPREME COURT, 1789-1795.

resulted, known on this side of the ocean as "Jay's Treaty," which settled the eastern boundary of Maine, recovered for illegal captures by British cruisers $10,000,000, secured the surrender of the Western forts still garrisoned by the British, and contained an article about the West India trade. With the exception of the latter article the treaty was approved by the President and ratified by the Senate. But many were not satisfied, and they denounced him with tongue and pen, and even burned him in effigy in Boston, Philadelphia and at his own home, New York. How different was the homecoming from that after the negotiation of the other treaty, when the freedom of the city was presented to him in a gold box, and each one seemed to vie with every other in extending a welcome. In a letter to a friend, Jay said at that time, "Calumny is seldom durable, it will in time yield to truth"; and he bore himself at that time as one having full confidence that he had acted both wisely and skilfully, and expected the people to realize it in time.

He found on his return that he had been elected governor of New York — before the public had knowledge of the terms of the treaty, of course. Before the close of that term, and in April 1799 he was re-elected by a majority so large as to constitute a personal triumph. During this term the statute was passed providing for the gradual emancipation of slaves within the State, then numbering about 22,000. The six years of his incumbency of the office of governor were crowded with interesting legislative and executive events in which he performed his part with that staunch devotion to the public interests which ever characterized his efforts throughout his career as a servant of the public, as is well illustrated by his refusal to be a party to the scheme of certain leaders of the Federalists to secure the electoral vote of New York for the ensuing election. The unexpected result of the spring elections of 1800 assured the Republicans of a substantial working majority on joint ballot, and hence of the Presidential electors under the law as it then stood. It was generally conceded that New York would determine the choice of the next President. Although the Federalists had, in March prior to the elections, defeated the attempt of the Republicans to redistrict the State, and had insisted that it was necessary that the State should act as a unit in the choice of Presidential electors, the leaders changed their position after the election had gone against them, and insisted that the electors should be chosen by districts. Alexander Hamilton wrote Governor Jay on 7 May advising that he call an extra session of the Legislature to enact such a statute before July first, the end of the legislative year. Philip Schuyler also wrote a letter strongly urging that such a course furnished the only means of saving the "nation from more disasters." But Jay, although a staunch Federalist, who had received the votes of New Jersey and Delaware, five votes from Connecticut and one from Rhode Island for the Presidency in the preceding electoral college, refused to take such action, and endorsed on Hamilton's letter these words: "Proposing a measure for party purposes which I think it would not become me to adopt." He refused a renomination for the office of governor on the ground that he now intended to retire from public life, and his purpose was unshaken by President Adams announcing to him his nomination and confirmation a second time as chief justice of the United States.

For 28 years he had been a good and faithful public servant. To him indeed had public office been a public trust, in which he had toiled faithfully and intelligently, having only in view his duty and the public good, unmoved by desire for great emolument or popularity. Naturally conservative he carefully examined every situation before acting, but when he had determined the proper course to take he acted promptly and boldly, and without regard to the effect of his course upon himself. His perfect self poise had its effect upon associates and subordinates, and the value he placed upon it may be inferred from his letter of instructions to William Carmichael in which he said, "Command yourself under every circumstance; on the one hand avoid being suspected of servility, and on the other let your temper be always even and your attention unremitted." This great patriot gave to the public service the day of his vigorous manhood, the best years of his life, covering the period of the struggle for independence and the formation of our complex system of government, the years when his country most needed the faithful service of her sons. He set aside every personal interest, laboring with fidelity and unselfish effort, and showing himself willing to "spend and be spent" for his country. Having borne his portion of travail at the birth, and done his part in the nurture of the early infancy of this great nation, he retired at last to his farm at Bedford, Westchester County, where he lived a restful life, indulging his agricultural, philanthropic and religious tastes, and enjoying the confidence, esteem and affection of the people until he went to his last rest at the age of 84 years, leaving behind him

> "A name that shall live through all coming time,
> Unbounded by country, by language, or clime."

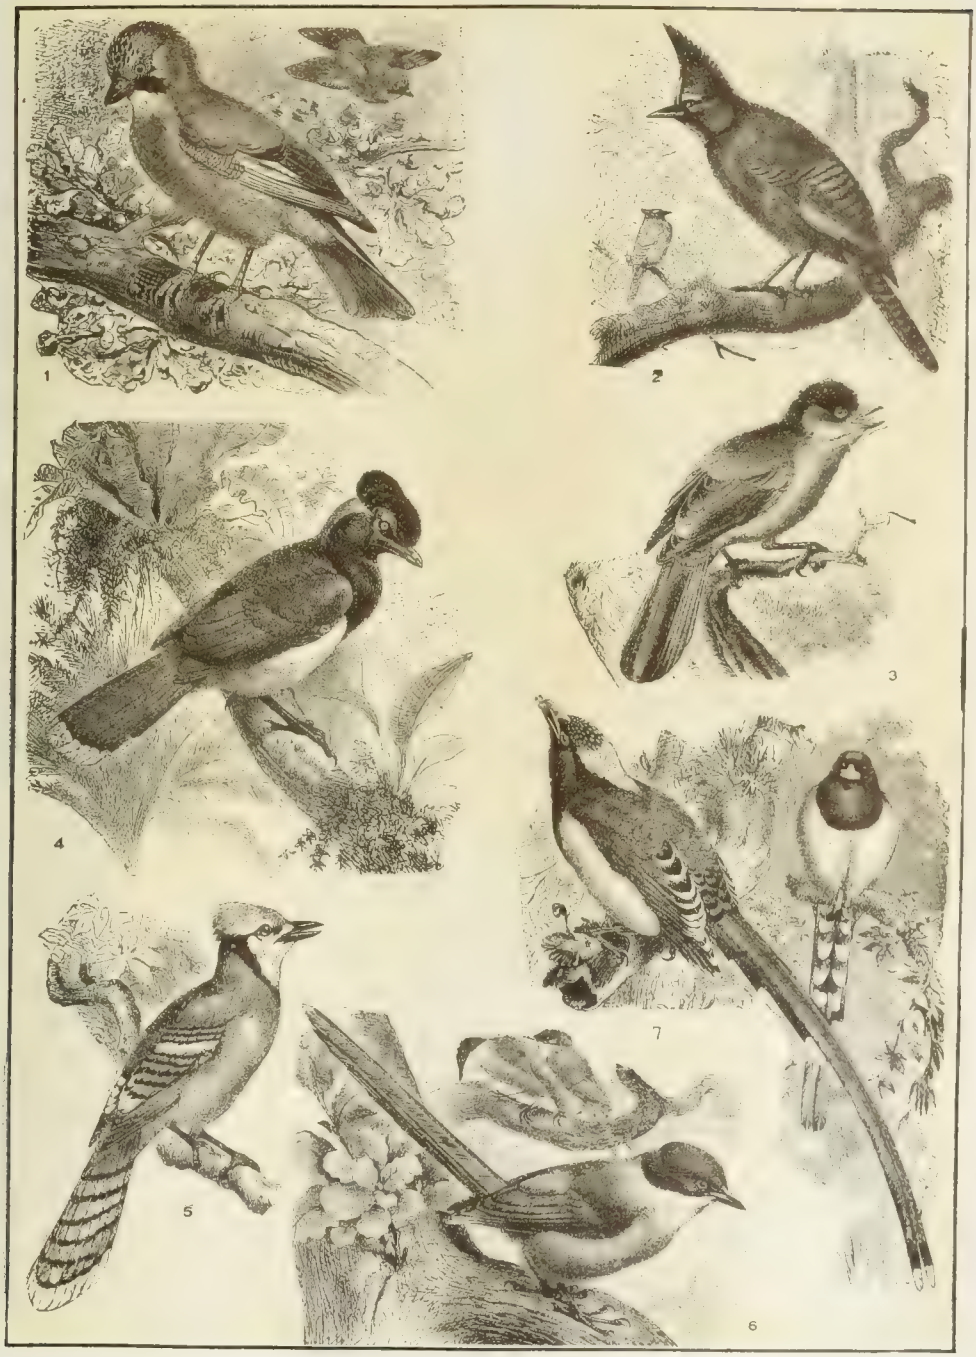
Alton B. Parker,
Late Chief Judge of the Court of Appeals of the State of New York.

Jay, John, American diplomatist: b. New York, 23 June 1817; d. there 5 May 1894. He was the son of William Jay (q.v.) He was graduated from Columbia in 1836, studied law in New York, was admitted to the bar in 1839, became a prominent opponent of slavery, was secretary of the Irish relief committee in 1847, and was counsel for several fugitive slaves. He organized the meetings at the Broadway Tabernacle, New York, in 1854, and took a leading part in the organization of the Republican party at Syracuse 27 Sept. 1855. From 1869 until his resignation in 1875 he was United States minister to Australia, in 1877 was appointed chairman of the so-called Jay commission for the investigation of the New York customs-house administration, and in 1883 was appointed the Republican member of the New York State civil service commission. He was long corresponding secretary of the New York Historical Society, and published several pamphlets, among them: 'The Dignity of the Abolition Cause' (1839); and 'The American Church and the American Slave-trade' (1860).

Jay, William, English Congregational clergyman and writer: b. Tisbury, Wiltshire, 8 May 1769; d. Bath, 27 Dec. 1853. After studying for the Congregational ministry, he officiated at Hope chapel, near Bristol, and became pastor in 1789 of Argyle chapel, Bath, where he remained till 1852. As a preacher he not only enjoyed a high celebrity in his own denomination, but won the applause of critics like John Foster, Sheridan, and Beckford. His published sermons are esteemed as well for their catholic spirit as their practical earnestness and simplicity of style. They have passed through many editions, and besides them he wrote 'Essay on Marriage'; 'Lectures on Female Scripture Characters' (1854); 'Morning and Evening Exercises' (1854). His autobiography, in the form of letters, appeared in 1854.



Jay, William, American jurist: b. New York, 16 June 1789; d. Bedford, N. Y., 14 Oct. 1858. He was the son of John Jay, statesman and jurist (q.v.). Graduated from Yale in 1808, he studied law with J. B. Henry at Albany, was obliged by defective eyesight to withdraw from the profession, and became interested in various philanthropic movements, including the anti-slavery cause. He was a founder of the American Bible Society (1816), which he greatly promoted and long defended against High Church attacks led by Bishop Hobart. In 1818–21 he was judge of common pleas in New York, and in 1835–7 corresponding foreign secretary of the American Anti-Slavery Society, in the drafting of whose constitution he had assisted. He wrote much on anti-slavery, and was recognized as a leader of the more conservative of the Abolitionists. Among his publications were: 'The Life and Writings of John Jay' (1833); 'An Inquiry into the Character and Tendency of the American Colonization and American Anti-Slavery Societies' (1834): 'A View of the Action of the Federal Government in Behalf of Slavery' (1837); 'War and Peace' (1848).

Jayhawker, a name originating in Kansas during the slavery and anti-slavery warfare; applied to a few Free State men who organized a system of retaliation against pro-slavery outrages. Gov. Lane of Kansas, in 1861, declared that "the people of Kansas were neither thieves, plunderers, nor *jayhawkers.*"

Jays, a group of birds forming with the magpies a sub-family (*Garrulinæ*) of the *Corvidæ,* or crow family. They are readily distinguished from the true crows (*Corvinæ*) by their relatively short wings, long conspicuous tails, and usually showy plumage, in which blue colors are prominent. They are generally smaller than the crows, have weaker bills, and feet better adapted to the more completely arboreal life which they lead. Jays are found throughout the greater part of the world, but America leads in number and variety of species. North America has four genera and ten species with many additional local varieties. A familiar representative is the bluejay (*Cyanocitta cristata*), which is numerous throughout the eastern half of the United States and Canada. It is about one foot long, of which the tail is nearly half; the head conspicuously crested; purplish-blue above with a slight tinge of the same color on the generally gray underparts; the wings and tail are a nearly saturated blue in the males, duller in the females, cross-barred with black and with white markings especially conspicuous on the end of the tail; a rich black collar encircles the neck. The bluejay eats all kinds of nuts, fruits, large insects, and at times the eggs and young of other birds; it seldom leaves the trees in search of food, and when on the ground hops instead of walking like the crow. Except in Canada it is resident, and it breeds throughout its entire range. The nest, a large structure of twigs, grass, leaves, etc., is built in trees, bushes, or old buildings. Five is the usual number of eggs. Like the magpie this jay is known to collect and hoard various glittering or brightly colored objects, but is chiefly noteworthy on account of the variety and quality of its notes which range from the harshest cries to full flute-like tones. On the Pacific Coast this species is replaced by the darker and duller Steller's jay (*C. stelleri*). The Canada jay, or whiskey jack (*Perisoreus canadensis*) is, as its name indicates, a northern bird, found within the United States only along the northern border, and occasionally breeding in northern Maine. This is a dull-colored gray bird, without a crest, and with soft, lax plumage. It is well known to hunters and lumbermen whose camps it haunts with great boldness; and in manners and voice resembles the bluejay. It nests very early in the spring. Related species are the Oregon jay (*P. obscurus*) and the Siberian jay (*P. infaustus*) of boreal Eurasia. Several species of crestless deep-blue "Florida" jays (*Aphelocoma*) inhabit Florida and the west and the southwest. The brilliant green jay (*Xanthura luxuriosa*) is an example of the gorgeous tropical jays which just enter the United States in Texas. Consult the works: Wilson, Audubon, Nuttall and American ornithologists generally; for western species in particular, Coues, 'Birds of the Northwest' (1874), and 'Birds of the Colorado Valley' (1878).

Jay's Treaty, 1794. The Articles of Confederation provided that the States might nullify at will any provisions of whatever commercial treaty Congress might negotiate; of course therefore no nation with much commerce to be disturbed by our competition would make such treaties with us. Our chief commerce was with Great Britain; and that country would make no commercial treaty whatever with us, even for years after the Constitution had given Congress power to enforce its treaties. There were two main reasons for this: first, that Great Britain had valuable commercial monopolies (especially in the West Indies) for which she thought we could return no equivalent; second, she was angry over the *sequelæ* of the peace of 1783. She had agreed to surrender the border forts on the Great Lakes, the St. Lawrence, and Lake Champlain, and carry off no negroes, on condition that Congress "recommend" to the States to restore confiscated Tory property, and agree to confiscate no more. Congress did so twice emphatically, but the States paid no attention to it; the British government, though it knew very well how much the recommendation meant, made this an excuse to retain the forts and refuse payment for 3,000 negroes carried off; this in turn hardened the States to refuse compliance with the treaty, and the forts being

THE JAY FAMILY.

1. European Jay (Garrulus glandarius).
2. Mexican Long-crested Jay (Cyanocitta diademata).
3. Canada Jay (Perisoreus canadensis).
4. Blue-capped Jay (Cyanocorax chrysops).
5. American Bluejay (Cyanocitta cristata).
6. Spanish Jay (Cyanopica cooki).
7. Red-billed Jay (Cissa erythrorhyncha).

made a basis for Indian outrages winked at by the British commandants enraged the country still more. The Republicans, who sympathized with the new French Republic and hated Great Britain, held the House; the Federalists, whose sympathies were exactly opposite, the Senate by a small majority. On 16 Dec. 1793, Jefferson made a famous report on a House resolution, recommending retaliatory duties; and after an acrid debate the Republicans pushed through a non-intercourse resolution, only defeated even in the Senate by Vice-President Adams' casting vote. But Washington threw his weight into the scale of peace, and nominated Chief Justice John Jay as envoy extraordinary to negotiate a commercial treaty. With Lord Granville he drew up one on 19 Nov. 1794, which removed the chief American grievance by surrendering the forts, but refused compensation for the negroes and referred all other claims to commissioners; and as to commerce, allowed direct but not coasting trade between the United States and the British East and West Indies (the latter in vessels of not over 70 tons), but denied the United States the right to export sugar, molasses, coffee, cocoa, or cotton to Europe — in other words, to become an intermediary for the British colonies to evade the British commercial monopoly; and limited even this provision to two years after peace with the powers then at war with Great Britain. There were also clauses which impliedly recognized British right of search and impressment, and power to make anything contraband. The treaty was ratified by the Senate in secret session (8 June 1795), but when published excited an uproar of public indignation; Jay was burned in effigy, and even Washington vilified incredibly. The Virginia legislature and the Federal House practically passed votes of censure; but the people gradually came to recognize that it was the best thing to be had, hard as were the terms; the commercial bodies in the States openly commended it; Hamilton wrote his "Camillus" letters in its favor; and after a bitter struggle for many weeks in the House to refuse compliance with the Senate action, the treaty won by 51 to 48.

Jean Paul. See RICHTER, JEAN PAUL FRIEDRICH.

Jeanne d'Arc, zhän därk. See JOAN OF ARC.

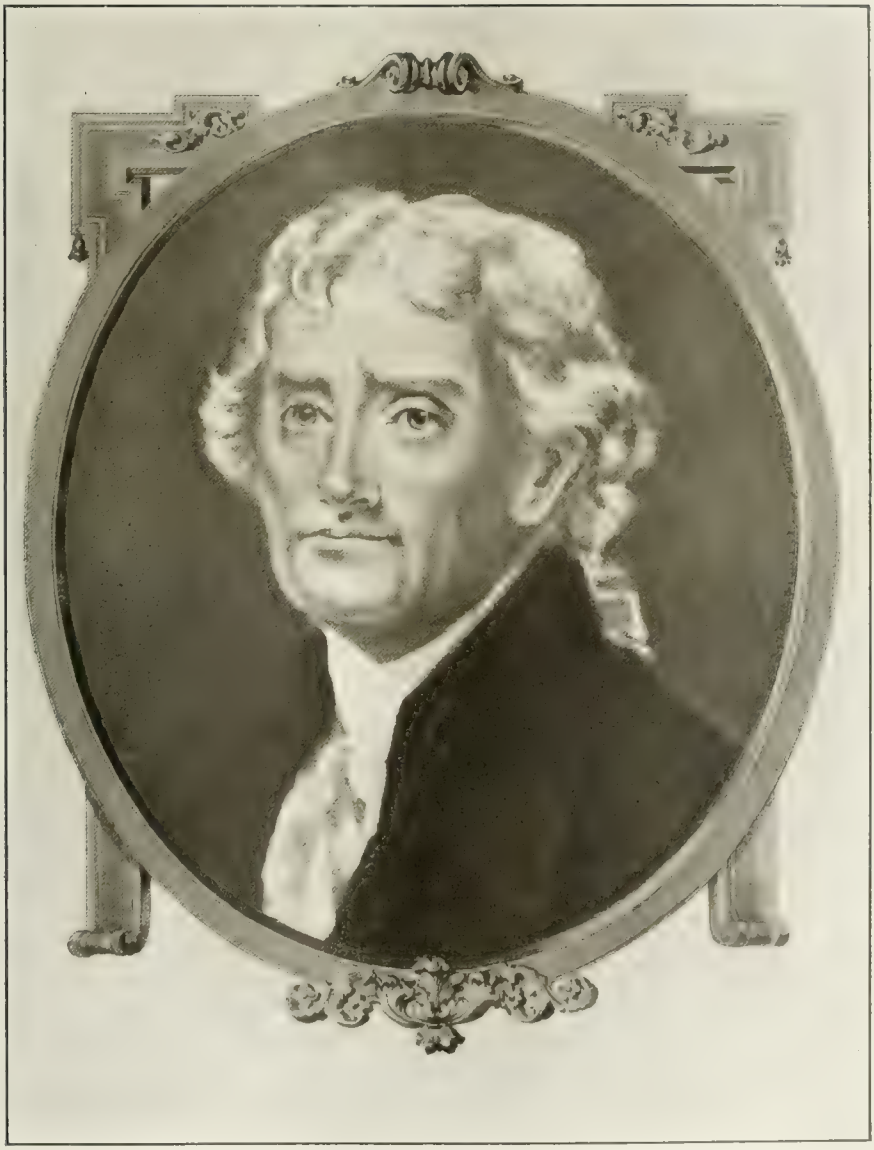
Jeannette, jĕn-nĕt', Pa., borough in Westmoreland County; on the Pennsylvania railroad; about 22 miles southeast of Pittsburg. The natural gas which supplies the borough has contributed somewhat to its development. It is situated in a fertile agricultural region, which is also a coal mining section. The government is vested in a burgess, who holds office three years, and a council. Pop. (1890) 3,296; (1900) 5,865.

Jeannette Expedition, an enterprise, projected 1879 by James Gordon Bennett of the New York *Herald*, who sent out an Arctic expedition from San Francisco in the steamer Jeannette, under command of Lieut. De Long, U. S. N. The Jeannette was early caught in the icepack, drifted for nearly two years, and never escaped from its grip. After the wreck of the Jeannette the crew embarked in two cutters and a whaleboat. Lieut. Danenhower and a portion of the Jeannette's crew reached New York in May 1882. The bodies of De Long and his men were finally discovered in the snow, with evidences that all had perished from cold and hunger. See POLAR RESEARCH.

Jebb, SIR **Richard Claverhouse,** English Greek scholar: b. Dundee, Scotland, 27 Aug. 1841; d. 9 Dec. 1905. He was educated at the Charterhouse, London, and Cambridge University, and in 1869 became public orator there. In 1875 he was called to fill the Greek chair in Glasgow University, which he resigned in 1889, on being appointed Greek professor at Cambridge. He several times visited the United States, and in 1874 married the widow of a general in the United States army. He was lecturer at Johns Hopkins University, Baltimore, in 1892. His best known works are: 'The Attic Orators' (1876); 'Modern Greece' (1880); a 'Life of Richard Bentley' (1882); 'Homer: an Introduction to the Iliad and Odyssey' (1886); 'Lectures on Greek Poetry' (1893); 'Humanism in Education' (1899); and an addition of Sophocles, with notes and translation. After 1891 he represented Cambridge University in Parliament. He was knighted in 1900.

Jefferson, jĕf'ĕr-sŏn, **Charles Edward,** American Congregational clergyman: b. Cambridge, Ohio, 29 Aug. 1860. He was graduated from Ohio Wesleyan University (Delaware, Ohio) in 1882, from the School of Theology of Boston University in 1887, was ordained to the Congregational ministry in 1887, and became pastor of the Broadway Tabernacle, New York. Among his writings are: 'Quiet Talks with Earnest People in My Study'; and 'The Broadway Tabernacle of the Past and Future' (1901).

Jefferson, Joseph, American actor: b. Philadelphia 20 Feb. 1829; d. Palm Beach, Fla., 23 April 1905. He was privately educated and was early upon the stage, among his first public appearances being that as a miniature of T. D. Rice in one of the latter's "Jim Crow" entertainments at Washington, D. C. In 1843 he became a member of a band of strolling players that gave primitive entertainments through Mississippi and Texas, and followed the United States army into Mexico. On his return to the United States he appeared at the Arch Street Theatre, Philadelphia, directed the performances at Peale's museum in that city, became known as an excellent stock actor, and in 1851 played Marroll in 'A New Way to Pay Old Debts' to the Sir Charles Overreach of Junius Brutus Booth. His prominence began with his creation of Asa Trenchard in 'Our American Cousin,' which eliminated from the stage the traditional caricature of Yankee character. He then appeared in the parts he afterwards made famous: Newman Noggs in 'Nicholas Nickleby'; Caleb Plummer in 'The Cricket on the Hearth'; Dr. Pangloss in 'The Heir at Law'; Dr. Ollapod in 'The Poor Gentleman'; Mr. Golightly in 'Lend Me Five Shillings'; Salem Scudder in 'The Octoroon'; Bob Acres in 'The Rivals'; and, above all, Rip Van Winkle in the play of that name. Dissatisfied with his own dramatization of Irving's sketch, in which he had appeared at Washington in 1860, Jefferson had the play re-written by Dion Boucicault, and in Boucicault's version, with slight changes,



afterward acted. The drama ran for 170 nights at the Adelphi, London, in 1865, and in the United States was so successful that for years Jefferson appeared there in nothing else. Jefferson's Rip established itself as one of the classic creations of the stage, and outside of Shakespeare probably no character ever attained so wide and permanent a recognition among the American public. In the later years of his life he played but a few weeks annually in a repertoire of favorite parts. He also made a considerable reputation as an artist by his impressionist landscapes in oils. His acting method was distinguished by ease, verisimilitude, and perfection of finish. In the plays used by him he, for artistic purposes, introduced several admirable changes and additions. He published an interesting Autobiography' (1890); and a 'Reply to Ignatius Donnelly on the Shakespeare-Bacon Argument.' Consult the 'Autobiography,' and Carroll, 'Twelve Americans' (1883).

Jefferson, Thomas, American statesman, third President of the United States: b. Shadwell, Albemarle County, Va., 13 April 1743; d. Monticello, Albemarle County, Va., 4 July 1826; student at William and Mary College, Williamsburg, Va., 1760–2; student of law 1762–7; member of House of Burgesses 1769–74; member of Virginia Conventions 1774 and 1775; of the Continental Congress 1775–6; of Virginia Legislature 1776–9; governor of Virginia 1779–81; member of Congress 1783–4; minister to France 1784–9; secretary of state 1790–3; Vice President 1797–1801; President 1801–9; in retirement at Monticello 1809–26.

Early Life.— Thomas Jefferson was the son of Peter Jefferson, a planter of Albemarle County, Va. His mother was Jane Randolph, daughter of Isham Randolph, who was a descendant of William Randolph of Turkey Island, the progenitor of that family so well known in Virginia history. Jefferson's birthplace was Shadwell, about four miles from the city of Charlottesville. At this homestead he resided until it was destroyed by fire in 1770; thereupon Jefferson selected a low mountain about two miles from Charlottesville, where he built that now famous mansion, "Monticello." Albemarle County, Va., has the proud distinction of being the section in which Jefferson was born, reared, lived, died and lies buried. Jefferson's early education, as was usually the case with Virginia planters, was entrusted first to a private tutor, from whom he learned Latin, Greek, French, and mathematics. At 14 his father died, and after two years in a school conducted by the Rev. James Maury, he entered in 1760 William and Mary College, at that time the best institution of learning in America. The student Jefferson is described as tall and raw-boned, with reddish hair and grayish hazel eyes. He was not then regarded as handsome, though in after years he was considered as probably the most attractive in appearance of the great Virginia statesmen. As a youth he was noted for his intelligence, and while at college, he was in constant association with such men of culture as George Wythe (q.v.), the eminent lawyer; Professor William Small, the profound scholar, and Governor Francis Fauquier (q.v.), the gay and accomplished gentleman. With these gentlemen, many years his senior, he was accustomed to discuss the deepest questions of philosophy and government. In Williamsburg, Jefferson was one of the leaders in all social functions, and always attended the balls given in the Apollo Room of the Raleigh Tavern. Probably his first year at college was spent among too many festivities, but during his second year he is said to have been a most diligent student, often devoting 15 hours a day to his books. After two years of college work, he commenced the study of law under George Wythe, but did not apply for admission to practice before the general court of Virginia till 1767. Jefferson was now 24 years of age; he had a large farm of 1,900 acres (soon increased to 5,000 acres) to which he gave his personal supervision. Though he devoted much time to this farm, he succeeded so well as a lawyer that his profession soon paid him $3,000 annually.

A Revolutionist.— In 1769 he was returned by Albemarle County a member of the House of Burgesses, an honor which his father had had before him. This was Jefferson's beginning as a statesman. He had stood in 1765 in the hallway of the House of Burgesses when Patrick Henry (q.v.) offered his famous Resolutions against the Stamp Act, and from Patrick Henry he imbibed the spirit of revolution. Just as soon as he became a member of the Burgesses, he joined the party of resistance to England. He was by nature a bold and fearless thinker, and when a mere boy he had had engraved on a seal as his motto, "Resistance to tyrants is obedience to God," a principle to which he held throughout his long and eventful life. Jefferson was present when the House of Burgesses passed the resolutions of 1769. He was one of those who signed the agreement not to import goods from England. He was also a member of the House of Burgesses when, in 1773, it established a Committee of Correspondence between Virginia and the other colonies. Some think that the resolutions for such a committee were drawn by Jefferson, though they were offered in the house by his kinsman, Dabney Carr (q.v.). Of this committee Jefferson was a member. He served again in the House of Burgesses in 1774, and was one of those who voted for the resolution appointing a day of fasting and prayer because of the oppressive measures which England had passed against the city of Boston. When the governor dissolved the assembly, Jefferson met with those discontented members who called for a general congress of the colonies and asked the freeholders of Virginia for a convention to consider the state of the colony. To this convention Jefferson was returned by the people of Albemarle. The convention of 1774 was the first extra-legal assembly to meet in Virginia. Jefferson was unable to be present, having been taken ill on his way to Williamsburg. However, his influence was felt through a document called "The Summary View of the Rights of British America," which was intended to be a series of instructions to the Virginia delegates to the First Continental Congress. The instrument marked him as a revolutionist, and as an advocate of independence from England, for in it he distinctly claimed that the colonies had a right to govern themselves without interference from the English Parliament. His views were too radical for the Virginia convention to give them its official stamp.

Jefferson was also elected a member of the

THOMAS JEFFERSON,
Third President of the United States.

convention of 1775, which met at St. John's Church, Richmond, and when Patrick Henry by his eloquence carried the colony into open rebellion against the mother country, Jefferson was appointed a member of the committee to devise a plan for organizing the militia of the colony. Shortly after this he became a member of the Second Continental Congress. When he entered that body, he was 32 years of age, being one of the youngest three members. Here he was placed on such important committees as those which drafted a paper to explain the rebellious attitude of Massachusetts at Lexington and Concord, and to reply to Lord North's "Conciliatory Policy." On each committee he showed such a strong republican tendency that his suggestions were not accepted. The members of the Continental Congress of 1775 were not far-sighted enough to see that independence was the only course. Finally, in the spring of 1776, there came to the Virginia members of Congress instructions from the Virginia convention of 1776 that the united colonies should be declared free and independent States; and accordingly Richard Henry Lee, called the American Cicero, moved that a Declaration of Independence should be adopted. In accordance with the motion, a committee was appointed and the members were elected by ballot. Jefferson's facility for writing was so well known to the Congress that he received the highest number of votes and was named as chairman of the committee over such men as John Adams, Benjamin Franklin, Roger Sherman and Robert R. Livingston. To him as chairman fell the task of drafting that immortal document which stands in the history of the world as the most revolutionary political paper ever written. On 4 July 1776, the instrument, practically as offered by Jefferson, was unanimously adopted and to it were placed the signatures of all the members of Congress then present, except one. The principles set forth in that document mean a government by and for the people, and show that Jefferson was far ahead of his day; for it is only at the dawn of the 20th century that we are beginning to comprehend the great and universal truths that Jefferson made known to the world. (See DECLARATION OF INDEPENDENCE.) Jefferson retired from Congress in 1776, and, on returning to his native State, entered the Virginia legislature with the hope of revising and modifying her laws so that they might accord with republican government. For three years he served in the House of Delegates. During this time he succeeded in breaking down the laws of primogeniture and entail, in practically disestablishing the English Church, and in passing one of the best laws that the world has ever seen for public education providing an ideal system from the primary school to the university. Through his influence the legislature appointed a committee to revise thoroughly the laws of Virginia. The committee was composed of Edmund Pendleton, George Wythe and Jefferson. After two years, the revision, chiefly done by Jefferson, was submitted to the General Assembly, but it was not adopted *in toto*. Finally, however, in 1785, while Jefferson was in France, his faithful friend and political follower, James Madison, secured the passage of nearly all of Jefferson's work. It was at this time that the legislature approved the famous Statute for Religious Freedom, by which the complete separation of Church and State was accomplished, except the taking away of the *glebe* lands, a thing which was done in 1802. Jefferson wished even more radical changes in Virginia, such as the equalizing of representation on population instead of having two representatives from each county. He also desired that the suffrage should not be restricted to land owners, but that it should be extended to all men who might be subject to military duty. He likewise advocated more local self-government in the counties and towns of the State. He even went so far as to advocate the emancipation and the deportation of the slaves from Virginia. These measures were too radical for the Virginia Assembly, and were rejected. It is interesting to note, however, that all of them have since been accomplished save the deportation of the negroes.

Governor of Virginia.— Jefferson was governor of Virginia from June 1779 to June 1781. These were trying times; Virginia was invaded by British troops under Cornwallis, and Jefferson lacked money and resources with which to defend properly the State. His administration has often been criticised, some claiming that he was a mere doctrinaire and not a practical man; but close scrutiny shows that he did all that then lay in his power.

In Congress and at the French Court.— In 1783 Jefferson entered the Congress of the United States. To this body he proposed in 1784 a plan for the government of the Northwest Territory which Virginia so generously gave to the Union. One clause of this plan provided for the prohibition of slavery in that territory after 1800, and for this reason the plan was not adopted. In 1787, however, Congress enacted a bill for the government of the Northwest much like the original draft of Jefferson. From him Congress had the plan of our present decimal monetary system. In 1784 Jefferson was sent to France to join Benjamin Franklin and John Adams in negotiating commercial matters with foreign countries, and in 1785 he succeeded Franklin as our minister plenipotentiary to the French court. Through his efforts many unjust impositions on American commerce were removed by the French government.

Secretary of State.— In October 1789 he returned to America, and the following year became secretary of state in Washington's cabinet, in which position he opposed Hamilton (q.v.), who favored the exercise of extensive powers by Congress. Jefferson believed in a real federal relation between the States, and in a restricting of the congressional powers to purely constitutional authorizations. The final line of cleavage came when Congress passed a bill to establish a national bank. Hamilton submitted to Washington a paper asserting that such a step was legal, while Jefferson made a vigorous written protest showing that the bill was unconstitutional. Washington approved the measure, thus accepting Hamilton's views as correct. The Bank Bill, along with similar congressional acts, caused the establishment of two distinct parties — the Federalist or Loose Construction Party, headed by Hamilton, and the Anti-Federalist or Strict Construction Party, with Jefferson as its leader. Jefferson's followers were usually called the Democratic-

Republicans. (See BANKS AND BANKING, AMERICAN.)

In December 1793 Jefferson resigned from the cabinet and returned to Monticello, where he remained for four years, studying farming. His estate at this time contained 10,647 acres of land, worked by 154 slaves, and stocked with 34 horses, 5 mules, and 249 cattle. Among the negroes he had a sort of industrial (manual-training) school, and taught them to be cabinet-makers, bricklayers, masons and smiths.

Vice President.— From his retirement at Monticello, Jefferson was called to become Vice President in 1797, a position which he held till 1801. During these four years, he bitterly opposed the so-called monarchical tendencies of the Federal party as seen in the Alien and Sedition Acts (q.v.), and he boldly asserted the compact theory of State sovereignty in the Kentucky Resolutions of 1799. The Kentucky Resolutions and Virginia Resolutions of 1798–9 (the latter framed by Madison after a copy of the Kentucky Resolutions sent him by Jefferson), made the platform, so to speak, of the Democratic-Republican party which elected Jefferson as President in 1801.

President.— From 4 March 1801 to 4 March 1809 Jefferson was President. He was the first President to be inaugurated in Washington City. He believed in rotation in office, and in pursuance of this idea, removed a number of Federalists from their positions. His great act, however, was the purchase of the Louisiana Territory from France for the sum of $15,000,000. This vast territory was acquired for two reasons: (1) In order that the United States might have control of the Mississippi River, and the port of New Orleans; and (2) that the United States might not be hampered by European countries in the development of a republican form of government. As secretary of state in Washington's cabinet, Jefferson had practically asserted what was afterward known as the Monroe Doctrine, when he claimed that the United States should see that no European countries, other than those already holding possessions, secure a foothold in America. In 1801 Jefferson viewed with alarm the transfer of the Louisiana Territory from Spain to France, for he feared that, with France added to Spain, England and Russia, in control of colonies in America, republican government would have a hard struggle. Jefferson was accused of inconsistency for having sanctioned the Louisiana Purchase (q.v.), for if he had applied the strict construction principle of the Constitution here as in such acts of Congress as the establishment of the national bank, this Territory could not have been purchased, there being no provision in the Constitution allowing territorial expansion. But Jefferson's political sagacity kept him from refusing this great opportunity, and his wish of expansion caused him to advocate earnestly the purchase of Florida from Spain. It was 13 years later before his desire was accomplished. The second administration of Jefferson was not so successful as the first. It opened with a war against the Tripolitan pirates who were plundering American commerce. The outcome of this war was to increase our influence among the nations of the world. The last years of the second term were marked with difficult complications arising out of the Napoleonic wars. Napoleon tried to prevent the United States from trading with England, and England retaliated by attempting to cut off all commercial relations between the United States and France. Many American vessels were seized by both England and France. Adding to this indignity, England claimed the right to search American vessels for English seamen, and an English war vessel actually fired on an American man-of-war, killing three of the crew and wounding 18. Jefferson tried to meet the restrictions on American commerce by the Non-Importation Bill and the Embargo Act. To enforce the measures all of the New England ships would have been shut up in American harbors. The New England merchants preferred to run the risk of losing their ships to keeping them without traffic; therefore they began to abuse the President and his policy. The result was that Congress felt forced to repeal the Embargo Act. Jefferson always claimed that had the embargo been enforced the United States would have gained its rights without the second war with England in 1812. (See EMBARGO IN THE UNITED STATES.)

Private Citizen.— On 4 March 1809, Jefferson retired from the White House, and spent the remaining 17 years of his life at Monticello. In these latter days he was known as the "Sage of Monticello," and to his home came people of prominence from all parts of the world to consult with him on great questions of politics and economics. Often his housekeeper had to provide beds for 50 guests. The demands which were made on his hospitality were so great that he died a bankrupt. During this period of his life he did all that he could to encourage better methods in agriculture, to reform the government of Virginia, and to develop in it a better system of education. The crowning event of his life was the establishment of the University of Virginia (q.v.) in 1819. He died on 4 July 1826, just 50 years from the day that has made him famous in all history, and by a singular coincidence his old rival and political antagonist, John Adams, passed away on the same day. Jefferson asked that three things be inscribed on his tomb: "Author of the Declaration of Independence; of the Statute for Religious Liberty in Virginia, and Founder of the University of Virginia,"— three acts which have made him famous.

Jefferson's Principles.— Jefferson stands in history for: (1) Republican government and the sovereignty of the people; (2) Opposition to privileged orders of nobility and the entail system; (3) Universal education and local circulating libraries; (4) Separation of Church and State; (5) Freedom of thought and speech; (6) Local self-government; (7) Economy in government and small public debt; (8) A policy of peace; (9) Political equality and universal suffrage; (10) Strict construction of the Constitution and the sovereignty of the States; (11) Well-trained militia and small standing army; (12) Metallic money, either gold or silver, as a standard, and no paper legal tender; (13) Opposition to bounties and monopolies; (14) Emancipation and deportation of slaves; (15) Expansion of the United States to include Louisiana, Florida, Cuba, and Canada; (16) Maintenance of Indian reservations; (17) Judiciary beyond the control of the legislative or executive branches of government; (18) Small navy; (19) Opposition to nepotism; (20) Rotation in

office; (21) Opposition to all secession movements, North or South. This review will show that Jefferson probably gave to the world more broad principles of government than any other man. Wherever republican forms of government exist there the name of Jefferson will always be uttered with reverence and respect.

J. A. C. CHANDLER,
Of Richmond College, Richmond.

Jefferson-Burr Imbroglio, ĭm-brō'lyō, a disputed Presidential election which resulted from a defective clause in the Constitution and caused its amendment in 1800. By its original provisions, the person who received the highest number of electoral votes should be President, the next highest Vice-President. Each set of electors had informally agreed that to save the pride of the leading candidates (Jefferson and Burr, Adams and Pinckney) each pair should have equal votes, and with one exception never reflected that this meant a tie; one Rhode Island Federalist elector cast his second vote for John Jay instead of Pinckney, and there is an unproven charge that Burr intrigued for an extra vote over Jefferson. They, however, received 73 each, and the Federalist House had to choose between the two Democratic candidates. Rules were adopted for the balloting, among the chief being that the Senate should be admitted, that the balloting should be in secret session, and that the House should not adjourn till a choice was made. The Federalists in caucus decided to vote for Burr; perhaps partly to spite the Democrats — Jefferson being their great national leader and the great Federalist terror, and the man the Democrats had intended to vote for as President — and partly because Burr as a New York man would consult Northern commercial interests, which the Virginian Jefferson might antagonize. They were right in this; Burr would not have laid the Embargo. Their solid vote would have elected Burr by one (nine out of 16 States); but they could not hold their members, three of whom bolted and voted for Jefferson to satisfy public feeling in their districts. Thus Jefferson had eight States, Burr six, and Vermont and Maryland were divided. But the Burr electors in the last two secretly agreed with Bayard of Delaware, who had also voted for Burr, that if there were likely to be bad blood and danger from prolonged balloting, they would stop it by voting for Jefferson. The casting vote thus lay with Bayard, who justly commanded confidence; but as the agreement was not known, the situation seemed much more perilous than it was. The balloting lasted a week without change. Some of the Federalists plotted to have it last till John Adams' term expired, and then let the others fight it out, or leave it by special act to Chief Justice John Marshall (Federalist), as a sort of regent trustee. The Democrats countered by resolving either to have Jefferson and Burr jointly (one of them certainly being President) call a special session, or to seize the capital by a militia force, call a convention, and revise the Constitution. Finally, after 34 ballots, the confederate electors decided that if Jefferson would give a guarantee for the civil service, he should have the election after one more ballot; he gave the guarantee, and was elected on the 36th ballot by 10 to 6 (States). Burr became Vice-President; that the attempt to put him at the head was mainly due to real fear for commerce is made probable by the fact that every New England State except the one (Vermont) which had no commerce, voted for him to the last. This affair resulted in the passage of the Twelfth Amendment (see CONSTITUTION OF THE UNITED STATES), which obliged the electors to specify their choice for the offices on distinct ballots, and enlarged the range of choice to three candidates in case of tie.

Jefferson, Texas, city, county-seat of Marion County; on the Cypress Bayou, and on the Missouri, K. & T. and the Texas & P. R.R.'s; about 20 miles from the eastern boundary of the State and 142 miles east of Dallas. It was settled in 1850 and incorporated in 1866. It is situated in an agricultural and stock-raising region with rich iron ore deposits in the vicinity. Some of the principal industrial establishments are furnaces, machine-shops, foundries, sawmills, cottonseed-oil mills, and large storage houses. The shipments are chiefly articles manufactured in the city, vegetables, grain, cotton, live stock, and fruit. The principal buildings are a government building, the city and county buildings. An iron bridge across the Bayou and good roads assist in making Jefferson the trade centre for a large part of Marion and Cass counties. Pop. (1900) 2,850.

Jefferson, Wis., city and county-seat of Jefferson County, at the junction of the Rock and Crawfish rivers, 50 miles west of Milwaukee; and on the Chicago & Northwestern railroad. It was settled in 1837 and is governed by a mayor and a council elected every two years under a charter of 1893. It has pork-packing plants, flour-mills, tanneries, brick and tile works, carriage and wagon factories and other industries. The city owns and operates the waterworks and the electric-lighting plant. Pop. (1900) 2,584.

Jefferson City, Mo., city, capital of the State, and county-seat of Cole County; on the Missouri River, and the Chicago & A., and the Missouri P. R.R.'s; 125 miles west of Saint Louis. It is the farming and manufacturing trade centre for Cole and adjacent counties; has manufactories of flour, shoes, clothing, beer, brooms, bricks, farming implements, carriages and wagons, and iron foundries. It is the seat of Jefferson City College, the general western offices of the Standard Life Insurance Company, Lincoln Institute, State Capitol building, State penitentiary, State armory, governor's mansion, Supreme Court building, United States courthouse, and the Carnegie Public Library. It has gas and electric light plants, 2 national banks, daily, weekly, and monthly periodicals, and an assessed property valuation exceeding $800,000. Jefferson City was settled in 1826 and was first incorporated in 1839. A mayor and council elected every two years administer the affairs of the city. Pop. (1890) 6,742; (1900) 9,664.

Jefferson River, Montana, a stream about 200 miles long, formed by the union of the Beaver Head and Wisdom (or Big Hole) rivers in Madison County. It unites with the Madison and Gallatin to form the Missouri.

Jeffersonton, Engagement at. Early in October 1863 the Army of the Potomac, under command of Gen. Meade, lay around Culpeper Court House, with the advance of two corps on the Rapidan. Gen. Lee, who was south of the Rapidan, determined to flank Meade's position, seize the Orange and Alexandria Railroad north of the Rappahannock, and intercept his retreat upon Washington. Informed of the movement, Meade withdrew his army to the north side of the Rappahannock, 11 October, his rear-guard of cavalry having a sharp engagement with the Confederate cavalry at Brandy Station. Believing that the Confederate army was moving upon Culpeper, Meade turned about and on the 12th, threw three infantry corps and a cavalry division south of the Rappahannock, with instructions to push forward and find and strike Lee, if at Culpeper. When they reached Brandy Station the Confederate army was nowhere in that neighborhood. At this time Gen. Gregg's division of Union cavalry was guarding the upper fords of the Rappahannock and Hazel rivers; on the morning of the 12th Col. Gregg's brigade crossed the Rappahannock near Sulphur Springs; his pickets at Jeffersonton being driven in, he marched for that place, found it in possession of the enemy, drove them from the town, and occupied it. That morning Fitzhugh Lee's cavalry division, leading the Confederate advance from near Madison Court House, crossed Hazel River at Starks' Ford and pressed on toward the Rappahannock. The 11th Virginia cavalry drove Gregg's skirmishers into Jeffersonton and attacked the two regiments in the town, but was driven out after losing several men. The 7th and 12th Virginia were now sent to the left and right, encircling the town, a combined attack was made, and Gregg was utterly routed and driven across the Rappahannock, with a loss of about 400 men, most of them captured. The Confederate loss was about 40 killed and wounded. When Meade heard of the engagement, and that Lee was crossing the Rappahannock at Warrenton Springs, he hastily recrossed the river, withdrew to Auburn and Catlett's Station and, on the 14th, to Centreville, Lee following closely and attacking his rear at Auburn and Bristoe Station during the day. Consult: 'Official Records,' Vol. XXIX.; Walker, 'History of the Second Army Corps.'

E. A. CARMAN.

Jef'fersonville, Ind., city and county-seat of Clark County; on the Ohio River, and the Baltimore & O. S. W., the Pittsburg, C. C. & St. L. and several other railroads; 50 miles southwest of Evansville. It is opposite Louisville, Ky., with which it is connected by railroad bridges. It contains the Southern State penitentiary, high school, public library, prison library, United States quartermaster's supply depot, and has waterworks, gas and electric lights, street railways, large car works, 2 national banks, daily, weekly, and monthly periodicals, and an assessed property valuation of about $1,700,000. Being at the head of the Ohio falls excellent water power is obtained here and the city has numerous industries, among them extensive works for freight and passenger cars and for building river steamboats. The mayor and council are elected biennially; the police commissioners are appointed by the governor of the State. Pop. (1890) 10,666; (1900) 10,774.

Jeffrey, jĕf'rĭ, **Francis,** LORD, Scottish judge and critic: b. Edinburgh 23 Oct. 1773; d. Craigbrook Castle, near Edinburgh, 26 Jan. 1850. He was educated at the University of Glasgow, and Queen's College, Oxford, and was admitted to the Scottish bar in 1794. He assisted in establishing the 'Edinburgh Review' in 1802 with Sydney Smith, Lord Brougham, and others, and after two numbers had been issued became its editor, a position which he held till June 1829. In 1831 he was made lord-advocate, and sat for several years as member of Parliament for Edinburgh. He was made a lord of session in 1834, and continued during a period of 16 years to be one of the ablest and most popular judges of the supreme court in Scotland. Consult: Cockburn, 'The Life of Lord Jeffrey' (1852); Gates, 'Three Studies in Literature' (1899).

Jeffreys, jĕf'rĭz, **George,** LORD, English judge: b. Acton, near Wrexham, Wales, 1648; d. London 19 April 1689. He was called to the bar in 1668, and soon after was chosen recorder of London. He was appointed, successively, a Welsh judge and chief justice of Chester, created a baronet in 1680, and became chief justice of King's Bench in 1683. He was one of the advisers and promoters of the arbitrary measures of James II.; and for his sanguinary and inhuman proceedings against the adherents of Monmouth on the famous 'Bloody Assize,' was rewarded with the post of lord high chancellor (1685). After the abdication of King James the chancellor, who had disguised himself as a seaman, was detected by a mob and carried before the lord mayor, who sent him to the lords in council, by whom he was committed to the Tower, where he died. Consult: Woolrych, 'Memoirs of the Life of Judge Jeffreys' (1827); Campbell, 'Lives of the Lord Chancellors,' Vol. IV. (1849–57); Macaulay, 'History of England,' Vols. I. and II. (1856); Irving, 'Life of Judge Jeffreys' (1898).

Jeffries, jĕf'rĭz, **John,** American physician: b. Boston, Mass., 5 Feb. 1744; d. there 16 Sept. 1819. He was graduated at Harvard in 1763, studied medicine at London and Aberdeen, and returning to Boston in 1769 he entered upon a lucrative practice, which continued until the evacuation of the town by the British troops, whom he accompanied to Halifax. After serving as surgeon-general of the troops in Halifax, he was appointed in 1779 surgeon-major of the forces in America. In the succeeding year he established himself in London in the practice of his profession, but also occupied himself much with scientific studies, and in the prosecution of his experiments in atmospheric temperature undertook 7 Jan. 1785, a remarkable voyage in a balloon from Dover cliffs across the British channel, landing in the forest of Guiennes in France. This was the first successful attempt at aërostation on an extended scale, and Jeffries in consequence received many attentions from the learned societies of Paris. In 1789 he returned

to Boston, where he practised his profession until the close of his life. He announced a course of lectures on anatomy in Boston in 1789, but so great was the prejudice against the practice of dissecting, that on the evening of the second lecture a mob broke into his anatomical room. The course thus interrupted was never resumed, and the single lecture delivered by Jeffries is said to have been the first public one on anatomy given in New England.

Jehovah, jẹ-hō'vạ, the most sacred name applied to God among the Jews, though the Hebrew word in the English Bible is generally translated by LORD (in small capitals). The case is similar with the Greek version (the Septuagint), which renders this word by *Kyrios,* and with the Latin Vulgate, which translates it by *Dominus,* both these words signifying Lord. The proper form of the name is now generally believed to be *Yahveh* or *Yahweh.* Why there should be any doubt about the matter is explained by the fact that in Hebrew only the consonants were written, giving the form *Yhvh,* and the name itself was never uttered, the Jews in reading substituting another divine name, usually *Adonai.* The exact meaning of the word is doubtful, but as a form of the Hebrew verb "to be" some explain it as, He who is, was, and will be, or the Eternal and Unchangeable, and it seems certainly to imply existence. The awe which the Hebrews cherished for this name led them to avoid pronouncing it, as they still do. The monotheistic conception of the Jehovah of the Israelites differs from all other theological conceptions of that age. No image of him was allowed. He was the invisible protector and king of Israel, worshipped by obedience to his commandments, and an observance of the ceremonies established by the law. As is well known, in some parts of the Pentateuch *Elohim* is used almost exclusively, in others *Jehovah,* and this has led many to imply a corresponding difference of authorship. Others deny that this is at all a necessary deduction, maintaining that either name might be used by the same writer according to the conception of the Most High that was in his mind at the moment, Elohim being the abstract expression for absolute Deity, apart from the special notions of eternity, unity, holiness, etc.

Jehovist, jẹ-hō'vĭst, sometimes called JAHWIST, a hypothetic author of the Pentateuch, who used the word Jehovah, or Jahweh, as the name of God instead of Elohim, which term denotes the Supreme Being in other passages of the sacred canon. To the writer who employs the latter designation is applied the term Elohist. According to the theories of many modern Biblical critics the present Pentateuch is a compilation from two original records, one made by an Elohist, the other by a Jehovist. The Jehovist history is supposed to be the older of the two (by some critics it is dated 950 B.C.), and to have consisted of an account of Jehovists dealings with the chosen people up to the conquest of Palestine west of the Jordan. It is a religious history of the attainment of the Promised Land. In this history was emphasized the supremacy of Jehovah as the one God, creator of the world, and the national God and Father of the chosen people, in whose affairs He interposes as He appeared to their early forefathers in the shape of a man or an angel. In the Elohist record, which is supposed to cover the same period and to have been written 700 B.C., there is a more modern interpretation of history attempted. The anthropomorphic suggestions of deity are softened, Elohim interposes merely by a voice, speaking to his people in words of encouragement or rebuke. Through the narrative of the hypothetical Elohist there runs also a tone of sadness, there are anticipations of coming disaster and disappointment.

The Jehovistic or Jahwistic editor who combined these two histories is supposed to have lived in the 7th century B.C., while in the 4th century B.C. a third post-exilic writer added to these combined elements the legal codes which swelled the Pentateuch into the Hexateuch.

Jehu, jē'hū, general of the army of Joram, king of Israel. The prophet Elisha sent one of the school of the prophets to annoint him king over Israel, and in a sudden revolution Joram was slain and Jehu reigned in his stead. He was the first of a new, the fifth, dynasty, and reigned 843–815 B.C. On his accession he massacred all the family of Ahab, including his wretched wife Jezebel, and put the priests of Baal to the sword. In order to obtain possession of the kingdom of Judah he slew Ahaziah the king, and 42 of his family. But his reign was not a prosperous or successful one, and by an invasion of the Assyrians he lost all the territory east of the Jordan. His name has been found on the black obelisk discovered by Layard at Nineveh, and now in the British Museum. This obelisk was set up by Shalmaneser II., and the inscription refers to the tribute paid by Jehu to the Assyrian monarch.

Jejeeb'hoy, SIR **Jamsetjee,** Parsee merchant and philanthropist: b. Bombay 15 July 1783; d. there 15 April 1859. By his energy and business talents he succeeded in achieving for himself the position of the first native merchant in India, and realizing a fortune of nearly a million sterling. The munificence displayed by him toward all benevolent and public objects, without regard to class or creed, was of the most princely kind, his donations from first to last being estimated at about $1,500,000. Among benevolent institutions founded by him are the great hospital at Bombay which bears his name, the establishment in the same city for the education of poor Parsee children, and the *dhurumsallas,* or places of refuge for travelers in various parts of the country. He also constructed the causeway uniting the islands of Bombay and Salsette, the waterworks at Poonah, the bridges at Earla, Parta, and Bartha, and other public works. He was knighted in 1842, and in 1857 made a baronet. A statue was subsequently erected in honor of him in the town-hall of Bombay.

Jejunum, jẹ-joo'nŭm (Latin, *jejunus,* empty), the second portion of the small intestine, succeeding the duodenum, and so named from its generally being found empty after death. The duodenum extends to about 12 inches in length, and the jejunum forms two fifths of the remaining portion of the small intestine. See INTESTINE.

Jekyll, jē'kĭl, **Gertrude,** English horticulturist: b. London 29 Nov. 1843. She holds the

gold medal of the Royal Horticultural Society and has published: 'Wood and Garden' (1899); 'Home and Garden' (1900); 'Wall and Water Gardens' (1901); 'Lilies for English Gardens' (1901); 'Roses for English Gardens' (1902).

Jelliffe, Smith Ely, American physician: b. Brooklyn, N. Y., 27 Oct. 1866. He was graduated from the Brooklyn Polytechnic Institute in 1886, and in 1889 the degree of M.D. was conferred upon him at Columbia University. He is instructor in Materia Medica in Columbia University and has done much original work in botany, pharmacognosy, therapeutics, and nervous and mental diseases. He has published numerous writings on those subjects. Some of his more important works being 'The Flora of Long Island'; a text-book of botany; a text-book of pharmacognosy; and a text-book of nervous and mental diseases; as well as translations from French and German writers on nervous and mental diseases. He is editor of the 'Medical News,' and managing editor of the 'Journal of Nervous and Mental Diseases,' and is also medical editor of the 'Encyclopedia Americana.'

Jelly includes every translucent juice so far thickened as to coagulate when cold into a trembling mass; as the juices of acid or mucilaginous fruit, currants, etc., which, by the addition of one part of sugar to two parts of juice, and, by boiling, have obtained a proper consistence.

1. *Animal Jelly.*— The soft parts, such as the muscles, skin, cartilage or integuments of animals, when boiled in water, yield a solution which on cooling solidifies to a tremulous jelly. Seventy pounds of bones, when treated with 1 pound of water in the form of steam, at a pressure of 4 pounds to the square inch, and simultaneously digested in 5 gallons of water, will yield about 20 gallons of a strong jelly.

Animal jelly seems to be nearly identical in composition with the tissues which yield it, so that we are unable to trace any chemical change, except, perhaps, the assimilation of water during the process of its manufacture. The following analysis shows the average percentage of carbon, hydrogen, and nitrogen in animal jelly:

	Carbon	Hydrogen	Nitrogen
(1)	49.0	7.0	19.4
(2)	50.0	6.5	17.5

2. *Vegetable Jelly.*— When the juice of fruits is heated with sugar, the liquid forms a stiff jelly on cooling. It appears from the researches of Frémy and others that unripe fruits contain a compound of carbon, hydrogen, and oxygen, called *pectose;* as the fruit ripens, this substance is transformed into *pectin,* the change being brought about chiefly by the influence of a peculiar ferment called *pectase,* which is contained in the fruits. As pectin is soluble in water, the expressed juice of ripe fruits contains a large quantity of this substance, which on heating to a temperature of about 105° F. is converted into one or more substances which have not as yet been completely studied, but which have the property of gelatinizing on cooling. The principal of these substances are *pectosic* and *metapectic* acids. This latter acid, when boiled along with another strong acid, whether mineral or organic, is decomposed, one of the products being pectin sugar, a substance which is closely allied to glucose, so that in all probability there is produced in the very process of manufacturing jellies more or less of this sugar, which certainly is not cane-sugar, and which might, therefore, be by some regarded as an adulteration. The processes which, in the living plant, result in the transformation of pectose into pectin may be imitated on a small scale by heating the juice of unripe fruit with the pulp, which contains the ferment pectase, or with a dilute acid which induces the same change as this substance. Alkalies also produce a similar effect. The exact composition of these various pectous substances yet remains a matter of doubt.

Jel'lyfish, the medusa-stage of *Hydrozoa* (q.v.), but more especially the common name of *Scyphozoa* (formerly *Discomedusa*), the second class of the phylum *Cœlenterata* (q.v.). A familiar example is the common large jellyfish of the coast of New England, *Aurelia flavidula.* It sometimes reaches the diameter of 10 inches; its umbrella-shaped body is convex and smooth above, and from the under sides hang down four thick oral lobes which unite to form a square mouth-opening also giving off four tentacles. The margin of the umbrella or disk is fringed and bears eight eyes which are covered by a lobe. Just under the surface are seen the water-vascular canals, branching out from four primary canals radiating from the stomach. When in motion, the disk contracts and expands rhythmically, on the average from 12 to 15 times a minute.

The *Aurelia* spawns late in the summer, the females having yellowish ovaries, while the sperm glands of the males are roseate in hue. The eggs are fertilized in the sea, and the ciliated pear-shaped larva by October sinks to the bottom, attaching itself to rocks or shells, finally assuming a hydra-like shape, with often as many as 24 long slender tentacles. This is the *Scyphistoma* stage in which it remains about 18 months. From this it passes into the *Strobila* stage in which the body divides into a series of cup-shaped disks, each of which is scalloped on the upturned edge. These disks separate one after the other in March, and swim away as miniature jellyfishes called *Ephyræ.* The *Ephyra* is at first about a fifth of an inch in diameter, and becomes a fully formed *Aurelia* in April, reaching maturity in August. Another but less common jellyfish on the coast of New England and in the North Atlantic is the great *Cyanea arctica,* or "blue jelly," which is nearly two feet in diameter, sometimes from three to five, and with very long string-like tentacles, sometimes extending from 20 to 100 feet, which are filled with stinging or lasso-cells (*trichocysts*), so that the animal is poisonous to fishermen and bathers. While these forms undergo a metamorphosis, in fact, an alternation of generation; other kinds, as *Pelagia,* etc., are known to develop directly from the egg, and even the aurelia under exceptional circumstances does not pass through the scyphistoma stage. The jellyfishes are divided into a number of groups. They are most numerous in the tropical seas, comprising forms of great beauty. Consult: Romanes, 'Jellyfish, Starfish and Sea Urchins' (1885); Packard, 'Zoology' (1897); Arnold, 'The Sea Beach at Ebb-tide' (1902).

JELLYFISHES.

FORMS OF DISCOMEDUSÆ.

1. Pilema giltschii (¼ natural size).
2. View of the same from above (the organs seen through the transparent convex disk or "umbrella").
3. View of the same from beneath.
4. Rhopilema frida (½ natural size).
5. Brachiolophus collaris (½ natural size).
6. Cannorrhiza connexa.
7. The same, from beneath (½ natural size).

Jena, yā'nä, Germany, town 12 miles east of Weimar, on the left bank of the Saale. It consists of the town proper and of four suburbs, and is a dull antiquated place. It contains a famous university which was opened in 1558, and attained its highest prosperity toward the end of the 18th century, when it numbered Schiller, Humboldt, Fichte, Schelling, and Griesbach among its teachers, and was attended by above 1,000 students. In 1844 the number had dwindled down to 411; but in 1902 it had about 800. It has 98 professors and instructors, who teach the different branches of law, medicine, philosophy, and theology; and possesses an anatomical theatre, botanical garden, observatory, good physical and chemical cabinets, and a library of 200,000 volumes. Pop. 15,499.

Jenckes, jĕnks, **Joseph,** American inventor: b. Hammersmith, London, England; d. Lynn, Mass., 16 March 1683. About 1645 he came to the Massachusetts Bay colony, and in that year settled at Lynn, where he established the first iron-foundry in the colonies. He was also an inventor, and in 1646 obtained on an improved water-wheel the first recorded patent in America. He secured a patent also for an improved grass-scythe, and originated other improvements and inventions in machinery and tools. In 1654, under contract with the Boston selectmen, he built the first fire-engine in this country. In 1652 at the Lynn iron-works he cut the dies for the Massachusetts coinage, the first executed in America. Among these coins were the so-called "pine-tree" shillings, deriving their name from that emblem on the obverse side.

Jenkin, jĕng'kĭn, **Henrietta Camilla Jackson,** English novelist: b. Jamaica about 1807; d. Edinburgh 8 Feb. 1885. In 1832 she was married to Charles Jenkin, an English naval officer. Her novels were lively studies of character and popular in their day, among the best being: 'Cousin Stella' (1859), a portrayal of West-Indian life and manners; 'Who Breaks, Pays' (1861), in which the flirt is admirably pictured; 'Skirmishing' (1862); 'Two French Marriages,' issued in New York as 'A Psyche of To-day' (1868); 'Within an Ace' (1869).

Jenkins, jĕng'kĭnz, **Charles Jones,** American jurist and statesman: b. Beaufort County, S. C., 6 Jan. 1805; d. Summerville, Ga., 14 June 1883. He was graduated from Union College, Schenectady, N. Y., in 1824, and after the study of law began practice in Augusta, Ga. He was a member of the Georgia legislature in 1830 and after a short service as attorney-general of the State was a member of the legislature 1836–50, and a leader of his party there. He was State senator 1856–60, and was a judge of the Georgia supreme court 1860–5. He became provisional governor of his State in 1865, holding office till 1868, and presided over the Constitutional Convention of 1877. Consult: Jones, 'Life of C. C. Jenkins' (1884).

Jenkins, John Edward, English political and social writer: b. Bangalore, India, 28 July 1838. He was educated at McGill University, Canada, and the University of Pennsylvania, and sat in Parliament for Dundee 1874–80. He became famous by the publication of his 'Ginx's Baby, his Birth and Misfortunes' (1870), a clever satire aimed at the clumsy handling of the problem of English pauperism. Among later works of his which have circulated widely are: 'Lord Bantam' (1871); 'Little Hodge' (1872); 'Jobson's Enemies' (1879–82); 'A Paladin of Finance' (1882).

Jenkins, John Stilwell, American biographer: b. Albany, N. Y., 15 Feb. 1818; d. Weedsport, N. Y., 20 Sept. 1852. He was a lawyer by profession, and at one period edited the Cayuga 'Times.' Among his works are: 'Generals of the Last War with Great Britain' (1841); an abridgment of Hammond's 'Political History of New York' (1846); 'Alice Howard' (1846); 'Life of Silas Wright' (1847); 'History of the Mexican War' (1848); 'Heroines of History' (1853).

Jenkins, Thornton Alexander, American naval commander: b. Orange County, Va., 11 Dec. 1811; d. 9 Aug. 1893. Entering the United States navy as a midshipman in 1828, he served therein during the war with Mexico. Appointed to investigate European lighthouse systems he framed the law passed in 1852 under which the existing lighthouse board is managed. He saw active service during the Civil War and was chief of the bureau of navigation 1865–9. From 1869 to 1871 he was naval secretary of the lighthouse board and commanded the East India squadron 1871–3. In 1870 he was appointed rear admiral and retired from active service in 1873.

Jenkins Ferry, Battle of. During the winter of 1863–4 the Union forces of Generals Steele and Blunt held the line of the Arkansas River, with headquarters at Little Rock; the Confederates, under Gen. Sterling Price, held that of the Washita, with headquarters at Camden, which was strongly fortified. On 23 March 1864 Steele started from Little Rock southward with about 8,000 men to co-operate with Gen. Banks' expedition up Red River, the objective point of both being Shreveport, La. Gen. Thayer, with 5,000 men, left Fort Smith on the 21st to join Steele at Arkadelphia, and Col. Powell Clayton, with a small cavalry force, marched from Pine Bluff in the direction of Camden, which was Steele's first objective. Steele reached Arkadelphia on the 28th, was joined near Elkins' Ferry, on the Little Missouri, by Thayer, and, after several severe skirmishes, in which the Confederates were defeated, flanked Price out of Camden, 15 April, and occupied it. Here he was fully informed that Banks had been defeated on Red River and was retreating, and his own position became very precarious. Gen. E. Kirby Smith, who had been opposing Banks, marched rapidly with three divisions of infantry — 8,000 men and 14 guns — to join Price and crush Steele. Steele was too strongly entrenched at Camden to be attacked, but he was greatly harassed and nearly surrounded by the gathering Confederates, his forage-trains, with their guard, were cut off and captured, and, the loss of a large supply-train at Marks' Mills, 25 April, with nearly an entire brigade and a battery, determined him to fall back to the Arkansas River. He left Camden on the night of the 26th, crossed the Washita, and had hardly begun his movement northward when Smith and Price pressed him vigorously and kept up a running fight, which was particularly sharp on the 29th, when Steele reached Jenkins' Ferry, on the Saline River. The river was swollen,

and Steele had crossed only part of his army when his rear brigade, commanded by Gen. S. A. Rice, was fiercely attacked by Price, and yielded some ground. But the brigade rallied, and, supported by a part of Engelmann's that had not yet crossed the river, engaged in a sanguinary fight lasting the greater part of the day. Three times the Confederates charged and were repulsed, and the Union line advancing, the Confederates fell back and did not renew the fight. Steele now crossed the river without further molestation, and moved leisurely to Little Rock, which was reached 2 May, and Thayer's division was sent back to Fort Smith. Price was so badly defeated that he made no effort to follow Steele north of Saline River. The Union loss at Jenkins Ferry was 63 killed, 413 wounded, and 45 missing. The Confederates report a loss of 86 killed, 356 wounded, and 1 missing. The Union loss during the entire campaign (23 March–2 May) was 102 killed, 601 wounded, and 1,072 missing, a total of 1,775. Consult 'Official Records.' Vol. XXXIV.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. Carman.

Jenks, Edward, English publicist: b. Clapham, Surrey, 20 Feb. 1861. He was educated at Dulwich College and Cambridge University, and was dean of the faculty of law in the University of Melbourne 1889–92, and Queen Victoria professor of law in University College, Liverpool, 1892–6. He is now reader in English law at Oxford, and widely known as a writer on English law, his published works comprising: 'Constitutional Experiments of the Commonwealth' (1891); 'The Doctrine of Consideration in English Law' (1893); 'The Government of Victoria (Australia)' (1893); 'History of the Australasian Colonies' (2d ed. 1896); 'Outlines of English Local Government' (1895); 'Law and Politics in Middle Ages' (1897); 'A Short History of Politics' (2d ed. 1900); 'Edward I.' (1902); 'Parliamentary England 1660–1832' (1903).

Jenks, Jeremiah Whipple, American political economist: b. St. Clair, Mich., 2 Sept. 1856. He was graduated from the University of Michigan in 1878, and subsequently studied in Germany, at the University of Halle. He then studied law and was admitted to the Michigan bar. In 1886 he became professor of Greek, Latin, and German in Mount Morris College, Ill.; in 1886–9 was professor of political science and English literature at Knox College, Galesburg, Ill.; in 1889–91 professor of political economy and social science at Indiana University; and in 1891 became professor of political economy and politics at Cornell University. In 1899–1901 he was expert agent for the United States Industrial Commission on investigation of trusts and industrial combinations, and was also expert for the Department of Labor on the same subject. In 1902 he was commissioner of the United States War Department to the Philippines and other Oriental nations to investigate the condition of labor and other economic subjects. In 1903 he went to Mexico to consult with the minister of finance in regard to a change of the financial system. He has written: 'Henry C. Carey als Nationalökonom' (1885); 'The Trust Problem' (1900); 'Trusts and Industrial Combinations' (1900); a part of the report of the Industrial Commission; and 'Report on Certain Economic Questions in the English and Dutch Colonies in the Orient' (1902); besides many magazine articles. He is recognized as one of the foremost authorities on the trust question, and his writings are marked by scholarly and accurate investigation, combined with unusual simplicity and clearness of statement.

Jenks, Tudor, American editor and author: b. Brooklyn, N. Y., 7 May 1857. He was graduated from Yale in 1878, from the Columbia Law School in 1880, studied art in Paris in 1880–1, practised law in New York in 1881–7, and in 1887 became a member of the staff of the 'St. Nicholas Magazine.' His writings include many magazine contributions in prose and verse, and 'The Century World's Fair Book' (1893); 'Imaginations, or Truthless Tales' (1894); 'The Boys' Book of Explorations' (1900), and 'Galopoff, the Talking Pony' (1901).

Jenner, jĕn'ẽr, **Edward,** English physician, discoverer of vaccination as a preventive of the smallpox: b. Berkeley, Gloucestershire, 17 May 1749; d. there 26 Jan. 1823. Having adopted the medical profession, he visited London to attend the lectures of the celebrated anatomist John Hunter, in whose family he resided for two years. Returning to the country, he settled at Berkeley, to practise the various branches of his profession. His investigations concerning the cowpox were commenced about 1776, when his attention was excited by the circumstance of finding that some individuals to whom he attempted to communicate the smallpox by inoculation were not susceptible of the disease; and on inquiry he found that all such patients, though they had never had the smallpox, had undergone the casual cowpox, a disease common among the farmers and dairy-servants in Gloucestershire, who had some idea of its preventive effect. Other medical men were aware of the prevalence of this opinion, but treated it as a popular prejudice; and Jenner seems to have been the first who ascertained its correctness, and endeavored to derive from it some practical advantage. He discovered that the *variolæ vaccinæ,* or cowpox, as the complaint has been since termed, could be propagated from one human subject to another by inoculation, rendering all who passed through it secure from the smallpox. In 1798 he published a short treatise — 'An Inquiry into the Cause and Effects of the Variolæ Vaccinæ' — and in July 1798, Cline, surgeon to St. Thomas's Hospital, introduced vaccination into that institution. The practice was adopted in the army and navy, and in the country generally, and soon spread to other countries, and honors and rewards were conferred on the author of the discovery. In 1802 a parliamentary grant was made to him of the sum of £10,000, and five years later a second grant of £20,000. Besides the treatise already mentioned, and 'Further Observations on the Variolæ Vaccinæ or Cow-Pox,' Jenner also published various letters and papers on the same subject, as well as on others. A famous paper of his on the cuckoo appeared in the 'Philosophical Transactions' in 1788. Consult: Baron, 'Life of Jenner'; Creighton, 'Jenner and Vaccination' (1889); Crookshanks, 'History and Pathology of Vaccination' (1890). The

last-named work contains reprints of the 'Inquiry,' the 'Further Observations,' and other papers by Jenner. See VACCINATION.

Jenner, Katherine Lee Rawlings, English novelist: b. Hayle, Cornwall. She was married to Henry Jenner, and has published: 'A Western Wildflower' (1882); 'In London Town' (1884); 'Katharine Blythe' (1886); 'An Imperfect Gentleman' (1888); 'Love or Money' (1891); 'When Fortune Frowns' (1895); 'In the Alsatian Mountains.'

Jenner, SIR **William,** English physician: b. Chatham 1815; d. London 12 Dec. 1898. He was educated at University College, London, became in 1848 professor of pathological anatomy, and in 1857 of clinical medicine in that institution, and in 1861 physician to the queen. In 1862 he was appointed professor of the principles and practice of medicine in University College; in 1868 was created a baronet, and in 1872 a K.C.B., in recognition of his services during the severe illness of the Prince of Wales, now Edward VII. In 1881 he was elected president of the College of Physicians. He wrote various papers on specific diseases, and was the earliest to establish the difference in kind between typhus and typhoid fevers.

Jennings, jĕn'ĭngz, **Samuel,** American colonial Quaker preacher: d. 1708. In 1680 he came from Buckinghamshire, England, to Burlington, N. J., and was governor of West Jersey in 1683. Becoming entangled in religious controversy he opposed the Quaker schismatic, George Keith, and in London in 1694, supported the action of the American Friends in regard to Keith. On returning to America he often made preaching tours through the various colonies, and after the recall of the English governor, Lord Cornbury, aided in restoring public order in the affairs of West Jersey.

Jennings, Sarah, DUCHESS OF MARLBOROUGH. See MARLBOROUGH, DUKE OF.

Jephson, jĕf'sŏn, **Arthur Jermy Mounteney,** English writer of travels. He commanded a detachment under the explorer, Stanley, in the Emin Pasha relief expedition, was queen's messenger 1895–1901, and has been king's messenger from the latter date. He has published: 'Emin Pasha and the Rebellion at the Equator'; 'Stories Told in an African Forest'; 'The Story of a Billiard Ball' (1897).

Jephthah, jĕf'thą, in Jewish history one of the judges of Israel (Judges xi., xii.). He was a son of Gilead, and was driven from home by his brothers, but when the Ammonites made war against Israel was summoned to defend his countrymen. Jephthah after trying conciliatory measures without success, put himself at the head of the Israelites, and defeated the enemy. He had made a vow that if he was victorious he would sacrifice to God as a burnt-offering whatever should first come to meet him from his house. He was met by his daughter, his only child, whom he accordingly sacrificed to the Lord (Judges xi. 29, 40). The way in which the vow was kept has given rise to much controversy, some authors maintaining that Jephthah put his daughter to death; others that he devoted her to perpetual virginity; others that he actually sacrificed her as a burnt-offering, and that, though prohibited by law of Moses, these human sacrifices occasionally took place.

Jep'son, Edgar, English novelist: b. London 28 Nov. 1864. He was educated at Oxford and has published: 'Sibyl Falcon' (1895); 'The Passion for Romance' (1896); 'The Keepers of the People' (1898); 'On the Edge of the Empire' (1900); 'Lady Noggs, Peeress' (1904).

Jerboas, jĕr-bō'ąz or jĕr'bō-ąz, small rodents of the family *Dipodidæ,* found in the sandy plains of Africa, Russia and southern Asia, and represented by a few species in North America. Their most prominent peculiarity is the great length of the hind legs, especially in the metatarsal portion, so that they look like miniature kangaroos. They walk ordinarily on their two hind feet, but when alarmed escape danger by long leaps. They are fawn-colored, as a rule, with long slender tails, large ears, big eyes, and nocturnal habits. They dwell in underground burrows and tunnels, many of which, more or less connected, are likely to be found together. Their food is mainly vegetable, but they also eat insects, eggs, etc.; they hibernate in cold climates, do not store food, and are the prey of foxes, jackals, wildcats, serpents, and Arab children. The most familiar species of jerboa is the Egyptian form (*Dipus ægypticus*), found in North Africa in arid places. The jumping-hare of South Africa (*Pedetes capensis*), and its ally, the jumping-mouse of North America (*Zapus hudsonius*), are also well-known examples of the family. The latter is a reddish "mouse," white underneath, which abounds all over the temperate parts of the country, and is easily recognized by its bounding gait. It is one of the longest and soundest of winter sleepers, preparing for its dormancy a warm ball-like nest of grass lodged in a bush or among strong weeds. Gerbils (q.v.) of Africa and India are often confused with jerboas, but are a group of true mice. Consult Lydekker, 'Royal Natural History,' Vol. III. (1895).

Jeremiah, jĕr-ę-mī'ą, the second of the four major prophets of the Old Testament, the son of Hilkiah, of the priests that were in Anathoth, a town about three miles from Jerusalem. He flourished during the darkest period of the kingdom of Judah, under Josiah, Jehoiakim, Jeconiah, and Zedekiah, having been called to the prophetic office in his youth, in the 13th year of the reign of Josiah 626 B.C. He continued in it till the 11th year of Zedekiah, when Jerusalem was taken by Nebuchadnezzar (588 B.C.). His task was to deliver messages and warnings to a corrupt people and to foretell the destruction of the nation. In Judah were two political parties — the one favoring an Egyptian alliance, the other a Chaldæan. Jeremiah repudiated both at first, but was driven over to the latter and unpopular party. He became the leader of this minority in contending with three features of popular infatuation — religious apostasy; neglect of justice; and false patriotism, which led the people frequently to break faith with Babylon, by bursting into revolt. He characterized Nebuchadnezzar as the servant of God, and prophesied the approaching burning of the temple. A cry for his life arose from the priests and prophets, and he escaped with difficulty. At last Jerusalem with its temple and palace was consumed with fire. Jeremiah was favorably

treated by the Babylonian conqueror, and offered a home at Babylon, but preferred to stay among the people left in Judah. One section of this party thought they saw in Egypt a safe place of refuge from the power of Nebuchadnezzar, and led the people together with Jeremiah to Tahpanhes, where, according to Christian tradition, the prophet was stoned to death by his countrymen, who were incensed by his rebukes. According to the Rabbinical tradition, however, he and Baruch made their escape on the conquest of Egypt by Nebuchadnezzar.

Jeremiah, Lamentations of, the title given by the Septuagint translators, by the Vulgate and English Bible, to a book of songs and dirges which is placed next to the book of the prophecy of Jeremiah. The book is divided into five chapters each of which contains a complete composition. In I., II. and IV. the death of the Jewish nation is bewailed with the utmost abandonment of grief. The form of each elegy is poetry of the most strictly artificial kind. The metre is that of the Kinah (q.v.), the metre employed in dirges from immemorial time in the east. As if to run down the whole gamut of sorrow each verse begins with a different letter of the Hebrew alphabet, arranged, generally, in the usual order.

The whole work may be thus briefly analyzed. Elegy 1: Lamentation over the city after the people have been swept off into captivity. Help is asked from Jehovah. Elegy 2: The destruction of the city mourned over. Jehovah again called upon as alone able to save. Elegy 3: Sufferings of "Jehovah's servant," a personification of the whole pious multitude, described. Elegy 4: Contrast between former gladness and the present misery, which is attributed to national transgression. Elegy 5: A final appeal for help in prayer to Jehovah.

The date and authorship of the Lamentations are matters of dispute. Few modern critics attribute them to Jeremiah. They show traces, however, of that prophet's language and sentiment, but internal evidence is not conclusive. Some think that they are referred to in 2 Chronicles xxxv. 25. Consult: 'Commentaries' of Payne Smith; Cheyne; Plumptre; and Löhr, 'Die Klagelieder Jeremias' (1894).

Jeremiah, The Prophecy of, a book of the Old Testament containing the utterances of that prophet. The writings of Jeremiah, or certain of them, were taken down by his pupil and friend Baruch. They must therefore have been originally spoken without being previously written out, although it is possible that the scribe or secretary took them down at his master's dictation. The roll of Baruch contained all that Jeremiah had spoken for 23 years; probably, therefore, many of the prophecies may have been sketched merely as outlines. The substance of these impassioned appeals is imbued with firm belief in God's unfailing covenant with Israel and with David. Although Jeremiah is not so often quoted by New Testament writers as is Isaiah, yet there is abundant evidence in their writings that they read him, and he is not only a prophet of denunciation and warning but also of Messianic hope and promise. He shows, moreover, an intimate acquaintance with Deuteronomy, the utterances of his prophetic predecessors, and the book of Psalms.

The books seems naturally to be divided into five parts, the first of which contains six discourses, each of the last three introduced by the formula of sanction, "The word which came to Jeremiah from the Lord." Each of these discourses includes sketches, outlines or skeletons of different prophecies each by a distinct formula of sanction. Take for instance, the first discourse (1 ch. to 20 ch.), the first sketch would be in the first chapter, verses 4 to 10, introduced by the formula, "The word of the Lord came unto me saying." There are at least four of these brief sketches in the first chapter.

The second part of the book consists of 15 prophecies, which are fuller and completer than those of the first part, each with its formula of sanction. They include poems, appeals, allegorical object-lessons, historic narratives, and one letter. The third part is a connected narrative in classic Hebrew, different in style from that of the first 20 chapters. The fourth part contains poetic invectives against Egypt, Philistia, Moab, Ammon, Edom, Damascus, Hazor, Elam and Babylon. The fifth part is a supplementary, adding details to the description of Jerusalem's downfall.

Jerfalcon, jĕr'fâ"kn, or **Gyrfalcon,** a large and bold falcon of the Scandinavian mountains (*Falco gyrfalco*), represented by closely allied species or varieties in Iceland, Greenland and the Hudson Bay region, whose plumage is prevailingly white, with more or less blackish markings, especially about the face. It is one of the largest, strongest and most impetuous of its race; and has always been highly prized by falconers, among whom, by ancient laws, its use was restricted to men of ducal and princely rank. The bird is a rare winter wanderer to the United States from arctic Canada, where it breeds, and survives the winter mainly by killing ptarmigan.

Jericho, jĕr'ĭ-kō, a once important city of ancient Palestine, near the foot of the mountains, on the west side of the Jordan plain, northeast of Jerusalem. Its name means "city of palms." The site is marked by mounds of sun-dried bricks, and called Tel es-Sultan; gardens and a fine spring are found there. The palms and balsams for which Jericho was formerly famed have disappeared. At the conquest of Palestine by Joshua, Jericho was the key to the country and was miraculously captured, destroyed by fire, and its rebuilding forbidden under a curse. It is now a poor village, much visited by tourists. It has two hotels, a Russian monastery and church.

Jerked Beef, beef cut into strips of about an inch thick, and dried in the sun. This method of preserving meat has been largely adopted in South America and Australia. Cut from the animals when in good condition these strips of flesh dry in the sun before decomposition commences, and will keep for any length of time. In the United States, jerked beef is common in the southwest, where the Indians prepared buffalo, deer and bear meat by cutting in strips and curing in the sun.

Jeroboam (jĕr-ō-bō'am) **I.,** the first king of Israel, the northern kingdom. Having conspired against Solomon, he was obliged to escape to Egypt, where he remained until the monarch's death. He then returned to lead an insurrection

against Rehoboam, which ended in the formation of the kingdom of Israel, composed of the 10 revolted tribes. These tribes worshipped at Bethel and Dan, instead of going to Jerusalem. Jeroboam reigned from about 937 B.C. to 915 B.C.

Jeroboam II., king of Israel. He was the son of Joash. He reigned from about 782 B.C. to 741 B.C. His reign was evidently an active one. He was a skilful warrior, and regained territory which had been captured by the king of Aram in previous reigns. It was during Jeroboam's time that Hosea and Amos announced their prophecies.

Jerome, jĕ-rom' or jĕr'ōm, **Saint** (EUSEBIUS HIERONYMUS SOPHRONIUS), a father of the Latin Church: b. Stridon, between Styria and Hungary, about 331. His parents educated him with care in literary studies and he read the Greek and Roman classics at Rome under the famous grammarian Donatus. He did not escape uncontaminated by the licentiousness of the capital; but soon became inclined to the Christian faith. The catacombs and tombs of the martyrs first excited his devotion. His travels on the Rhine and in Gaul made him acquainted with several Christian preachers, and he was eventually baptized. After a long residence at Aquileia he went in 373 to Antioch in Syria, where he passed through a spiritual crisis and renounced pagan learning, and in 374 retired to the deserts of Chalcis. There he spent four years as a hermit in the severest mortifications and laborious studies. He left his solitude again to be ordained priest at Antioch, but soon after went to Constantinople to enjoy the instruction of Gregory Nazianzus. In Rome, where he became literary secretary to Pope Damasus, he made his appearance as a teacher. His exposition of the Holy Scriptures found favor with the Roman ladies. Marcella and Paula, rich patricians, are celebrated for the learned and ingenious theological epistles he wrote them, and for their rare monastic piety. Paula accompanied him to Palestine in 386, where he founded a convent at Bethlehem; here he remained till his death in 420. His writings show his active participation in the controversies of his day, and his letters give a very vivid idea of the condition of society at Rome. They are full of satiric strictness on the corrupt clergy, and are often as biting as Juvenal or Martial. Many of them are profoundly touching and full of fervent piety; others are lampoons traversed with vehement invective with the spirit of Plautinian ribaldry. His Biblical labors are highly valuable; his Latin version of the Old Testament from the original language is a marvellous achievement, and it may be said that ecclesiastical Latin, originated with Jerome's Vulgate. His principal claim to the gratitude of the Church is that he was the founder of Latin monasticism. Consult Largent, 'Saint Jerome' Sanders, 'Etudes sur Saint Jerome' (1903).

Jerome, Jerome Klapka, English humorist: b. Walsall 2 May 1861. He was at first a clerk in a railway office, afterward actor, schoolmaster, and journalist by turns. After many discouragements he succeeded in making a popular hit with his book, 'On the Stage — and Off' (1885), largely autobiographical; and his 'Idle Thoughts of an Idle Fellow' (1889) and 'Three Men in a Boat' (1889) made him famous in America as well as at home. He edited the 'Idler' with Robert Barr (q.v.) (1892–7); 'To-Day' (1892–7); and has published several successful comedies: 'Sunset' (1888); 'New Lamps for Old' (1890); 'Miss Hobbs' (1900); etc.; and also 'John Ingerfield and Other Stories' (1894); 'Sketches in Lavender' (1897); 'Observations of Henry' (1901); 'Paul Kelver' (1902); etc.

Jerome, William Travers, American lawyer and politician: b. New York, 18 Apr. 1859. He entered Amherst College, but failing heart compelled him to leave. He graduated from the Columbia Law School in 1884. In 1888 he was appointed assistant district attorney, in which position he saw much of the political corruption prevailing in the city. In 1890 he was active in the Municipal League, which opposed Tammany; in 1893 was assistant counsel of the Lexow Committee, in 1894 a member of the committee of 70, and manager of the campaign which resulted in the election of Mayor Strong. In the same year the mayor appointed him judge of the court of special sessions. In 1901 he was active in the Fusion campaign against Tammany; and in 1902 was elected district attorney of New York County; immediately after his election he established headquarters in the East Side of New York, in order to be within easy reach of the people who most needed his assistance; in this official position he has done very effective work in the breaking down of the system of protection of vice and maladministration of justice. In 1905 he was again elected district attorney on an independent ticket by 16,255 plurality.

Jerome of Prague, Bohemian religious reformer: b. Prague about 1370; d. there 30 May 1416. He was educated at the universities of Prague, Paris, Oxford, Cologne, and Heidelberg; and was in faith and sufferings the companion of the famous John Huss, whom he excelled in learning and eloquence, and to whom he was inferior only in moderation and prudence. His reputation for learning was so great that he was employed by Ladislaus II. of Poland to organize the University of Cracow; and Sigismund of Hungary caused Jerome to preach before him in Buda. He took a zealous part at Prague in the contest of his friend Huss against the authorities, and not unfrequently proceeded to violence, causing the monks who opposed him to be arrested, and even had one thrown into the Moldau. He publicly burned in 1411 the bull of the crusade against Ladislaus of Naples, and the papal indulgences. When Huss was imprisoned in Constance he could not remain inactive, and hastened to his defense. But attempting to return to Prague the Duke of Sulzbach caused him to be arrested in Hirschau and carried in chains to Constance. After an imprisonment of half a year he consented on 11 Sept. 1415 to recant the heresies with which he and Huss were charged. But this recantation did not deliver him, and after languishing a year, he solemnly retracted his recantation. On 30 May he was burned at the command of the council, and his ashes thrown into the Rhine.

Jerrold, jĕr'ōld, **Douglas William**, English dramatist and humorist: b. London 3 Jan. 1803; d. Kilburn Priory, near London, 8 June 1857. He was a midshipman in the navy 1813–15, and

then quitting the service, was bound apprentice to a printer in London. By hard study he made himself master of Latin and Italian, besides acquiring an extensive knowledge of general literature, and at first attempted dramatic criticism. The bent of his genius, however, lay mainly in the direction of dramatic writing. Numberless pieces were produced by him before he was 20, but the first which won decided popularity was 'Black-eyed Susan,' represented for 300 successive nights at the Surrey Theatre in 1829. Among Jerrold's subsequent dramas were the 'Rent-day'; 'Nell Gwynne'; 'The Housekeeper'; Prisoner of War'; 'Bubbles of a Day' and 'Time Works Wonders,' the last named one of the most successful comedies on the English stage. He founded and conducted successively the 'Illuminated Magazine' and 'Douglas Jerrold's Shilling Magazine,' also acting as a most important member of the literary staff of 'Punch.' To this he contributed 'Mrs. Caudle's Curtain Lectures'; 'Punch's Letters to his Son'; the 'Story of a Feather.' He wrote several novels, among which are 'The Mad Mode of Money'; and 'Chronicles of Clovernook' (1846). A selection of his essays edited by his grandson, Walter Jerrold, appeared in 1903. Though a powerful master of satire, he never allowed his wit, whether as an author or in private life, to be tinged with malevolence. Consult: W. B. Jerrold, 'Life and Remains of Douglas Jerrold' (1859).

Jerrold, Walter Copeland, English author and journalist: b. Liverpool 3 May 1865. Since 1890 he has been connected with the editorial staff of the London 'Observer,' and beside editing several reprints from the works of his grandfather, Douglas Jerrold (q.v.); Thackeray's prose works, etc., has published: 'Michael Faraday: Man of Science' (1891); 'Gladstone: England's Great Commoner' (1893); 'Oliver Wendell Holmes' (1893); 'The Triumphs of the Printing Press' (1896); etc.

Jerrold, William Blanchard, English journalist and miscellaneous writer, son of Douglas Jerrold (q.v.): b. London 23 Dec. 1826; d. there 10 March 1884. He edited Lloyd's newspaper for a long period and published: 'Cool as a Cucumber,' a novel (1851); 'Swedish Sketches' (1852); 'Life of Douglas Jerrold' (1858); 'At Home in Paris' (1866); 'Up and Down in the World' (1866); 'Paris for the English' (3d ed. 1868); 'The Cockaynes in Paris' (1871); 'The Best of all Good Company' (1871); 'Life of Napoleon III.' (1874–84).

Jersey Cattle. See DAIRY CATTLE.

Jersey (jėr'zĭ) **City,** N. J., the most important suburb of New York since the annexation of Brooklyn, the second largest city in New Jersey, and seat of Hudson County. It occupies about five miles of the Hudson River frontage opposite lower New York: Paulus Hook, its starting point, is exactly opposite the Battery. It lies on a peninsula between the Hudson and New York Bay on one side, and the Hackensack and Newark Bay on the other; and is limited on the south by Bayonne, which takes up the lower end of the peninsula, and on the north by Hoboken. It has several ferry lines to different portions of New York, some of them operated by the great railroads which have their terminals here — all the roads from the south and west: the Pennsylvania, Erie, Baltimore & Ohio, Lehigh Valley, Delaware, Lackawanna & Western, New York, Susquehanna & Western, Central of New Jersey, and the West Shore line of the New York Central. The Morris Canal ends here. Jersey City is also the terminal of several of the most important steamship lines between New York and Europe. Its area is 12,228 acres, or 19.1 square miles.

The city lies on a flat meadow about a mile wide from the river back to a sharp bluff; the business section occupies the former, the residence district the latter, with some very handsome streets of costly dwellings — though Grand Street in the business section is a notably beautiful residence street. The municipal improvements are of a high and thorough grade: paving (nearly all the streets are paved, largely with granite and asphalt), sewerage, water supply, etc. The trolley service extends to all the neighboring section of New Jersey. The parks are few and very small, less than in almost any other large American city; but along the ridge in the western part extends the magnificent Hudson County Boulevard, 19 miles long (the entire length of that county from Bayonne up, and five miles of Bergen County), 100 feet wide, and with a noble view of the river and upper New York, as well as the country west. The city hall with the soldiers' monument, the public library, and the Fourth Regiment armory, are among the conspicuous buildings. The intellectual facilities of the city are good, aside from its proximity to New York. It has 27 public schools, besides 10 Roman Catholic parochial schools, and for higher education a public high school, Hasbrouck Institute (1856), St. Peter's (Roman Catholic) College (1878), St. Aloysius Academy, and the German-American School. There is a public library with over 100,000 volumes; and a historical museum rich in colonial documents. The hospitals are the City, St. Francis, and Christ; there are several homes and asylums, and some convents.

The immense commercial and shipping interests of the city, though second only to those of New York, have no separate statistics, the customs report being included in that of the latter city. Its position on the great river, with Newark Bay in the rear and the entrance of Kill van Kull on the south, give it a most favorable commercial position, which has been improved by properly equipped wharves. The Pennsylvania and Erie roads have large grain elevators here. Among the leading industries are those of slaughtering and meat-packing: Jersey City is the meat depot of New York, and has two huge abattoirs, one on the river front and the other on the Hackensack meadows in the northwest. Its slaughter-house products in 1900 amounted to $5,708,763. Its other manufactures are enormous, the total amounting to $77,225,116 in 1900. They are exceedingly varied, no one having a great predominance except the tobacco manufacture, over $6,000,000 a year; other important branches are iron and steel goods, locomotives, boilers, and heating apparatus; bridges, ships, and windmills; planing-mill products, cars, carriages, boxes, and cooperage; brass, copper, and zinc goods, electrical and scientific apparatus; pottery and glass; lead-pencils, and famous crucibles used in all chemical laboratories and smelting works; watches,

jewelry, and musical instruments; sugar, and confectionery; mineral waters and patent medicines; soap and candles (a natural annex to the abattoirs), and perfumes; compressed gas; chemicals, paints, and roofing materials; paper, and window-shades; rubber goods; silk thread and goods; oakum; fireworks; printing and writing inks, and varnish; and hundreds of others. There are four national banks, and several State and private banks, with loan and trust companies.

The city has a two-year mayor and a council with only one chamber, called the board of aldermen; most of the other officials are appointed by the mayor, only the city clerk being appointed by the aldermen, and the street and water board elected. The assessed valuation in 1902 was $100,550,026; the total public debt, excluding the water debt, $16,205,325; the sinking fund is above $3,000,000. The expenditures are about $8,000,000 a year. The largest single item is $460,000 for schools.

The population in 1850 was 6,856; 1860, 29,226; 1870, 82,546; 1880, 120,722; 1890, 163,003; 1900, 206,433; 1905, 232,699. Of these 3,704 were colored, 58,224 foreign-born, 19,314 Irish, 18,820 German, 4,642 English, 3,832 Italian.

The site of the city was used only as farming land till into the 19th century despite its remarkable position. In 1802 the entire population was 13 in one house with outbuildings; this was on Paulus Hook, the point opposite the Battery, named after the Dutchman Michael Pauw, who formerly owned it. Here in the Revolution the American fortifications had been taken by the British, and retaken and destroyed in a most brilliant action by "Light Horse Harry" Lee. In 1804 the "associates of the Jersey Company" bought the land, and laid it out in streets, incorporating it as a village with a board of selectmen. In 1820 it was incorporated as the "City of Jersey," still with a board of selectmen; in 1838 it was reincorporated as Jersey City, with a mayor and aldermen. Repeated annexations have brought it to its present territory: Van Vorst in 1851, Hudson City and Bergen in 1869, Greenville in 1873. It obtained a new charter in 1889. Consult: McLean, 'History of Jersey City' (1895); Eaton, 'Jersey City and its Historic Sites' (1899).

Jersey, Island of, the largest and most important of the Channel Islands, lying in the English Channel, and belonging to Great Britain. It is 12 miles long and from 4 to 7 miles wide, and has an area of 45 square miles. The distance to the coast of France is about 12 miles. The interior is mostly table-land and is well-wooded. The principal town is Saint Helier. The island is famous for a breed of cattle. Pop. (1901) 52,796.

Jersey Prison Ship, a notorious, unseaworthy ship, lying in New York harbor from 1776 to 1783, and used by the British as a prison for captured American sailors. Over 11,000 are said to have died of cold, starvation, and inhuman treatment.

Jer'seyville, Ill., city and county-seat of Jersey County, on the Chicago & A. and the Chicago, P. & St. L. R.R.'s., 66 miles southwest of Springfield. It was settled in 1839, incorporated in 1867, and adopted a new city charter in 1897. It has a public library and court-house, and being the centre of a rich agricultural district, has an established trade in produce, fruit, grain and live-stock. The waterworks are owned by the city. Pop. (1900) 3,517.

Jerusalem (Greek *Hierousalem.* Old Hebrew pronunciation, *Yurushalem.* Tel-el-Amarna tablets, *Uru-sa-lim*; Assyrian monuments, *Ur-sa-li-im-mu.* Meaning certainly "city of Salim"; meaning of *Salim* disputed — probably an Assyrian god; usually assumed as Hebrew "peace," but the name antedates Hebrew. The Greek and Latin *Hierosolyma* is a corruption, from the erroneous supposition that the first syllable is Greek *hieros,* sacred. Hadrian renamed it *Ælia Capitolina,* and its official name was long *Ælia,* even Arabicized into *Iliya;* the Greeks called it *Kapitolias.* Arabic name, *Beit el-Makdis,* or simply *el-Mukaddas,* modern vernacular *el-Kuds,* "the sanctuary," or *el-Kuds esh-sherif*).

The "Holy City" is 33 miles from its port of Jaffa on the Mediterranean, 15 from the Dead Sea, 18 from the Jordan, 19 from David's first capital, Hebron, and 34 or 35 from the old kingdom of Samaria: the pregnant Hebrew history was transacted in the space of a county. It is 126 miles from Damascus. The position of the dome of the Church of the Holy Sepulchre is lat. 31° 46′ 45″ N., lon. 35° 13′ 25″ E. The city lies in the midst of an infertile, ill-watered district, once (under good government) made prosperous by irrigation, now blighted by Turkish possession. The rainfall is about 23 inches. The climate is hot and irregular — rising to 112° and not sinking below 25°, with an annual mean of 62° — but not malarious; the city is unsanitary and plague-stricken, but from dirt, lack of sewerage, bad water, and unhygienic habits. The only natural water-supply (the drainage sinking in the soft limestone) is from the Virgin's Spring (Gihon), an intermittent natural siphon on a dolomite floor, in a rocky cave 12 feet deep in the face of the eastern ridge; this was carried by a rock and masonry conduit to the rock and masonry Pool of Siloam, 52 x 18, and thence to another, the Old Pool; a shaft within the walls led down to a rock channel communicating with the spring. At present the water-supply is from rain-tanks or "pools," in and out of the walls. The remaining one of three old aqueducts, which carries water when in repair, was built by Pilate. There is little trade except that of local shops for supplying tourists; and the manufacture is chiefly of souvenirs, as olive-wood and mother-of-pearl articles. Indeed, as a commercial location it never possessed any merits, and its greatness was due to original political situation, and partly to its very defects. It is connected with Jaffa (west), Bethlehem and Hebron (south), and Jericho (north) by carriage-roads; and in 1892 a narrow-gauge railroad to Jaffa, with a circuitous course of 54 miles, was opened by a French company.

Jerusalem lies on several hills, rising from a steep plateau (see below), and the floor and slopes of a valley between the two main divisions. The modern city, much less extensive than the old in its best estate, is a rough quadrangle surrounded by a very irregular wall, built in the 16th century by Solyman I., on the lines of the Crusaders' fortifications. It has nominally eight gates, two on each side; the

Jaffa and Abd-ul-Hamid on the west (the latter very recent), the Zion and Dung on the south, the Golden (closed up) and St. Stephen's on the east, and the Damascus and Herod's on the north. The city is unevenly divided, by the main street running from the Damascus gate south to near the Zion gate, and that running east from the Jaffa gate to the Haram-esh-sherif, into four "quarters" in which the great religious divisions are segregated: the Mohammedan, much the largest, on the northeast, adjoining the original holy places; the Christian next, on the northwest, where is the Church of the Holy Sepulchre; the Armenian on the southwest; the Jewish on the southeast. The streets are crooked, narrow, ill-made, and dirty, and the city has few except historical attractions; the stream of tourists, however, has developed civilized conveniences such as hotels, banks, mercantile establishments, etc. Several Jewish colonies have been settled in the environs; and since 1858 a quarter has grown up outside the walls on the northwest, approached by the Jaffa Gate, and containing consulates, Christian churches, schools, charitable institutions, etc., but not more sanitary than the old. The city is the capital of an independent sanjak, or Turkish administrative district, immediately subject to the government at Constantinople, and has an executive and a town council with representation of the great religious divisions. It is the seat of Roman Catholic, Greek Catholic, and Armenian patriarchs; the smaller Eastern churches have resident bishops; and till 1887 a joint Protestant bishopric was supported by England and Prussia, with alternate bishops, but on the death of the then incumbent Prussia withdrew from the arrangement, and England continues it alone. The population of the city at the last returns was as follows: Jews, 41,000; Mohammedans, 10,000; Christians, 12,800 — made up of 6,000 Orthodox Greeks, 4,000 Roman Catholics, 1,400 Protestants, 800 Armenians 200 Uniat Greeks, and small bodies of Syrians, Copts., etc. Total, over 60,000.

The intense historical interest is centred on memorials of the time or localities of David and Solomon, and of the life and death of Christ. Of the former, the supreme interest is in the Haram-esh-Sherif, the site of the temple, and palace of Solomon and of the later temples. It is a walled area about 527 x 330 yards, with an elevated platform in the centre reached by steps; in the centre is the beautiful Kubbet es-Sakhra, or Dome of the Rock — a wooden octagon with sides of 66 feet 7 inches, decorated on the outside with marble and porcelain tiles, each of the four sides which face the cardinal points having a square gate surmounted by a vaulted arch. Just east of this is the Chain Dome, or David's Place of Judgment. Other domes of interest are near; but the next most notable structure in the Haram is the mosque El Aksa, at the south end. Within it are also a beautiful 15th-century fountain, a pulpit of the same date, a modern mosque called the Throne of Solomon, and the fortress of Antonia. Of the Christian monuments, the most noteworthy is the Church of the Holy Sepulchre, in the Christian quarter, originally built by Constantine the Great over the supposed place of the Ascension; after long oscillation of views, and for a time a general abandonment of the site as the true one, opinion is again favoring its authenticity. Most of the present structure, however, dates only from the 19th century. There is a rotunda, with a dome 65 feet in diameter, above a small Chapel of the Sepulchre; a number of church buildings, said to include the site of Golgotha or Calvary; and 22 chapels. The Via Dolorosa, along which Jesus is said to have carried the cross to Calvary, follows the present street Tarik Bab Sitti Maryam from St. Stephen's Gate. Several modern churches and other institutions are also worth visiting; but the thronging Scriptural associations — besides those mentioned above, the Mount of Olives, the Pool of Bethesda, the Vale of Hinnom, etc. — overshadow all else.

Topography and History.—About a mile north of Jerusalem, the main north and south watershed ridge of Palestine turns to the west; while a spur called Olivet, having three pinnacles, runs first southeast 1½ miles, and then south 1¼ miles. The space between the two is occupied by a plateau sloping southeastward, and separated on each side from the bounding ridges by a ravine 300 to 400 feet deep, with steep and often precipitous sides. The eastern ravine, separating it from Olivet, is the "brook" Kedron or Kidron (Cedron), which was always a dry bed; the western is the Wady el-Rabâbi (probably the vale of Hinnom), which after skirting it on the west, turns east along the southern scarp of the plateau and joins the Kedron. Through this plateau from north to south runs a broader and much less deep and precipitous valley, the Tyropœon ("cheese-makers' place") 100 to 150 feet deep, thus dividing it into two uneven sections: the east ridge is continuous, and its northern part was the first occupied; the western part, the "new city," is divided by a lateral branch of the Tyropœon into two summits, a north and a south, connected by a narrow saddle separating also Tyropœon from el-Rabâbi. The general height may be stated as about 2,500 feet; the eastern ridge is 2,440 feet at the north, and descends southward; the western north summit is 2,490 feet, south summit 2,520. The accumulation of 3,000 years' rubbish, however, has greatly modified the contours of the hills and ravines, obliterating some minor ones altogether. The average depth over the rock levels is 30 to 40 feet, and in the valleys 70, in one case reaching 120.

This plateau, surrounded on three sides by steeply scarped bluffs and crested with hills, was a natural fortress; but it had two defects — it commanded nothing in particular, and its water-supply (one spring intermitting for hours or even a day or two, and that at the foot of a bluff) was very scanty. Probably at the first, as many times since, army after army marched around it, and left it untouched as of too little military significance. We first hear of it on the Tel el-Amarna tablets (about 1400 B.C.), when it is seemingly a little hill fort with a small garrison, possibly with a village also, and the capital of the "land of Jerusalem," apparently a small territory along the watershed. The king, Abd-Khiba, is a vassal of the king of Egypt, and begging assistance against the Khabiri (Hebrews?). Later it is a minor "Jebusite" citadel: Hebron, Bethlehem, Bethel, Gibeah, Jericho, are all more important. But when David undertook to form a consolidated Hebrew kingdom, Jerusalem had the transcendent merit that it lay on the border between Judah and the northern tribes, not historically identified with either; it

THE MOSQUE OF OMAR, JERUSALEM.

was also fairly on the central line of communication, and convenient for action against the Philistines and the desert tribes at once. He made terms with the Jebusites and occupied the hill-fort of Zion on Ophel, near the only available water-supply. Possibly a village grew up on the eastern slope of the hill; but it was small, for the whole levy of Palestine was but 30,000 men (2 Sam. vi. 1), and other places held the trade. Solomon greatly increased the size of the town, and built a stone temple for Yahweh and a great palace. Under Rehoboam the place was captured by Shishak of Egypt; under Amaziah by Jehoash, and its walls partly leveled. During the palmy times of the northern kingdom it was held of small account except by the Judahites: it was only one of many places of pilgrimage down to Hezekiah's time, and the northern prophets ignore it and speak of Bethel, Gilgal, and Beersheba. With the fall of its northern neighbor, for the moment its importance and wealth increased; especially it became the one undefiled shrine, never mixed with rites of the native religions, the centre of Jewish religious life, the one place where sacrifice might be offered. In the later days of the monarchy the town spread beyond the east ridge into the Tyropœon; a second town and a trading quarter grew up. For a long time after its destruction by Nebuchadnezzar in 586 the history is scant and dubious. It suffered heavily under the Persian empire; under Artaxerxes Ochus the temple *may* have been destroyed. Alexander's sacrificing in the temple is mythical; and in 320, Appian says, Ptolemy Soter destroyed the city. Then there was a time of peace and prosperity, culminating in the high-priesthood of Simon II. (219–199 B.C.); after a series of struggles between the Ptolemies and the Seleucids, in which the former took and garrisoned the place and the Jews helped drive out the garrison, the Seleucids obtained Palestine by treaty in 197. When Antiochus Epiphanes undertook to Hellenize Palestine in 169, he took the city, destroyed the walls, plundered the temple, and erected an altar to Zeus in place of that to Yahweh. Judas Maccabæus rebuilt the temple and the walls; again razed by the Greeks, they were again rebuilt by Jonathan. Under the Hasmonæan dynasty it extended to the western ridge; there was a new palace and royal quarter of great splendor; the city became the metropolis of the Jewish world, and the one great pilgrim shrine. Then it became tributary to Rome, but at least still a kingdom governed by its own sovereigns; such it was when Jesus was born; but it shortly after became a province governed by a Roman procurator. The Roman system and Jewish feeling were incompatible, aside from any actual misgovernment; and a grand national revolt took place, which in 66 A.D. gained possession of Jerusalem. Vespasian was appointed to repress it; and in 70 A.D. his son Titus, after one of the most frightful sieges in history, with unimaginable horrors, took it, burned the temple, and leveled the city to the ground. Josephus says the city's population was 1,000,000, and Tacitus (probably from Josephus) 600,000; both are absurd, and Josephus' figures are always Oriental. From 30,000 to a maximum 45,000 may be estimated. It remained a ruin for many years. In 131 Hadrian visited the site and ordered it rebuilt; apprehending a restoration of pagan worship, the Jews broke out in rebellion under Bar-Cochba; and Hadrian, not caring to set up a new centre of Jewish propaganda, made it a Roman colony called Ælia Capitolina, and forbade Jews to enter it on pain of death. Thence till the time of Constantine nothing is known of it; except as a Jewish shrine it was nothing. When the empire became Christian, Constantine's mother, Helena, induced him to cherish the seat of Christ's ministry and death; and he built the Church of the Holy Sepulchre (see above). Pilgrims flocked to Jerusalem from all parts, and it became the shrine of Christendom. Captured by Khosru of Persia in 614, it was retaken by Heraclius in 628; but in 637 was taken by the Moslems under the caliph Omar. The line of Arabian caliphs of different dynasties was succeeded by the Seljuk Turks. The Christians were oppressed, the sacred places defiled; to crown all, the overland caravan trade was cut off. Religious feeling and mercantile interest together roused Europe to the crusades, and Jerusalem was taken by Godfrey of Bouillon in 1099, becoming the capital of a Christian monarchy. This maintained a precarious existence till 1187, when the great Saladin put an end to it.

Among the many excellent works on the subject see, for topography and ancient history, the article Jerusalem in the "Encyclopædia Biblica," by W. R. and G. A. Smith and Col. Conder; also for topography, Col. Conder in Hastings' 'Dictionary of the Bible.' See also Warren and Conder's 'Jerusalem' (1884, Palestine Exploration Fund), containing a large portfolio of plates; Wilson's 'Ordnance Survey of Jerusalem' (1868), the basis of all modern work; De Vogue's 'Temple de Jérusalem' (1864); Le Strange's 'Palestine under the Moslems' (1890, Palestine Exploration Fund), the only book based on Arabic writers; Besant and Palmer's 'Jerusalem, the City of Herod and Saladin' (4th ed. 1899); and the 'Quarterly Statement' of the Palestine Exploration Fund.

Jerusalem Oak. See GOOSEFOOT.

Jerusalem Plank Road, Engagement near. After the battle of Cold Harbor (q.v.), 1–3 June 1864, Gen. Grant crossed to the south of James River, made unsuccessful assaults upon the Petersburg intrenchments, 15–18 June, and then determined to invest the city partially by a line of works toward the South Side Railroad, and by the evening of the 21st the Fifth corps rested its left on the Jerusalem Plank Road. The Second corps, followed by the Sixth, was moved across the road with the intention of seizing the Weldon Railroad at a point near Globe Tavern next day, and with the expectation of seizing also the South Side Railroad, and cutting Lee's communication with Lynchburg. At night the Sixth corps was in rear of the left of the Second. The orders for the 22d were that the Fifth corps should hold fast its position in front of the Confederate intrenchments, while the Second and Sixth swung to the right, and forward on its left, each division intrenching as it came into line. In the movement the corps commanders at first were directed to keep up connection, then they were ordered to move without regard to each other, each taking care of his own flanks. The Second and Sixth corps moved chiefly through densely wooded thickets; the Second on the right and near the Confederate works; the Sixth at right angles to the Second

toward the Weldon Railroad. Gibbon's division of the Second corps had swung in on the left of the Fifth and intrenched. Mott's division was intrenching, and Barlow's division, on the left, was not yet in position, when the last named was attacked. Gen. A. P. Hill had been sent down the Weldon Railroad to oppose Meade's attempt upon it. He had the three divisions of Wilcox, Mahone, and Bushrod Johnson. Leaving Wilcox to oppose the Sixth corps, which had not come up on the left of the Second, Hill, about 3 P.M., passed Mahone and Johnson through the opening between the two corps and struck Barlow in flank and rear, driving him back in confusion to the position from which he had advanced in the morning, and taking many prisoners. Mott's division, on Barlow's right, fell back precipitately, and then Hill struck Gibbon's left brigade in front, flank and rear, causing it to give way and abandon a battery of four guns. So sudden and unexpected was this attack upon Gibbon that the greater part of several regiments were captured with their colors. Gibbon made an unsuccessful effort to recover the lost portion of his line. Hill returned to his intrenchments, leaving some force on the railroad, and toward evening the Second corps was thrown forward; but it was not until next morning that it occupied the ground from which it had been driven, the Sixth corps, forming on its left, thrown back facing the Weldon Railroad, and about a mile from it. The Union loss on the 22d, confined almost entirely to the Second corps, was nearly 2,000, of whom about 1,700 were prisoners. The Confederate loss is unknown. Consult: 'Official Records,' Vol. XL.; Humphreys, 'The Virginia Campaign of 1864–65'; Walker, 'History of the Second Army Corps.'

E. A. CARMAN.

Jervis, jĕr'vĭs, **John Bloomfield,** American civil engineer: b. Huntington, N. Y., 14 Dec. 1795; d. 12 Jan. 1885. He was employed as axeman on the route of the Erie Canal in 1817; in 1819 became a resident engineer of the middle portion of the canal; was chief engineer of the Delaware and Hudson Canal and Railroad Company, 1825–30; and chief engineer of the Croton Aqueduct, 1836–43. In later life he was consulting and chief engineer of the Cochituate water works, Boston, and of several important railways. He built the Croton dam, the High Bridge at New York, and other notable structures. The town of Port Jervis (q.v.), N. Y., was named for him. He published: 'Railway Property'; 'Construction and Management of Railways'; 'Labor and Capital.'

Jesse, jĕs'ē, in the Bible stands at the head of the house of David, who was his son. While Saul was persecuting David he took refuge in the land of the Moabites, where Ruth the Moabitess, his grandmother, had lived. In the genealogy of Jesus Christ as given in the Gospels of SS. Matthew and Luke he is mentioned as one of the ancestors, as Christ in the New Testament is hailed "Son of David." This fact has suggested some of the most interesting creations of mediæval art, and what is called a "Jesse window" is a stained glass church window in which Jesse is depicted as the root of a tree which bears as its fruit David and other heroes and saints of the Old Testament, with the infant Jesus in the arms of his mother on the highest branch.

Jesse, Richard Henry, American college president: b. Epping Forest, Lancaster County, Va., 1 March 1853. He was graduated from the University of Virginia in 1875, was dean of the academic department of the University of Louisiana from 1878 till its union with Tulane University in 1884, in which institution he was professor of Latin till 1891. Since January 1891 he has been president of the University of Missouri.

Jes'sop, Augustus, English Anglican clergyman and author: b. 20 Dec. 1824. He was educated at Cambridge and after taking orders in the English church was curate of Papworth St. Agnes, Cambridgeshire, 1848–54; head master of Helston Grammar School, Cornwall, 1855–9; and head master of King Edward VI.'s School, Norwich, 1859–79. He has been rector of Scarning, Norfolk, from 1879, and is an honorary canon of Norwich Cathedral. As a writer he became widely known by his 'Arcady for Better for Worse' (1881), studies of agricultural life in Norfolk; and among other works of his are: 'Studies by a Recluse'; 'Trials of a Country Parson'; 'The Coming of the Friars' (1885); 'John Donne.'

Jest Book, a compilation of witty sayings and practical jokes. The oldest known English jest book is 'A Hundred Mery Talys' (about 1525). The best known collection is 'Joe Miller's Jest Book, or the Wit's Vade Mecum' (1739).

Jesuit (jĕz'ū-ĭt) **Relations and Allied Documents, The,** a series of 72 volumes on the travels and explorations of the Jesuit Missionaries in New France (1610–1791). The original French, Latin, and Italian texts, with English translations and notes; illustrated by portraits, maps, and facsimiles, and edited by Reuben Gold Thwaites. A republication of great magnitude and importance. The very great value of the work is that of original materials of the most interesting character for the history of North America from 1611, the date of the first landing of Jesuit missionaries on the shores of Nova Scotia. The reproduction of documents takes them in chronological order. The execution of the work by translators, editors, and printers (at Cleveland, Ohio) is every way admirable; and its completion will make a monumental addition to American historical libraries.

Jesuits, a religious order of the Catholic Church whose members, like those of similar societies, solemnly bind themselves to aspire to perfection by leading a life of chastity, by renouncing the possession of all personal property, and by obedience to lawful superiors in all that does not contravene the law of God. A certain number of them add a special vow of obedience to the Pope. They are called the Society or Company of Jesus, the latter designation expressing more correctly the military idea of the founder, which was to establish, as it were, a new battalion in the spiritual army of the Catholic Church. There are no female Jesuits, nor are there crypto or secret Jesuits. Romances are mostly responsible for such myths. Nor does the Society form, as is sometimes fancied, a sort of sect within the Church. R. W. Thompson, ex-secretary of the United

SITE OF SOLOMON'S TEMPLE, FROM THE NORTHWEST.

States navy, in his 'Footprints of the Jesuits' asserts that they are such, and independent of the pope, and in one instance he accuses them of being idolaters. As a matter of fact the Society of Jesus has always inculcated ardent devotion to the pope, the most uncompromising orthodoxy and an intense Catholic spirit. The descriptions of Jesuits as crafty, unscrupulous men constantly engaged in dark plots against all who stand in their way, are inventions of their enemies and have no foundation in fact. Finally they are not monks, as they are sometimes described. Technically they are classed among churchmen as clerics, living according to a rule and are properly regular clerics.
